The Melbourne *Herald* reports that in justification of its decision to buy electric locomotives in Germany, the Victorian Electricity Commission states that tenders were publicly called for three electric locomotives. Only four tenders were received, three being on behalf of German firms, and one from America. No tenders were submitted for the supply of plant of British or Australian manufacture. The lowest tender, that of the Siemens Schuckertwerke Co., of Berlin, was accepted through its agents, Gollin & Co., Ltd., of Melbourne. The Commission's action was endorsed by the Government. The general secretary of the Australian Association of British Manufacturers and their Representatives states, however, that under the guidance of German experts the Commission adopted German standards and, in addition to this, the time allowed was too short to enable British manufacturers to send in tenders.

Australian Ratepayers against American Engines.

The Melbourne *Age* reports that a meeting of the ratepayers of St. Arnaud (Victoria) recently passed a resolution protesting against the local Council's proposal to accept an American tender for a crude-oil engine for the electricity works. It was stated that three British tenders were received, all of them being lower than the American offer, and providing for an engine of greater power.

The British Electrical Development Association.

Annual Dinner.

THE annual dinner of the British Electrical Development Association was held at the Savoy Hotel, London, on March 17th. Sir James Devonshire, K.B.E., who had been elected president of the Association at the annual meeting the same day, occupied the chair; he was supported by a number of distinguished guests.

After the loyal toast, Dr. S. Z. de Ferranti rose to propose the toast of "Co-operative Publicity." He said that the Association's business was to advertise, in a general way, the benefits of electricity to the people. There were many kinds of advertising, from the direct propaganda of the producer to the more subtle methods of the professional man. To-day, advertising was absolutely essential; he was himself advertising his works by speaking that evening. The advertising of E.D.A. was, however, on a higher plane. It marshalled the resources of the industry to bring to the public notice the advantages of electricity; it was a work of education and of national importance. Much as E.D.A. had done, more remained to be accomplished. He thought that manufacturers were not spending enough on co-operative publicity; they should contribute more, even if it meant less individual advertising. The electrical industry was at a turning point. The Electricity Act was now an established fact, and he considered that the Government had done wisely in endeavouring to standardise electricity supply. Wishing the new Central Electricity Board success, Dr. Ferranti said that Sir Andrew Duncan had the great responsibility of bringing the various interests into harmony. It was E.D.A.'s task to educate the people and create the demand. Standardisation would involve great cost, but it would be justified by the benefits which it would bring.

The toast was responded to by the Rt. Hon. C. A. McCurdy, P.C., K.C. (President of the Advertising Association), who said that after examining the whole of E.D.A.'s publicity matter he considered it admirable; he had never seen more effective propaganda. He was greatly impressed by a statement in one of the pamphlets that of seven million houses within reach of electricity supply only 1,400,000 were wired. The experience of other industries proved that such a position could be greatly changed. A very few years ago it was found that the consumption of milk per head in this country was much below that of many other countries. The milk supply industry entered upon an intensive co-operative publicity campaign, with the result that the sales of milk rose to a remarkable extent. Another example was presented by the gas industry, which, by means of co-operative propaganda, had made immense strides in spite of electrical competition. The Indian tea industry had also benefited by that form of co-operation; it had even extended its Indian market. Direct advertising by individuals aimed at getting somebody else's customers; the most fruitful advertising was that which sought to create *additional* customers. The experiences of such dissimilar industries as milk, gas, and tea were striking evidence of the success of that method. All commerce consisted of the exchange of goods. Whatever mistakes were made by statesmen or business men, man would continue to progress, and the exchange of commodities would continue to expand. Although that growth was inevitable it could be quickened by co-operative publicity, and no efforts in that direction would be wasted.

Sir Henry Fowler, K.B.E. (President of the Institution of Mechanical Engineers), proposed the toast of "The Public Service of Electricity." Public service, he said, was the highest ideal of a community or an individual. Electricity was rendering the greatest public service by giving the people light, heat, and power. It would, however, perform far greater services, if it were cheapened. He hoped that the mass production of electricity would lower its price to enable it to go ahead at a greater rate. Coupling with the toast the names of Ald. W. Walker and Mr. W. B. Woodhouse, he said that the former had done good work for Manchester, and was to do more for the community at large as a member of the Central Electricity Board; Mr. Woodhouse had performed great service to the supply industry and the Institution of Electrical Engineers.

In responding to the toast, Ald. Walker said that during the past year, when industry was in a very bad state, electricity had continued to advance. That was due to the growth of the domestic demand, the credit for which was due to E.D.A. For years the electricity supply undertakings had attempted to develop a domestic load individually, but with small success. Now electricity had become a fashion, and that would stimulate the industry in a remarkable manner. Electricity now entered into every minute of the life of the community and the individual; it had even become the nation's principal medium of entertainment. The Association was continually opening up business in new directions, and it did so very cheaply. Referring to the cost of electricity, the speaker said that high prices were generally the result of difficult conditions which the Electricity Act should help to remove. He had no doubt that the Act would eventually lead to a lower average price. In conclusion, he urged electricity supply authorities to set aside more of their profits for the work of E.D.A.—which would result in more profits.

Mr. Woodhouse (Yorkshire Electric Power Co.), who also replied, said that many present had seen the electricity supply industry proceed from poverty to prosperity. The fact that the industry had attracted the attention of all political bodies was a sufficient indication of its present importance. Such distinguished patronage was a compliment to their abilities—not the result of their backwardness. The industry should proceed with caution and commonsense, making sure that every step was a sound one. For that purpose they must depend upon themselves and not rely on political patrons. Rapid progress must leave room for individuality and differences of opinion. He appealed for a free hand for private enterprise. The inception of the industry was due to private enterprise, and in that connection he mentioned the splendid pioneer work of Dr. Ferranti. Through E.D.A. all parties could co-operate in developing the demand; all those in the industry must pursue the ideal of cheap electricity and public service, and they would reap a just reward. The Industrial Councils of the industry (for which Ald. Walker had done a great deal) had taught masters and men to pull together; the companies and the municipalities should profit by their example and co-operate for the public good.

Sir James Devonshire then proposed the toast "Our Guests," stating that such a banquet would be a dull affair without such distinguished guests. He congratulated Dr. Ferranti upon his coming election as a Fellow of the Royal Society, and considered that the Royal Society was to be congratulated as well. He expressed the pleasure of the company at the presence of so many members of the Electricity Board and representatives of the Electricity Commission. He was not yet quite sure of their respective positions. On one page of the new Act the Board was top dog, but on the next it was the bottom dog, and so on. He also referred to the presence of Col. R. E. Crompton and many representatives of municipal authorities.

Sir Andrew Duncan (Chairman of the Central Electricity Board) responded, and said he hoped that if the Board did not meet with the approval of all sections of the industry it would not be barred from their festivities, which appeared to be among the perquisites of the Board. Although the Bill had led to a great deal of controversy, he trusted that the Act would enjoy the hearty co-operation of the whole of the industry. He asked them to feel that the Board was no arbitrary or autocratic. It afforded an opportunity for co-operation, and the work of E.D.A. would supplement and assist the efforts of the Board.

The speeches were followed by an excellent concert provided by Miss Beryl Costello, Mr. Thorpe Bates, the Misses Jacqueline and Joan, Mr. Norman Long, Mr. Cyril Shields, and Mr. Victor Marmont.

The E.D.A. Annual Report.

We have received a copy of the Electrical Development Association's report for 1926, which was presented at the annual meeting last week. This contains a full list of electricity supply members, particulars of sub-committees, &c., as well as a review of the year's activities. Some space is devoted to details of the national campaign. The report is available to any electrical undertaking which cares to make application for it to the Association.

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

A Simple Junction Box.

We have received from Messrs. Sefton-Fiddian, Leage and Co., Bush Lane House, Bush Lane, Cannon Street, London, E.C.4, a sample of their patented "Bonfix" junction box which they have recently designed and introduced. It is intended primarily for use in bonding metal sheathed cables used on internal wiring work. It consists of two parts only, the base, which is the essential bonding element, and a suitable cover made to fit over projecting clips on the base, securing slots being provided. Stamped out from the base are four

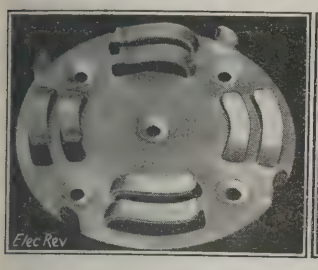

Fig. 1.—"Bonfix" Box Base.

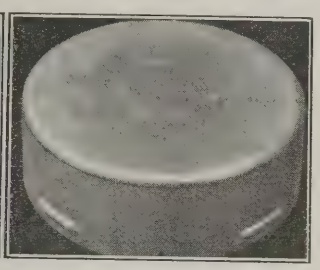

Fig. 2.—The Cover.

double spring clips which accommodate the ends of the cable sheath, and, it is claimed, effect efficient bonding. The base is of heavily tinned brass. The device should prove extremely simple to install, and no screws or other accessories to the box are required. Figs. 1 and 2 show respectively the base and the cover. It will be seen that adequate fixing can be obtained from five different points. The clips are designed to accommodate single, twin, or 3-core flat cables of conductor sizes up to 3/.036. Ample provision is made in the depth of the cover for the use of porcelain connectors. The box can be equally well used in connection with systems employing cabtire or other sheathed cables for their efficient mechanical security. Provision is made at the back of the base to keep it away from the wall, thereby ensuring against condensation troubles.

An Improved Electric Hair Dryer.

Although designed primarily for the treatment of hair, the new "Ideal" dryer, recently introduced by Messrs. Falk, Stadelmann & Co., Ltd., 83, Farringdon Road, London, E.C.1, is claimed to be suitable for being put to many other uses in the home, including, *e.g.*, therapeutic treatment and photography. The apparatus embodies four improvements, as a result of which distinct advances are claimed on the old models.

Fig. 3.—Driving Unit.

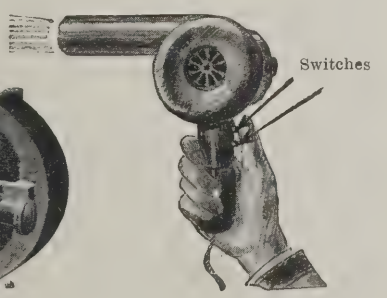

Fig. 4.—Ideal Hair Dryer.

The switches are fitted conveniently in the handle so that they can be manipulated by the thumb of the hand in which the machine is held, leaving the other hand free, fig. 4. The air vane is of a new design with six blades which increases the normal output by nearly 30 per cent. By means of an improved intake the atmospheric noises are greatly reduced. The driving unit, fig. 3, has been greatly simplified, aid is assembled without screws. The dryer is arranged for connection to any ordinary electric lamp holder, and hot or cold air is obtainable by the simple operation of a switch.

A Battery Maintenance Outfit.

A number of special repair outfits for use in connection with battery maintenance have been introduced. Among these is the "Segis" battery outfit, which has lately been put on the market by Messrs. S. Guiterman & Co., Ltd., 35-36, Aldermanbury, London, E.C. The output consists of a full-size hydrometer, a large celluloid funnel with an air vent, four large lead-coated battery clips, a large tin of anti-corrosive battery terminal grease, and an 8-oz. "Testrite" battery filler, all contained in a stout wood case with a hinged cover. The same firm is also handling the "Simplicit" acid pump, which has a conical plug for inserting in the neck of the usual acid carboy, and is operated after the fashion of a pipette scent spray, provision being made for regulating the flow or rate of discharge from the carboy into the battery as required. The whole is constructed of acid-proof materials and is designed to trap the drippings and prevent leakage and waste by overflow. The outfit includes 4 ft. of heavy overflow or delivery tube, and a nozzle end for inserting in the cell openings.

A Feed-Water Impurity Indicator.

The Crockatt Simplex Patent Electric Salinometer, fig. 5, has recently been produced by Messrs. W. Crockatt & Sons, Ltd., 62 and 64, Darnley Street, Glasgow, S.1, for the detection of salt or other impurities in boiler feed water. Its operation is based on the varying conductivity of dilute solutions of electrolytes according to the impurity content, provision being made for the conductivity variation due to changes in temperature. The instrument consists of three essential parts, the detector or electrode cell, the temperature compensator, and the indicating or recording instrument. The detector is

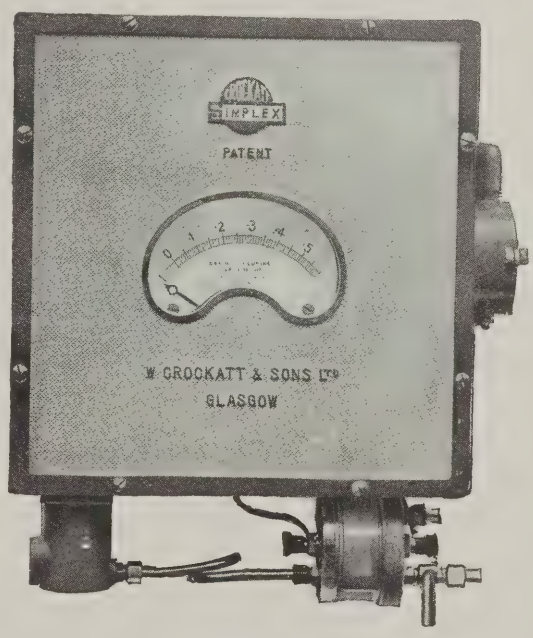

Fig. 5.—Indicating Instrument.

of glass, secured in a gunmetal case, and fitted with platinum electrodes specially designed for obtaining accurate readings. The temperature compensator comprises a gunmetal pocket, containing the thermometer bulb, through which the test water flows on its way to the detector; the rise or fall of the mercury operates a series of contacts which correct the instrument reading for changes of temperature. The indicating instrument, fig. 5, contained in a cast-iron case, is of the moving-coil type, and has a 6-in. dial. A ¼-in. bore copper pipe connects the water system and the thermometer pocket, and from this the water passes through the detector and then to waste or back into the feed system. A watertight switch on the right-hand side of the case provides for the necessary electrical connection.

The instrument is claimed to be extremely sensitive, the standard Admiralty type reading from 0 (pure water) to 0.5 grains of chlorine per gallon, with a temperature range of 80 deg. to 120 deg. Fah.; the usual commercial range is from 0 to 5 grains of salt per gallon. To meet the case where it is desired to take the readings from a number of points, the multi-point instrument has been designed. In this a number of detector cells are used in connection with one indicating instrument only, interlocking change-over switches being fitted so that any cell can be connected to the instrument, and a reading of the salinity taken. Indicating lamps are permanently in circuit to show the presence of salt.

The "Ideal Home" Exhibition.

A Review of the Electrical Features of this year's show at Olympia, London.

(*Concluded from page 455.*)

Standard Telephones & Cables, Ltd.

A very comprehensive range of domestic electrical exhibits is shown on this stand. One appliance which is commanding a great deal of interest is the "Standard" vacuum sweeper. An outstanding feature of this is the "Vac-Mop," an attachment which is specially designed for cleaning polished surfaces. It is arranged so that the cotton duster or mop can be removed at any time for cleaning and replaced. An important point about the sweeper is that all the appliances and tools can be fitted from the front of the machine. The motor is so arranged that there is very little vibration on the handle. The motor switch is in a convenient position on the handle, so that the forefinger of the right hand can manipulate it with ease. Another feature of the exhibit is the "Standard" washing machine. This is of the alternate rotary type, and the clothes are contained in a perforated zinc cylinder, which is put into action by a simple switch. The wringer has rubber-covered rollers, and is capable, it is claimed, of taking a full-sized blanket. The wringer and the clothes washer can be operated simultaneously. The "Standard" ironing machine, fig. 8, is interesting many of Olympia's visitors. A small switch on the right controls the roller and the ironing shoe. In order that the operator may use both hands for guiding the material, a knee switch is provided. An excellent range of domestic table appliances, including coffee percolators, tea infusers and toasters, is also shown.

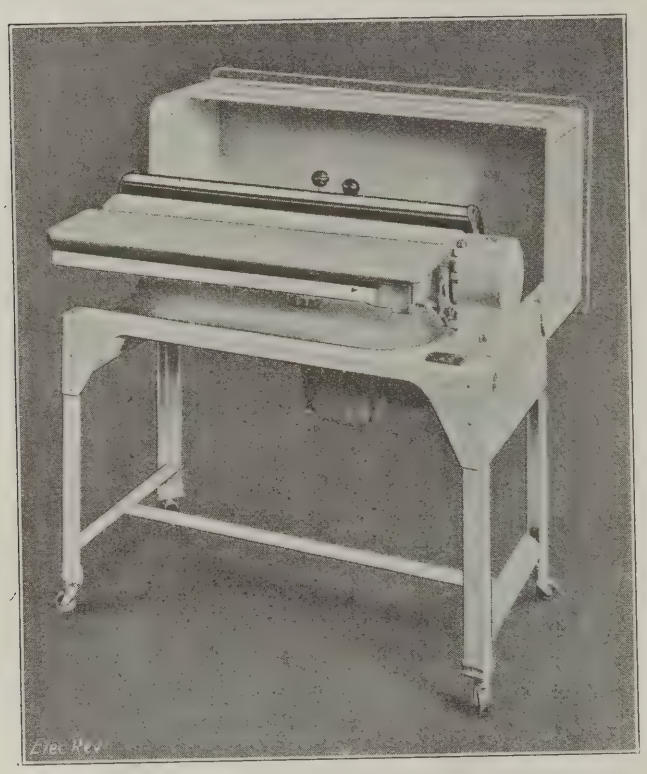

Fig. 8.—An Electric Ironing Machine.

General Electric Co., Ltd.

This company's stand accommodates probably the largest electrical exhibit in Olympia. It is arranged in two sections, one in full view of the visitors from the main floor, and the other comprising demonstrating rooms which are furnished properly so as to give the desired atmosphere for displaying the electrical apparatus. The general exhibit includes cookers, fires, hair dryers, kettles, suction cleaners, refrigerators, toasters, washers, wringers, and so on, all representing the latest developments of the company. The "Magnet" electric wizard (Electrical Review, February 11th, 1927, p. 211) is attracting a great deal of attention from the public, continuous demonstrations being given of its many uses. Another feature of the apparatus shown on this stand is the "Batchelor's" grill. This neat appliance will, it is claimed, perform most of the cooking requirements of one or two people as effectively as many of the larger types of electric cookers will do them for an average family. The demonstration portion of the exhibit includes a reproduction of a modern bathroom, completely equipped electrically to illustrate how the adoption of the electrical idea conduces to comfort, convenience, and hygiene in this important apartment of the home. Hot water is supplied, both to the bath and wash basin, from an electric calorifier, controlled by a thermostat. Over the wash basin is an electrically heated mirror, and conveniently placed beside this is a wall plug to which a small electric shaving pot may be connected. To add to the personal comfort of the occupier during shaving operations, a novel type of lighting unit over the mirror provides a good light without glare. The main lighting is provided by a central "Superlux" bowl. A towel rail and a bath-gown rail are both electrically heated by means of concealed immersion heaters. The equipment is completed by an electric hair dryer and an electric vibrator. In the company's reception room on the stand, which is designed to represent a modern dining-room, a feature is the artificial sunlighting effect from a full-size window, the exterior of which is equipped with "Osram" lamps. The interior lighting is effected by four specially mad inverted wood corner brackets fixed at about a third of th way down the wall, and the result is very pleasing. An all electric kitchen accommodates the usual G.E.C. apparatus fo cooking, washing, cold-storage, and so on.

Fig. 9.—G.E.C. Stand at Olympia.

Dignity is given to the general exhibit by the inclusio of two imposing life-size figures in bronze of a Frank and Saxon—the original Vikings—which were cast many year ago for the Royal Opera House, Paris. Fig. 9 shows thes figures; the lamps are, of course, electrical. A point wort mentioning is the roof of the stand, where from the gallery on sees a huge map of Great Britain bordered by the company trade mark and the words, "The home of quality produ tion" and "Buy goods made in Great Britain."

British Thomson-Houston Co., Ltd.

A very effective and spectacular display is housed on th stand to popularise Mazda lamps. In the foreground, th familiar Mazda clock cut-out, reproduced to a very large scal is picked out by spotlights while the clock face itself is illun inated from behind. To the rear of this tableau a number cubicles representing rooms in the home, are equipp with appropriate B.T.-H. fittings for the purpose of demo strating under actual working conditions the many types a sizes of Mazda lamps, including the latest development—th Pearl Mazda.

Thorn & Hoddle, Ltd.

On this stand is shown a comprehensive range of sm electric generating plants, including the "Pelaphone" equi ment, in addition to a display of lighting fittings of the exhi tors' own manufacture.

Delco Light Co.

An interesting array of automatic electric lighting pla designed particularly for country houses, in addition to au matic electric pumps and Delco-Light battery sets, is to seen on this stand.

Telephone Development Association.

This exhibit is laid out to remind the visitor of the advantages of the telephone service. A very interesting feature of the display is the "Burovox" loud-speaking telephone system which has been installed at Scotland Yard and some important business houses and theatres in the country. The system consists of a small microphone, a number of loud speakers, and the necessary master switch, or, if required, the switch can be combined with a loud speaker as one unit. The loud speakers can be hung up in the required compartments or rooms, or they may be obtained in table-stand form. In connection with this exhibit the Association is running a competition. Each visitor to the stand is given a number, and the holder of a winning number drawn each day will be entitled to the first year's rental of a telephone, installed free at any private residence situated within 1½ miles from an existing exchange.

Frigidaire, Ltd.

At this stand may be seen a wide range of Frigidaire apparatus designed to meet the requirements of all commercial interests concerned with the production and preservation of foodstuffs. The equipment includes cabinets in varying models, and display counters, butchers' caterers, and so on.

Electrolux, Ltd.

Varying designs of the "Electrolux" refrigerator are shown at this exhibit, and also the actual refrigerating unit is displayed without its necessary housing or cabinet.

Other Exhibitors.

Among the other electrical exhibitors are Messrs. Freezone, Ltd., who are displaying their home refrigerator and hygienic larder; Hammond Bros. & Champness, Ltd., electric lifts; Duncan Watson & Co., "Apex" and "Rotarex" domestic electrical appliances; Clarkhills, Ltd., electric water heater; Spenser's Silverlite, electrically-driven gas generator; B.I. Syndicate, Ltd., "Astro" reflectors; Mechanical Refrigerator Co., Ltd., automatic electric refrigerators; Sheringham Daylight Co., Ltd., "Sheringham" synthetic daylight lamps; Ransomes, Sims & Jefferies, Ltd., electric lawn mower; British Home & Office Telephone Co., Ltd., intercommunication telephone system; Electric Appliances Co., Ltd., the "Eureka" electric cleaner; A. W. Gamage, Ltd., small electrical domestic appliances; British Vacuum Cleaner & Engineering Co., Ltd., electric vacuum sweepers; Hurley Machine Co., various electrical domestic appliances; Tellus Super Vacuum Cleaner, Ltd., the "Tellus" cleaner; Electrolux, Ltd., refrigerator; A. Delval, the "Laun-dry-ette" electric washing machine; Radio Vacuum Cleaners, Ltd., the "Vacuette"; Betax Mfg. Co., Ltd., small domestic apparatus; S. C. Johnson & Son, Ltd., electric floor polisher; Gen Labor-Saving Device Co., Ltd., the "Ohio" electric vacuum cleaner; and others.

We learn that the fountain court in the main hall, to which we referred in our issue of March 11th, was manufactured by Mr. G. W. Robinson, who also made the electrical fountain on the *Smallholder* stand in the new hall.

What is Electricity?

"When we read that 'In the beginning God created the heavens and the earth' we know, within the limits of human knowledge, that the first thing made was electricity;" protons and electrons are right and left-handed, having the nature of screws, and are suggested to be simply permanent loops on vortex threads of a vortex sponge ether; the vortices are possibly spiral.

By Prof. W. M. THORNTON, O.B.E., D.Sc., D.Eng., M.I.E.E.

(*Résumé of* Faraday Lecture *delivered before the* Institution of Electrical Engineers.)

RECENT research has shown that the atoms of the universe are spinning groups of electrical charges, minute planetary systems, each with a mass of positive charge as a nucleus about which electrons of negative charge revolve in orbits, each of which corresponds to a line in the atomic spectrum, visible or invisible.

With slight modifications, Newton's law of gravitation holds for farthest stellar systems of immense magnitude and for the smallest atoms: the telescope tells us that the vast interplanetary regions are empty of matter, which spaces find their counterpart in the hollow interior of the atom, swept clear of intruding electric charges by the outer electrons revolving in their orbits a hundred million million times a second; giving out light, under certain conditions, oscillating at the same high frequency. Light is an electrical phenomenon, visible electrical radiation, requiring an oscillation of electrical charge to produce it, and a receiver (the eye) to observe and record it. Since light of a kind identical with that we can make has been received from atomic vibrations in stars so far distant that it has taken a million years (travelling at a speed of 186,000 miles a second) to reach us, we can infer that the electricity in the most distant parts of the universe is the same as that of which our own world is made.

The Nature of Electricity.

Though the nature of electricity as a dual entity may be still unsolved, we know a good deal about it: it is not in the strict sense material, but a kind of sub-matter. Charges have in their electromagnetic behaviour directly opposite characters and for this reason only can they be said to be opposite in sign. There are nearly 25 billion electrons to the inch; protons are still smaller, but are 1.850 times heavier than electrons. When we ask for a pound of bread, or of butter, or tea, we really ask for a pound of electricity in the form of these commodities. There are known to be 92 possible atomic elements of matter, a few of which have still to be discovered; each of them normally contains equal numbers of positive and negative units of electricity. To account for this equality both must have been made simultaneously by the same act, a definite creation. The electricity in the universe is an incredibly vast store of energy: there is enough energy in one pound weight to raise a hundred million tons of cold water to boiling point, or to give 16,000 million horse-power for one hour. The proof of this statement is one of the most solid achievements of the theory of relativity.

Electricity must be made from the ether, there is nothing else to make it from; since in the formation of the charges work is done, and it can only be by compression, tension, or twist, it is necessary to find which was first used. The ether streams through the earth without resistance, the planets do not appear to be in the least affected by their motion through it: it is therefore impossible to apply force to it by ordinary matter, but it can be twisted by electricity in motion, for around every electric current there is a magnetic field, right-handed about a positive charge, left-handed about a negative charge. A magnetic field is a circulation in the ether resembling a fluid "vortex," and can be shown by discharge in a vacuum tube; spiral nebulæ are also evidence of vast spins, or twists, of the ether so large that in some of them the solar system would be lost.

Their electromagnetic behaviour is the strongest evidence that protons and electrons have the properties of screws, of opposite sign, right- and left-handed, respectively; when the motion stops the twist relaxes, the magnetic field ceases. The ether is fine grained, that is, has a structure, first suggested by Lord Kelvin to be that of a vortex sponge, a perfect tangle of extremely small hollow threads of the fluid ether spinning around their centre lines. This view has been supported by very strong evidence, by leading scientists, and it is now suggested that the screw forms of protons and electrons are simply permanent loops on vortex threads of such an ether; they are permanent, for the two sides of the loop are held together by their common circulation just as an electric loop is held together at the crossing point by its magnetic field.

How the Electricities Were Made.

If a great spin were given to a portion of such an ether, half of its spinning threads would be spun tighter, and the other half untwisted; but when a thread is twisted sufficiently a right- or left-handed loop forms, according to the relative

direction of the original spin of the filament and of the superposed twist. Such loops on a vortex thread are permanent, and have all the properties of the electric charges; when moved they produce circulation around their line of advance, in this way accounting for the magnetic field around a moving charge—since the loops are right- and left-handed, their magnetic fields are opposite in sign, but the loop twisted tighter is smaller than that opened out; therefore one electric charge is smaller than the other, and so the proton is smaller than the electron. The smaller offers more resistance to motion than the larger, for it is more difficult to get a fluid stream through a small orifice than a large one; thus the proton is much more difficult to move than the electron, being 1,850 times more massive.

The Electricities Combine to Form Matter.

There is evidence that the ether is not an incompressible fluid, and that its filaments are short and varying in section, though each in itself has the same circulation, for the protons and electrons all have the same electrical charge; that is, have the same strength, or associated movement, around their centre lines. Imagine these filaments continually joining up and breaking apart as they get too long for stability, in perfect confusion, each retaining its intrinsic energy of spin. No filament has a definite end, or beginning, but its motion is, as it were, trumpet-shaped at each end; when two filaments on which permanent loops have been formed approach, their ends, which have the same direction of circulation, coalesce, but the longer filament so formed is no longer unstable: the two parts when joined form an atom, or part of an atom. If there are only two, one of each, we have a hydrogen atom; the next highest, the helium atom, is much more complex, and the scale of complexity rises rapidly according to clearly-defined laws.

The ether itself is an insulator, that is, it contains no free isolated electric charges, but it transmits electric waves by the rocking motion communicated to its filaments by the oscillation of an electric charge in an atom, in which case the waves are short; or by electrical oscillations on conductors (forming, for example, the aerials of radio systems) when the waves may be miles long; in every case, X-rays, light, or radio, the mechanism and velocity of transmission are the same. A charge in its motion drags the adjacent filaments in contact with it around as it passes: they at once relax to their old position, but because their motion has magnetic energy, they overshoot and oscillate, handing on the motion to the next filaments at the speed of light. To have this high frequency the ether behaves, because of its intrinsic spinning motion, as a very rigid medium with an extremely high coefficient of elasticity.

Matter in Motion.

Electricity in motion produces magnetism. Since all matter is electricity and contains equal quantities of each kind, matter moved through space does not give rise to any external magnetic effect: the two kinds counteract one another, but when the motion takes place in a magnetic field, the resultant force on all the positive charges which form matter is in one direction, sideways to the motion; that on the negative charges is in the reverse direction, and the charges therefore separate a little and the body is said to be polarised. If it is an insulator, the polarisation is proportional to the velocity of movement; if a conductor, it is also proportional, but only one charge (the negative) can move. All the positive charge is anchored in the nuclei of atoms and cannot move bodily, but in metals and similar substances a great number of negative charges are free to move about like molecules in a stream, and when such a body is moved in a magnetic field there is a piling up of negative charge at one end of the conductor—resulting in what is called the open-circuit voltage. When the ends of the conductor are joined, a stream of (negative) electrons passes through the external circuit and back into the wire forming a completely closed path, the motion of the conductor through the magnetic field causing it to act as an electron pump, or dynamo. The work done in causing the electric charges to stream along in this way is not dissipated (or only a small portion of it) in the machine, but is handed on to the external circuit.

[The lecture, which has been delivered before crowded audiences in London and at eight local I.E.E. Centres, some of which were joint meetings with other societies, was illustrated with lantern slides and effective demonstrations.—Eds. Elec. Rev.]

Electric Lamps and Valves.

An indication of the nature of some of the problems encountered by manufacturers who seek a reduction of empiricism in process operations: efforts to solve them lead to fundamental questions which science has so far failed to answer.

(*Abstract of Lecture delivered before the* Royal Society of Arts.)

THE Hall of the Royal Society of Arts in John Street, Adelphi, has not often been more crowded than on the occasion of the lecture with demonstrations and experiments, given on Wednesday, February 16th, by Mr. C. C. Paterson, Director of the Research Laboratories of the General Electric Co., Ltd., at Wembley.

The first part of the lecture related to the change that has come about in the manufacture of incandescent lamps during the past decade, hand manipulation having largely given way to mass production; there is still much hand work in the manipulation of the filament, but the bulk of the processes is carried out automatically. Ten years ago the output of ordinary incandescent electric lamps during the final stages of manufacture was at the rate of three per operator per hour; to-day it frequently touches 25 per operator per hour. The total world consumption of lamps at the present day is about 600 millions per annum, of which this country manufactures and consumes about 30 millions. This might sound a small proportion, said Mr. Paterson, but in itself it was a large quantity, and one which would clearly be increased very greatly in the future.

The valve, thermionic or otherwise, was subject to the antagonistic efforts of those, on the one hand, who, for the sake of efficient production and standardisation, desired to limit the number of types to a minimum and, on the other hand, of those who found in the many possible variations of design an opportunity to obtain interesting results in combination with the many possible variations in wireless receiving circuits. Hence, where the production engineer could plan for the lamp in terms of hundreds of thousands of a type, he must, in the case of the valve, be content with tens of thousands. The resulting difference in efficiency of production was considerable, but at the present stage of development it was probably inevitable.

The paper briefly surveyed some of the materials involved in lamp and valve making, after which detailed consideration was given to the vacuum, the transmitting valve, and the filaments of both lamps and valves. With regard to the vacuum, the importance of removing the last traces of gas was stressed, it being explained that in gasfilled lamps, and before gas-filling took place, every possible trace of water vapour must be removed, because it acted in relation to the gasfilled lamp filament as cancer did in the animal body and caused alternate local growths and wastage. In ordinary transmitting valves, gas present caused wastage of the filament through bombardment by the gas molecules, and in dull-emitting transmitting and receiving valves, it poisoned the filament surface with a contaminating gas layer through which the electrons could not pass. The first step towards the removal of the last traces of gas was a thorough understanding of the nature, the origin, the quantity and behaviour of the residual gas, because it was the action of the residual gas with which they were most concerned: it was not possible to get rid of all the gas; some remained even in the highest vacuum.

Apart from minute accidental leaks, the gas which was liable to give trouble was that which came from the glass and from the metal electrodes. The glass gas consisted chiefly of water vapour and carbon dioxide in not very unequal proportions, whilst the metal gas was mainly carbon dioxide and hydrogen. In the practical evacuation of lamps there was not usually any trouble through the spoiling of the vacuum by gas from metal, because the total surface of metal was relatively small. It was therefore only necessary to consider seriously the glass gas. It would be easy to evacuate every lamp by long pumping with a good diffusion pump, simultaneously heating the glass, so as to leave it in as gas-free a condition as possible. That, however, would be far too slow and expensive a process and altogether unsuitable for economical mass production. Research workers had, therefore, studied the conditions for the holding of gas down on to glass surfaces with a view to using this phenomenon to the best advantage. The result of this work had been that the capacity of the surface for gas could be enhanced by the con-

densation on the glass of any vaporised solid material, such, for instance, as that of the filament metal itself, or of a coating of any suitable material the vapour of which would condense on the glass. In the case of lamps it was essential that that layer of condensed vapour should be transparent, and phosphorus vapour mixed with cryolite answered the requirements well, the amount of phosphorus used being just sufficient not to colour the bulb, usually coated on to the filament before the latter was mounted. It could also be sprayed on afterwards. After mounting, the bulb was evacuated to as low a pressure as possible by the vacuum pumps, under heat, and sealed off. On heating the filament the phosphorus was immediately vaporised and condensed on the inside walls of the bulb as red phosphorus. Simultaneously, a large number of the gas molecules adhered to the surface and were mixed up with the phosphorus layer. During the condition of violent ionisation existing during the operation, the molecules of red phosphorus on the surface of the layer were subjected to electronic bombardment which converted some of them to white phosphorus, which tended to vaporise again, and then to recondense as red phosphorus on the surface, burying more gas molecules in the layer and presenting always a fresh surface to which gas molecules could attach themselves. The major part of the process was all over in a second or so, but so long as there was any electronic bombardment of the surface it would continue. If, during the life of the lamp, gas tended to be freed, ionisation would increase and so would the process of "clean-up," so that every lamp had its own automatic safety device in the invisible phosphorus layer on the inside surface. This picture, said the lecturer, was simple, but it was to some extent speculative because certain factors were not yet clear. They did not know, for instance, what part was played by the ionisation of the gas molecules themselves. They did know, however, that ionisation was necessary for the "clean-up," although molecules did not go to the walls in an ionised condition.

In the case of thermionic valves of relatively small size, transparency of the deposited layer did not matter, and vaporised magnesium was generally used. This caused the well-known mirror-like appearance of the inside of the bulb of most wireless valves.

Discussing the difficulties encountered in the manufacture of large transmitting valves, and the danger of using large areas of glass which approached the temperature at which there was an apparently continuous evolution of gas from the glass, it was pointed out how the designer had the choice of doing away with glass altogether for large valves, or of restricting its use to those parts where electrical insulation was needed, but which could be kept at a low temperature. On account of its insulating properties, its non-permeability at normal temperature to gas, and its mouldability, glass (or its pure form, silica) was the best material available for that part of a valve where the electrodes were held and where current had to be led from outside the evacuated enclosure to the inside. Metal, however, said Mr. Paterson, was clearly the best material for those parts where great heat energy had to be dissipated and the only means of carrying it away was by water or another form of intensive cooling. Therefore, the water-cooled valve had been developed, the great step forward in connection with which—made originally in America—was the large glass-to-metal joint for connecting the glass ends to the metal centre. The glass-to-metal joint was an established item in the technique of this industry and might have considerable future applications. Such joints had been proved to withstand a pressure of 100 lb. and more at the centre.

The final part of the paper discussed in some detail the more or less well-known features, to engineers, of the manufacture of tungsten filaments, and related the work that had been done towards obtaining filaments of one long crystal instead of a large number of crystals. Here, again, speculation was involved in their knowledge of the crystal structure of filaments and their relation to the properties of the lamp filament after it had become incandescent. Experiments had indicated the nature and trend of research in this direction, but the large question of the ultimate strength of different types of filament and their relative ability to withstand the stresses to which they were liable to be subjected in use, had to be left for want of time. It was pointed out, however, that the properties required in tungsten filaments for valves were very different from those required for lamps. The extraordinary coincidence was noted that the very ingredient, thoria, which for years had been used by lamp makers to restrain grain growth in filaments, should be the one material above all others suitable for contributing an entirely different property, *i.e.*, that of emitting electrons. The "dull-emitting" property of tungsten filaments depended upon the maintenance of a molecular layer of thorium on the surface of the tungsten. This continually evaporated and was constantly replenished from the thoria contained, it was believed, mainly in the grain boundaries of the tungsten metal. This thorium layer facilitated the emission of electrons because one of its specific qualities was to offer a lower resistance to the passage of the electrons than an equivalent layer of tungsten molecules. The layer was readily contaminated by minute traces of oxygen containing gases and vapours, hence the importance of a high vacuum and an agency always at hand to deal chemically with the objectionable molecules. So far, however, as the metallurgy of the filament was concerned, the object was to secure such a grain structure as would afford rapid and plentiful diffusion of thorium to the surface of the metal. The difficulties of the technique and study of this work, continued Mr. Paterson, must be borne in mind; many of the filaments under consideration were of the order of only 0.02 mm. diameter, a size which had the same relation to an ordinary sewing needle as the diameter of the needle had to the wrist of the person using it.

The paper was an attempt to indicate the nature of some of the problems which were forced upon the manufacturer who sought to reduce the amount of empiricism in his processes. The efforts to do so had led very quickly to fundamental questions to which science had not yet given an answer, or, at best, only a partial one. An effort was being made to force the pace in these fields of study for which, in certain ways, the technique of the lamp maker, when used in the laboratory, had unique advantages.

During the course of the lecture a series of interesting experiments and demonstrations was carried out. Among the exhibits was a large incandescent lamp made with the object of seeing to what extent size could go. It was a 10-kW lamp giving 25,000 c.p., and when lighting it Mr. Paterson warned the audience not to look directly at it. Another lamp was shown to illustrate the type of incandescent lamp now used in lighthouses. This was a 3-kW lamp, whilst for comparison there was a 100-volt gasfilled lamp. There was also exhibited a specimen of the large water-cooled valves which are now used at Rugby, Daventry, and elsewhere for wireless transmission, as well as an extra-high-voltage rectifier for 150,000 volts. A 50-lb. weight was hung upon a metal-to-glass joint, referred to in the paper, and the joint held easily. Dr. Smithells, one of Mr. Paterson's colleagues, then put the joint on two chocks and put all his weight upon it without breaking it. Other experiments were in relation to the heating effects upon filaments.

Sir Oliver Lodge, proposing a hearty vote of thanks to Mr. Paterson, recalled the exhibition in this country of the first electric lamp by Swan, who, at the time, had said he thought it would make a real lamp in time. It seemed incredible that the advances shown by Mr. Paterson to have taken place since that time should have happened within his (Sir Oliver's) lifetime. Those who had been accustomed to work in university laboratories must have felt green with jealousy when they realised the opportunities, the staffs of brilliant workers, and the money available in connection with the research laboratories of our great manufacturing companies. He congratulated the General Electric Co., Ltd., on possessing the services of Mr. Paterson and his assistants, and Mr. Paterson on the General Electric Co., because it was only possible to go ahead at the tremendous rate Mr. Paterson had shown was feasible when one had commerce at one's back.

Correspondence.

Correspondents should forward their communications **as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

A Handicap to Electrical Progress.

In your issue of to-day's date I notice a letter headed "Handicap to Electrical Progress." In the letter Mr. I. Fawcett states that there is only one conclusion to be arrived at from the fact that gas consumers in Leicester have to pay a lower deposit than electricity consumers, but I think that there is another logical conclusion, namely, that a consumer, having been accustomed only to gas supply, realises the cleanliness and convenience of electricity for lighting, heating, and cooking purposes, and as a consequence the consumption naturally increases.

This, of course, leaves out the question of the reduction in the doctors' bills due to the reduced poisonous content of the atmosphere, and possibly in the near future a reduction in life insurance premiums, due to the longer possible duration of life, apart from any tragic suddenness, of which we see so many instances in the newspapers day by day.

Anticipating a larger consumption, the Council will naturally ask for an increased deposit.

T. A. Kerr.

Electricity Works, Trafford Park.

The Wireless Receiver as a Load.

It is indeed remarkable that in a booklet published by the Association which is trying to increase the uses of electricity, no mention whatever should be made of the wireless receiver, although there is, as the newspapers have long realised, no better headline than "Broadcasting," and there is no electrical apparatus in the house either costing so much, or used so regularly, as the wireless receiver. Why, then, is it so generally ignored by the supply authorities, when it is actually a most useful potential load?

At present, in 99 cases out of 100, the accumulators are charged at a centre with power, probably at the power rate, making a profit for the contractor and using the supply at the time which least suits the station.

In the hundredth case the user charges his own battery—at the lighting rate—for one or a couple of nights per week. It costs him less, his battery lives twice as long, and it is a useful load to the station, apart from the extra life of the carpets!

As a manufacturer who has over 50 receivers running off the mains, I can state quite definitely that with an apparatus costing not more than £5 fitted, any wireless receiver can be run off the mains at a total cost of 1½d. to 2d. per day to the consumer, including h.p. and l.p. (which compares very favourably with the cost of batteries; at the same time it will increase the station revenue by about 1d. per day.

This is, of course, the d.c. figure. The a.c. first cost is higher, but the running figures are the same, or slightly less.

Actual experience of many receivers working off the mains shows that accumulator charging costs are halved as a minimum, accumulators last 2½ years or more as against less than 12 months when charged outside, and, the greatest saving to the user, valves last very much longer.

Apart from this, there is a constant and ample supply of h.p. and no battery crackling.

Surely one penny per day per receiver (as a night load only) is useful to "the chiefs."

Ernest J. Baty.

Luton, *March 18th*, 1927.

The Salaries of Engineers.

Those who have written on the above subject in your columns in the previous two or three issues, are quite right in the severe blame handed out to the Institution of Electrical Engineers. The National Union of Scientific Workers, which was mentioned by your first correspondent, is equally guilty of neglecting to attach due importance to the financial interests of its members. I suggest that both these institutions would greatly increase their usefulness by appointing committees of young engineers to investigate the whole matter of remuneration. The older and more influential members, being permanently in receipt of comfortable salaries, devote themselves to academic interests, neglecting even to study the financial positions of their own employés.

Although I agree to this extent with previous correspondents, I must say that engineers themselves are somewhat to blame in submitting to the treatment meted out to them. They have a very justifiable grouse, but are too lethargic to take steps to get it rectified. That lethargy, however, does not extend to their sphere of labours, for no body of men is more efficient or conscientious.

A great share of blame, however, lies on the employers. They wilfully pay their technical staffs immorally low salaries, knowing full well that this class of employé, at present, has no means of obtaining redress. Some time ago, I saw the statement by a competent authority that the adult human being had a capital value of £12,000. On a basis of 50 years' purchase, without interest, this amounts to £240 per year. This figure should be a *basis* salary for every decently educated person in the country, adjustments being made for the nature of the work being done by the individual, and for the size of his family. This view is not merely a Utopian one, but is sound business, and on some such lines the solution will eventually be found.

Yet Another.

March 14th, 1927.

Your "Poor Blighter" letters should possess an important interest for those who are in a position to deal with the matter at issue.

There is no doubt that the question of engineers' salaries is very largely wrapped up with the question of "supply and demand." This is, it would seem, quite a wrong basis on which to settle the salary question, even as it is wrong to immediately increase the price of a commodity because there is a temporary shortage of that commodity.

Whilst this basis is retained, and the works and colleges are turning out annually an ever-increasing number of young men who have in their studies attained a high standard of engineering knowledge, it would seem that some scale providing a suitable minimum salary should be enforced upon those employers who, under the present wage or salary system, are acting much in the same way as did the "war profiteers" throughout the great "European Upheaval," all of which simply points to a degradation terrible to contemplate, and of which modern industrial history gives too many examples.

As evidence of the deplorable condition of the labour market so far as concerns skilled technical work, may I cite a recent instance which came to my knowledge, of a vacancy for a junior in a small generating station. Among the 72 applications for this unimportant post were, I understand, the following:—Two B.Sc.'s (Eng.), one Whitworth exhibitioner, one qualified for Assoc. Membership of the Civils, and seven A.M.I.E.E.'s. Among the remainder, most of whom were reasonably worthy applicants, were two with 1st Class B.O.T. marine engineer certificates. The wage for this job was 40s. per week—the job was waiting for a youth.

This is a pointer, and indicates to my mind a rather sad state of affairs, and much would seem to be necessary of achievement, so far as the electrical industry is concerned, before these mostly unemployed qualified men are found their proper work in the world.

The general opinion is, I am afraid, that matters are becoming worse year by year, and who can wonder at it when one reads in the newspaper of a prominent electrical engineer consultant, and M.I.E.E. (till a few years ago, a monument of enterprise in the electricity supply business) engaging himself (probably for a suitable fee, for most consultants, I am told, have the money sense reasonably developed) to the National Gas Council, for the express purpose of opposing a municipal application for a Provisional Electricity Order.

One reads also of electrical consultants who specialise their efforts among the gas concerns throughout the country, some of which have, more or less successfully, been persuaded to take up the supply of electricity.

It may be urged in the wider interests that in some localities no alternative existed, but in an equally large number of cases it would appear that in the long run, such combination of interests (*i.e.*, gas and electricity supplied by the same authority from the same roof, under one management) does not favour the electrical industry, especially where, as in the majority of cases, the gas manager suddenly has to apply himself to the study of elementary electrical engineering, as a result of his being appointed "electrical and gas engineer."

Something has to be done, and the sooner the question of engineers' salaries (I refer to those outside the membership of the E.P.E.A.) is faced in a reasonable way, the better and more enthusiastic will service be rendered, and the produce of that service increased.

Here then, perhaps, the I.E.E. may find food for thought, for anything that is inimical to the interests of the electrical industry and the proper status of those engaged within it should arouse their attention, and bring forth their corrective and helpful influence.

P. W.

March 7th, 1927.

Your numerous correspondents on the above subject seem to miss the most important aspect of the question, namely, the fundamental economic law of supply and demand. As long as our technical institutions are allowed to turn out trained engineers in hundreds per annum irrespective of the state of the labour market, there will always be a considerable surplus for employers to draw upon, with the consequent deplorable remuneration of those who are already employed.

Some method similar to that adopted by America, of allowing only a certain quota of immigrants to enter each year, appears to be necessary to the engineering profession if the status of engineers is to be raised.

One of your correspondents, speaking for the Society of Technical Engineers, hopes to attain this desirable state of affairs by registering engineers by act of Parliament, so that by some mysterious means the salaries of engineers would rise automatically. He draws the analogy of the British Medical Association; but the latter is more or less a homogeneous body with a common object, whereas a registered body of engineers would consist of both employers and employés whose aims would cancel one another.

It is, of course, no simple matter to restrict the production of engineers now that matters have reached the present deplorable state, but one can always attempt to persuade parents seeking a career for their sons to place them where they are much more likely to lead a civilised existence.

They might do worse, for example, than apprentice them to a grocer, fishmonger, or publican. There is always the prospect of a seat on the local Council or in the House of Commons, and with their lack of knowledge of the elements of electricity they may even attain a position on the Central Electricity Board.

M.Sc.

Faults in Flexibles.

In calling attention to the above matter you are doing good service.

In my experience too little care is *taken* in the selection of a suitable flexible cord, particularly for portable electrical appliances and pear switches.

The danger with a faulty cord is not a short circuit, as the circuit fuse usually takes care of that; what usually happens is the following:—Owing to insufficient mechanical strength, the strands gradually break until continuity is maintained by a few wires only, which heat up; arcing occurs as the strands intermittently make contact, causing the rubber and/or the textile covering to smoulder, and if not promptly checked a fire may result.

In order to overcome these risks my firm introduced, a few years ago, a flexible cord named "Feraflex," incorporating with the copper wires several fine steel wires; over the insulation of these strands is woven a fine asbestos yarn which would effectively stifle any tendency to spark or flame; the conductors are twisted together, and to prevent kinking are braided over the twist with polished cotton or silk. This cord, used with electric irons, table lamps, vacuum cleaners, and other portable appliances, has been very successful; it is neat in appearance and unobtrusive.

Unfortunately, with the craze for cheapness, the flexible cord largely used is the cheap foreign make with a thin film of rubber, which constitutes a positive danger.

For pendant lights the 20-mil pure rubber insulation flexible with conductors of not less than 23/36 will be found safest.

The so-called "workshop flexible," with the conductors under a compounded braiding, is not, in my opinion, a desirable or safe cord to use.

London Manager, Ward & Goldstone, Ltd.

London, *March 15th,* 1927.

Electric Cookers in Housing Schemes.

I am anxious to obtain information upon the following subjects with reference to the installation of electric cookers in houses erected by the local councils:—

(1) Have they proved satisfactory?
(2) Under what conditions are they fixed—such as initial charges and price per unit?
(3) Are the consumers satisfied as regards the cost of installation and also the price per unit?
(4) Type of stove used?

Thanking you and your readers in anticipation.

H. A. Woods.

London, *March 16th,* 1927.

Parliamentary News.

[By Our Special Parliamentary Correspondent.]

Private Bills.

The Farnham Gas and Electricity Bill has been read a third time in the House of Commons, and the North Metropolitan Electric Power Supply Bill has been read a second time.

Rugby Wireless Station.

On March 14th, Viscount Wolmer, Assistant Postmaster-General, informed Sir F. Wise that the cost of the Rugby wireless station, including the site, buildings and plant, was about £480,000.

Broadcasting.

On March 15th, in reply to questions by Sir H. Brittain, the Postmaster-General said that the rule governing the use of wireless receiving sets in hospitals was that a single licence covered the installation of any number of receiving sets for general use in the main building; but separate licences were necessary for sets installed in other buildings, for example, in the private residential quarters of members of the staff. He was always prepared to give consideration to any case in which a strict application of the rule appeared to work harshly.

Asked by Sir H. Brittain how many cars were made use of throughout the country for the detection of the source of oscillation caused by wireless sets, Sir W. Mitchell-Thomson said that one car was in use at present. A second car was on order.

Viscount Wolmer informed Mr. Day that five persons had been prosecuted for using wireless transmitting apparatus without a licence. A conviction was obtained in each case, and the penalties ranged from a fine of £4 to a fine of £10, in addition to £5 costs. In two of the cases the apparatus was confiscated.

Ultra-Violet Ray Treatment.

On March 17th, Mr. Day asked the Minister of Health whether his notice had been drawn to the refusal of the Public Control Committee of the London County Council to amend its massage licence to include ultra-violet ray treatment under medical supervision, on account of the potential danger to the amateur and inexpert; and whether he would consider the introduction of legislation to restrict the sale or use of such apparatus to persons with medical experience only.

Mr. Chamberlain said he had no information as to the fact stated in the first part of the question, and he was not aware of any necessity for legislation of the kind suggested.

The Hastings Electricity Order.

Application was made to the Special Orders Committee of the House of Lords on March 15th, by the Hastings and St. Leonards Gas Co. for a further inquiry into the Hastings Electricity (Extension) Special Order, 1927, to consider a claim for the insertion of a clause affording protection to ratepayers against any loss which might be incurred by the Corporation in the supply of electricity in the extended area.

For the Gas Co. it was stated that the Order proposed to extend the area of the Corporation for the supply of electricity to include the borough of Rye, the urban district of Battle, the rural districts of Hastings, Rye and Battle, and the parish of Ninfield, in the rural district of Hailsham. The Gas Co. supplied gas in the borough of Hastings and various outlying places, including some of the parishes and places comprising the added area for the supply of electricity by the Corporation, and it was also one of the largest ratepayers in the borough. It alleged that its property, rights and interests would be injuriously affected by the Order. During the proceedings on a 1924 Bill the Corporation had stated that its electricity undertaking was working at a profit, and at that time it was affording a supply in bulk to Bexhill from a new power station. The price of that supply was an uneconomic one. It was admitted at a local inquiry held in 1925 that at the time of the promotion of the 1924 Bill the Corporation had in mind the extension of area now proposed. It appeared at that inquiry that the scheme of the Corporation would not be self-supporting; it was admitted by the Corporation that there would be a loss during the first few years. The Gas Co. pointed out that quite apart from any question of loss in relation to the proposed extension of area, there was a deficiency at present of some £23,000 on the working of the existing electricity undertaking. It was admitted at the inquiry that within five years the capacity of the existing generating station would only be sufficient to meet the needs of Hastings coupled with the supply to Bexhill, even if there were no added area. Therefore, with the added area, further capital expenditure on that generating station would be necessary at an early date.

A statement submitted to the Committee on behalf of the Hastings Corporation said that when the Corporation applied for the Order the Gas Co. had lodged objections, and the Electricity Commissioners had caused a local inquiry to be held. After full consideration the Commissioners had determined to grant the Order without the insertion of the protective clause now asked for. The Order was submitted to the Minister of Transport for confirmation, and after an inquiry had been held into the memorial of the Gas Co., the Minister had confirmed the Order without the insertion of the clause. Committees of both the House of Lords and the House of Commons had refused to insert the clause in the Corporation's 1924 Bill. The Corporation was convinced that within a comparatively short time the scheme would not only be self-supporting, but would be a profitable undertaking. The Corporation's figures had been accepted, both by the Electricity Commissioners and the Minister of Transport.

The total amount received from the rates by the electricity undertaking was £35,232, all of which was received earlier than 1920. Since April 1st, 1921, the undertaking had transferred in aid of rates £12,140, leaving a net deficiency of £23,092. As against this deficiency there must in fairness be set off the reserve fund of the undertaking, which at March 31st, 1926, totalled £25,904, and at the same date there was an unappropriated profit to the credit of the undertaking of £6,731. Certain ratepayers who appeared at the original local inquiry in addition to the Gas Co. had not pursued their opposition either before the Minister of Transport or Parliament. Finally, the Corporation submitted that the petition disclosed no substantial grounds for complaint; and that the subject matter of the Order had been so dealt with in departmental inquiries that further inquiry was unnecessary.

The Committee decided that further inquiry was not necessary.

Legal.

Southern Counties Electric Light and Power Supply, Ltd.

Mr. Justice Romer, in the Companies' Winding-up Court, on March 15th, had before him the petition of Mr. Percy Green, of Leamington Spa, a judgment creditor, for an order for the compulsory liquidation of the Southern Counties Electric Light and Power Supply, Ltd.

Counsel for the petitioner said he was substituted for a previous petitioner last week, and the petition had had to be amended and filed, but the affidavit verifying that had not yet been sworn. He therefore asked for the petition to be adjourned for a week.

Mr. Bischoff said he appeared for the original petitioner. He was paid a cheque for the amount of his debt and costs, and the petition was adjourned to see if the cheque would be cleared. The cheque had been cleared, but it was not accepted as payment, although the money was in hand pending the result of the petition. If an order was made it would be returned as having been paid since the commencement of the winding-up.

Mr. Hecksher said he represented a judgment creditor who was in the same position, and he was also holding the proceeds of a cheque which he had received until a decision on the petition had been given.

His Lordship adjourned the petition for a week.

Theft of Electricity.

At the Castle Eden (Durham) Police Court, on March 19th, John G. Cutter, a Minor of Thornley, was prosecuted at the instance of the Weardale Coal Company for the theft of electricity, the property of the company. It was stated that the company supplied electricity to the defendant's house, and upon inspection it was found that the meter had been short-circuited, rendering it ineffective. The company believed that this state of affairs had lasted for some time. A fine of 40s. was imposed.

Reviews.

The New Electricity Act. By W. S. Kennedy, LL.B. Pp. 142. London: Ernest Benn, Ltd. Price 6s. net.

The author of "The Electricity (Supply) Act, 1919," has lost no time in preparing a similar "popular exposition" of the new measure from which so much is expected. His explanatory analysis of the Act, published in our issues of January 14th and 21st, was necessarily restricted to its leading features: in this book he has endeavoured to translate the cumbrous phraseology of the Act into more comprehensible and readable English, and to explain briefly what the Act means to the man in the street. He does not, however, profess to give a detailed exposition of the Act, nor does he comment on its working. The book deals with the Act under seven divisions, taking the sections in order, with separate *résumés* of the provisions relating to arbitration, and the relations between the Board and the Electricity Commissioners, which, in some respects, are "rather anomalous." The remainder of the volume (60 pp.) is occupied with the complete text of the Act, and the index.

The Electricity (Supply) Act, 1926. By T. J. Sophian. Pp. vi+62. London: Sweet & Maxwell, Ltd. Price 4s. 6d. net.

This is a publication in separate form of an extract from Chitty's Annual Statutes, 1926, and is intended for the guidance of those who have occasion to study or refer to the Act. It consists in the main of a reprint of the Act, with a subject index, and numerous footnotes referring to previous Acts, cross-references to sections of the 1926 Act itself, excerpts from Acts partly repealed or modified, and explanatory comments. A prefatory note contains the memorandum presented to Parliament on the introduction of the Electricity (Supply) Bill, explaining its objects and origin.

The Electricity (Supply) Act, 1926. By E. J. Rimmer, B.Sc., M.Eng., and G. Read Allen, M.C. Pp. v+206. London: Solicitors' Law Stationery Society, Ltd. Price 12s. 6d. net.

This volume contains a table of statutes relating, however remotely, to electricity supply, with references to the pages on which they are cited, an introduction briefly reviewing the Electric Lighting Acts as a whole, with extended reference to those of 1919 and 1922, and a summary of the main provisions of the Act of 1926, which occupies 45 pages. A useful table shows the sanctions which the Board must obtain before it can exercise certain of its powers; this occupies three pages. It is pointed out that the powers and duties of the Electricity Commissioners have been extended, not diminished, by the new Act; their control in technical matters remains complete, many of the powers of the Minister of Transport have been delegated to them, and their authority has been strengthened; the changes in their powers and duties are set out in five pages. All the provisions of the Act relating to prices, charges, and valuation have been brought together under one heading.

There follows a complete reprint of the Act of 1926, with explanatory notes, cross references, references to other Acts, and comments. An appendix gives the text of the Electricity (Supply) Acts of 1919 and 1922, and a full subject index occupies 18 pages. Both of the authors are engineers as well as barristers-at-law, and have given attention to the engineering as well as the legal aspects of the Act.

The Electricity (Supply) Act, 1926. By J. C. Dalton, A.M.I.E.E. Pp. xviii+152. London: Butterworth & Co. Price 10s. 6d. net.

This is a supplement to "Will's Electric Lighting," 5th edition, and to those who are familiar with that invaluable work no more need be said. It is self-contained, as far as possible, but cross references to the parent book are given. A table of Statutes occupies seven pages, and a table of Cases is given. The history of the Act of 1926 is briefly outlined, and the Weir Report is summarised; the author then devotes separate chapters to the Central Electricity Board, schemes, the position of undertakers and others in relation to the Board, other provisions of the Act, and the consumer, after which the text of the Act, fully annotated with critical and explanatory comments and references, occupies 94 pages. A very complete subject index is provided. The contents of this book bear evidence of an exhaustive study of the Act and of its relation to previous Acts and existing conditions, involving untiring industry and a profound knowledge of the law of electricity supply. It is a worthy supplement to "Will's Electric Lighting"—and that, perhaps, is as high a compliment as the author and publishers could wish for.

Polyphase Induction Motors. By R. D. Archibald, D.Sc., M.I.E.E. Pp. vii+88; figs. 46. London: Chapman and Hall, Ltd. Price, 5s. net.

The growing importance of the induction motor amply justifies the appearance of a small work for the use of those who, without wishing to take up the problem of the design of this machine, are desirous of obtaining a sound knowledge of the principles of its construction and of its operating characteristics. Dr. Archibald's little book is evidently intended for such readers, it is generally non-mathematical in character, and will teach those interested in the elements of the induction motor, most of what they ought to know. It is difficult, in the limited compass which the author has allowed himself, to make a judicious selection of the many aspects of the whole subject which are of general interest. It is possible to criticise the selection which has been made, on the ground that to the majority of operating engineers a fuller discussion of the subjects of speed control and methods of starting would have been of greater interest than a detailed treatment of the conditions existing in the magnetic circuit of the machine. The general structure of the book is such that it is perhaps more useful as an introduction to a more complete study of the induction motor, than as a handbook for the use of the general electrical engineering reader.

The first chapter of the book is devoted to an elementary explanation of the principles of the operation of the polyphase machine, the production of a rotating field, and general details of construction. Chapter II deals with the circle diagram in its approximate form, its derivation, application, and construction from the results of open- and short-circuit tests. The author then proceeds to considerations of the distribution of the magnetic flux, the meaning of dispersion co-efficient, its approximate calculation from design data, and from the circle diagram. A chapter then follows, which gives detailed calculations relating to an actual machine, which serve to illustrate the foregoing work. The final chapter deals with operating characteristics, methods of starting, and speed control, the treatment of the last subject being rather sketchy. More space might well have been devoted to the discussion of the speed-torque characteristic; an investigation of the simple equation connecting these two quantities is very instructive.

There are a number of examples for solution at the end of the book, with answers, and also an index. The work will be found useful for those intending to proceed to a more extended study of the induction motor.

Makers of Science: Electricity and Magnetism. By D. M. Turner, M.A., B.Sc. Pp. xv+184; figs. 65. Oxford University Press. London: Humphrey Milford. Price, 7s. 6d. net.

This small volume is not confined exclusively to biographical sketches of the great outstanding personalities who have left their impress on the development of electrical science, but gives, in addition, brief outlines of the principal contributions which they have made to this development. Beginning, really, with Petrus Peregrinus in the thirteenth century, the author deals in chronological order with the work of Gilbert, of Colchester, and that of each of his successors who have carried the torch of science up to our own times. It is a fascinating record, and one which will bear reading over and over again because of the personal and human element with which the author has invested it. It would seem invidious almost to select one or more of those, whose work is dealt with here, for illustrative purposes; but the manner in which the contributions to science by Faraday and Maxwell have been treated is all that one could expect within the limits to which the author has restricted himself.

The field covered includes electrostatics, the electric current, electromagnetism, electromagnetic induction, the development of electrical theory, electrolysis, the conduction of electricity through gases, and the electrical constitution of matter. In the last chapter we are brought right up to the work of J. J. Thomson, Bragg, and Moseley, on the connection between electricity and matter; but, in the words of the author, "if we ask 'what is electricity' we are left with an unanswered question." It is somewhat surprising to find, however, no reference to the work of Eddington or of Jeans in the sphere of astrophysics, and the bearing that such work is having on our knowledge of the constitution of matter and of its relation to radiation, but probably it is of too recent a date to admit of its incorporation in the book.

An introductory chapter on the need for a History of Science is furnished by Dr. Charles Singer. There are 65 illustrations throughout the text, including a number of portraits; that of Faraday is particularly good. We heartily recommend the book as one which will be appreciated by the layman as well as the student of science.

Rotary and Motor Convertors. By E. F. Smith. Pp. xii+233; figs. 57. London: Crosby, Lockwood & Son. 1926. Price, 7s. 6d. net.

The scope of this book is considerably wider than is indicated by the title, the author having written it for the information of operators and attendants, who have had no educational grounding in the elements of electrical technology. The work therefore contains an outline, in simple non-mathematical language, of the principles of direct-current generators and motors, of alternating currents, the effects of inductance and capacity, and of the principles of the a.c. generator. Mr. Smith has set himself a difficult task, in endeavouring to cover this ground as an introduction to the main subject, especially as he has deprived himself of the assistance of elementary algebraic symbolism. It is difficult to say how far

the previously uninstructed reader will benefit by a study of this preliminary matter. It is generally very clearly written, and little has been omitted which is of real importance. Those who are not averse to some hard thinking, will probably succeed in obtaining a working knowledge of the basic principles, which will enable them to understand very fairly, the operating characteristics of the rotary convertor. We think, however, that most of those who have been able to follow the author's explanation of vector diagrams, would have been able to understand the derivation of the numerical voltage relationships in 2, 3, and 6-phase circuits. These should have been proved, and the numbers $\sqrt{2}$, $\sqrt{3}$, and so forth, used instead of 1.73 and 1.41. It is stated on p. 95, that in paralleling a polyphase generator it is necessary to synchronise on one phase only, the author should have pointed out that, although this applied to normal operation, the phase rotation must be checked when the machine is paralleled for the first time.

Turning to the treatment of the subject matter of the book, we find that this is dealt with in a very clear and practical fashion. After considering the basic principles of the rotary convertor, the author proceeds to describe the usual methods of voltage control. A little fuller treatment of the reactance method might have been given. The variation of power factor necessary in normal working, depends not only on the normal variation of the voltage required, but also on the value of the series reactance; this is not made sufficiently clear on p. 127. Methods of starting are very fully considered, three chapters being devoted to this subject. These are very good, and the author gives as clear an explanation of the self-synchronising of a convertor, as is possible, without the aid of mathematical analysis. We see no reference to the use of a double winding for the stator of a starting motor. An interesting chapter deals with static balancing, and with inverted running. Transformers for rotary convertors are then considered in an elementary way, and the various connections for phase conversion are clearly worked out. The final chapter deals with the principles of the motor convertor, with notes on starting, static balancing, and inverted running.

We can recommend this book without hesitation to those for whom it has been written, and we think that all engineers who are not specialists in the design or operation of rotary convertors, will gain much useful information by a perusal of its pages. Should a subsequent edition be called for, a chapter on the automatic control of rotary convertors might well be added.

Published Specifications.

Compiled expressly for this journal by a firm of Chartered Patent Agents. The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1925.

Trade Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from March 16th :—

Pervana. No. 473,957. Class 8. Electrical transformers for use in connection with radio-telephony and telegraphy.—Radioland Co., Ltd., 65, Houndsditch, E.1.

Goldstream. No. 477,523. Class 8. Apparatus for use in radio-telegraphy and telephony.—Julius Axelrad, 25, Mornington Crescent, N.W.1.

Leonardian. No. 477,391. Class 13. Lead tee boxes or service branch boxes for electric cables.—T. L. Watkins, 52, Oxford Street, Kidderminster.

Esboilith. No. 474:891. Class 50. Casein in sheets and rods for industrial purposes, electrical fittings, &c.—Ellenberger & Schrecker, 94, Burgegnstrasse, Frankfort. (British representatives: Sir Joseph Causton & Sons, Ltd., 8, Portugal Street, Lincoln's Inn, W.C.2)

Megalon. No. 476,276. Class 50. Insulating substances (electrical).—Thomas De La Rue & Co., Ltd., 110, Bunhill Row, E.C.1.

Turbax. No. 476,740. Class 50. Electrical insulating materials composed of textile fabrics and synthetic resin or other similar substances compressed into a homogeneous product and made into sheets, rods, tubes, and mouldings.—Dacier, Ltd., 15 and 16, Jewry Street, E.C.3.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

ALSCOTT (Salop).—Sugar beet factory; Perry & Co., Ltd., contractors, Bow, London.

AUSTRALIA (Granville, N.S.W.).—Factory, for the Goodyear Tyre & Rubber Co. (£300,000).—*Reuter's Trade Service* (Sydney).

AYR.—Police Offices; the Chief Constable.

AYRSHIRE.—Additions to Davioshill Hospital; medical superintendent.

BARROW-IN-FURNESS.—Secondary school (£35,000) for the borough E.C.; director of education.

BIRMINGHAM.—Extensions, Cripples' Institution; Cripples' Union.

BOLTON.—Branch library, Moorfield estate; Borough Librarian. 50 houses, Kingscourt Avenue and other streets; Leigh Bros., Ltd.

BOURNEMOUTH.—Central store, Commercial Road; F. W. Woolworth & Co., Ltd. Warehouse, Malmsbury Park Road; William Dibben & Sons.

BRIGHTON.—Alterations, 157-162, Western Road; Boots (Chemists), Ltd.

BRIGG.—Schools (£13,000 to £15,000), for Lindsey E.C.; director of education, Lincoln.

BURY ST. EDMUNDS.—Schools (£24,000), for the borough E.C.; J. H. Wakefield, secretary. Housing scheme (18), Grove Park, for the T.C.; borough surveyor.

CHESTERFIELD.—Hotel (£9,000); T. S. Wilcockson, architect.

COTFORD (Taunton).—Nurses' quarters, Somerset and Bath Mental Hospital; A. W. Caley, clerk.

DONCASTER.—Additions to municipal offices at 53-54, Hall Gate; B. E. Ford, estates surveyor, 3, Priory Place.

DURHAM.—Additional housing scheme (122), for the T.C.; borough surveyor.

EASTBOURNE.—Additions, Pier Hotel, Cavendish Place; J. Bodle, Ltd. Additions, Claremont Hotel, Grand Parade; B. Stevens, architect. Alterations, Burlington Hotel, Grand Parade; P. D. Stoneham, architect.

FARNBOROUGH (Hants.).—Housing scheme (39), High Street, for the U.D.C.; J. E. Hargreaves, architect, Town Hall.

FIFESHIRE.—Extensions at Cupar Beet Sugar Factory (£85,000); the Manager. Secondary school at Dunfermline for Education Authority; Clerk, Education Authority, Kirkcaldy.

FRIMLEY (Surrey).—Housing scheme (50), for the U.D.C.; surveyor.

FROME.—Housing scheme (48), Keyford, for the U.D.C.; surveyor.

GLASGOW.—Hall, Alexandra Parade, for Martyrs' Christian Bond.

GRANTHAM.—Extensions to George Hotel, for Lord Dysart. Central schools, for Kesteven E.C.; C. B. Metcalfe, county architect, Sleaford.

GRAVESEND.—Electric light installation, Sanatorium; borough medical officer of health. Houses (114), for the T.C.; the Calway Construction Co., Ltd., builders, Marlow, Bucks.

GREENOCK.—Extension of the Royal Infirmary; secretary.

HALIFAX.—Modernising electric light system, Stannery Congregational Church; Rev. Keyworth Lloyd-Williams, pastor. Private hotel, café, and shop premises, near Shibden Park, Stump Cross; G. B. Oddy, architect, Ward's End Chambers.

HARROW.—Wesleyan Church, North Harrow (£5,175); trustees.

HASTINGS.—Garages and showrooms, The Green; Callow and Callow, architects.

HORNCHURCH (Essex).—Factory, Hornchurch Road, for the Art Metal Construction Co.

HOYLAKE (Birkenhead).—Cottage Hospital extensions (£10,618); William Fleming & Co., builders, Neston.

HULL.—Wesleyan Church, Newland (£16,250); trustees.

IRISH FREE STATE (Cork).—Development of Cork Harl ou (£150,000); Harbour Board.

KIRKCALDY.—136 houses for Corporation (£60,920); burg surveyor.

LANCASHIRE.—Bridge improvements (£80,000); county su veyor.

LEEDS.—Shopping centre, off Stainbeck Lane; Carr Manc Estate Co., Ltd.

LINCOLN.—Secondary schools (£25,000), and elementar school, Skellingthorpe Road (£8,500), for the city E.C. director of education.

LONDON (East Ham, E.).—Tuberculosis dispensary, Barkin Road; medical officer of health.

(Ilford, E.).—School, Barkingside (1,100 places), and exter sions, Stevens Road Schools (800 places), for the boroug E.C.; Adam Partington, clerk.

(Romford, E.).—Houses (46), Seymour Road, for Warrine and Herd.

(Highgate, N.).—Electrical installation, ten blocks of flat Holly Lodge Estate, Makepeace Avenue; Central Londo Building Co.

(N.W.).—Restoration of Regent Square Presbyterian Churc (£10,000); trustees.

(St. Pancras, N.W.).—5 blocks of tenements, Somers Tow area; borough engineer.

(Lewisham, S.E.).—60 houses, Cranston Road Estate; Clou and Tysoe, Ltd.

(Woolwich, S.E.).—Schools, Eltham Housing Estat (£37,084), for the London E.C.

(Westminster, S.W.).—Reconstruction, Westminster Circu lavatories (£17,750); City engineer.

(Fulham, S.W.).—Buildings, Peterborough Road; H. N Barnes, Ltd.

(Merton, S.W.).—Housing scheme, Whatley Estate (100 for the U.D.C.; G. Jerram, surveyor.

(Streatham, S.W.)—Housing estate development, Elmfiel Estate; D. P. Hayworth.

(King's Cross, W.C.).—Extensions, Royal Free Hospita Governors.

LLANTARNAM (Mon.).—280 houses; U.D.C. surveyor.

LOUTH.—Schools, Monk's Ryke Road (£19,000), for Lindse E.C.; director of education, Lincoln.

LUTON.—Girls' schools, with electrical work, for Beds. E.C S. C. Parrott, architect, 9, George Street West.

MAIDENHEAD.—Houses (55), Boyn Hill, for the T.C William Creed & Co., builders.

MALVERN.—School of Art and Technical School, Albe Road; Worcestershire Education Committee.

MOFFAT.—Wing at Cottage Hospital; the medical superi tendent.

NORTHFLEET.—Additional 52 houses, for the U.D.C.; su veyor.

OXFORD.—Extensions, Eagle Ironworks, Walton Well Road W. Lucy & Co. Additions, works, Arthur Street, Oxfor Electric Co., Ltd.

ROTHERHAM.—Church, Lord Street; Lieut.-Col. J. H Knight, architect.

SHEFFIELD.—Wesleyan Church, West Street (£12,000) trustees.

SOUTHAMPTON.—Wesleyan Church, St. James Roa (£19,700); trustees.

STOCKPORT.—Kinema, Wellington Road South, for Thom Blower, 12, Lowfield Road.

SUTTON (Surrey).—Additional 34 houses, for the U.D.C surveyor.

WELLINGTON (Salop).—Housing scheme (30), Orleton Lan site, for the U.D.C.; William Walker, surveyor, Walke Street.

WEST MELTON (Yorks).—Houses (108); Frederick Bat builder, Doncaster.

WEYMOUTH.—Additions Nurses' Home, Weymouth Ho pital, Melcombe Avenue; Crickmay & Sons.

WORCESTERSHIRE.—Smallpox Hospital; medical officer Health.

YORK.—Housing scheme (74), Tang Hall Estate, for the T.C. F. W. Spurr, city engineer.

The

Electrical Review

VOL. C. APRIL 1, 1927. No. 2,575.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Alleged Thefts of Electricity.

THE fact that cases or, at any rate, reported cases of alleged thefts of electricity are comparatively rare, may often be a reason for believing that the practice of stealing current from the mains is not very common. But it is a probability or difficulty against which those who supply electricity must continually be on their guard; and the necessity for vigilance increases not only with the number of consumers, but with the extension of supply to persons who, in these days of popular electrical pursuits, are acquiring sufficient knowledge to enable them to "dodge the meter."

A recent case decided in Scotland, which was noted in these columns a week or two ago, seems to indicate that some change in the law may be necessary if electricity undertakers are to be adequately protected. A man was charged with altering the index of a meter under his custody and control with a view to fraudulently preventing it from duly registering the quantity of electricity supplied. There was evidence to show that the meter in question had been tampered with.

In the language of the Sheriff who tried the case: "It was discovered that the pointer of the third or 'hundreds' dial on the index had been forced backwards, so that it did not synchronise with the pointers of the second and fourth dials. On the index plate a scratch was seen which was apparently made by the instrument used to force back the said pointer." The learned Sheriff then went on to say that as the meter had at all material times been on the premises of the accused, who was the only person who stood to benefit by the alteration of the index, it might be a natural inference that he made the alteration. But he then pointed out that, the evidence being purely circumstantial, a conviction could only follow if the circumstances should lean, not merely naturally to the inference that the accused was guilty, but so conclusively that no reasonable person could refuse to draw it. As he felt it conceivable that the malice or mischief of some other person who obtained access to the meter

had caused the alteration, he felt he was unable to convict on this ground.

Pausing here, there can be no doubt that the learned Sheriff made an accurate statement of the criminal law as it applies not only in Scotland, but also in England. A usual example of an "irresistible presumption" which is given by those who teach the law is this: "If a man is seen coming out of a public-house wiping his mouth with the back of his hand, there is an irresistible presumption that he has had a drink." Whether the learned Sheriff was right in deciding that the presumption of guilt did not arise, is another matter, upon which another tribunal might differ from him; but the case as formulated against the renter of the meter did not stop there. The prosecution relied on the final paragraph of Section 38 of the Gas Works Clauses Act, 1871, upon which the complaint was made. It reads: "The existence of artificial means for causing such alteration or prevention, or for abstracting, consuming, or using electricity of the undertakers when such meter is under the custody or control of the consumer, shall be *primâ facie* evidence that such alteration, &c., as the case may be, has been fraudulently, knowingly, and wilfully caused by the consumer using such meter." While recognising the force of this provision, the learned Sheriff pointed out the obvious fact that the prosecution had not proved the existence of any "artifice or device," as, *e.g.*, a bypass or short circuit. Consequently this clause did not throw upon the accuser the burden of disproving anything. In the result the charge was held "not proven." Curiously enough, reliance upon this final paragraph in Section 38, so far from increasing, may have done something to lessen the chances of securing a conviction in this particular case. The criminal law is at all times very jealous of the principle that every charge shall be proved against the accused person. He need say nothing: the whole of the facts must, as a rule, be established by affirmative evidence led against him. In certain cases, however, the onus of proof is shifted. Thus, on a charge of "receiving," it is sufficient to prove that a man is in possession of stolen goods. He must then explain affirmatively how they came into his possession. So in the case under notice, certain things are roundly declared to be *primâ facie* evidence against the accused, and the very fact that the statute says "this particular thing" (*i.e.*, the presence of a short circuit) *shall be primâ facie* evidence, raises the presumption that no other "particular thing" (*i.e.*, the actual reversal of the meter and the scratch on the dial) shall be *primâ facie* evidence. As the lawyers say, *Expressum facit cessare tacitum.*

Enough has been said to justify the view that the decision in the case before us was right and in accordance with law. Yes; but what law? The provisions of an Act of Parliament adopted from an earlier measure intended to regulate the supply of gas, and passed in the year of grace 1899! Notwithstanding the experience of nearly three decades, it never seems to have occurred to anyone that the machinery for preventing fraud in relation to the supply of electricity might be overhauled and improved. Let one suggestion suffice. What honest man would suffer if it were enacted that: "The fact that any meter shall have been opened otherwise than by or with the authority of the undertakers while such meter is in the custody or control of the consumer, shall be *primâ facie* evidence that such alteration or prevention, &c. (*as the case may be*) has been fraudulently, knowingly, and wilfully caused by the consumer using such meter"? The Legislature last year rushed through Parliament an Act which *may*, in the long run, enure for the benefit of those who supply and consume electricity, and which *must* be fraught with considerable outlay. Would it be too much to ask them to introduce one small reform which *must* assist the detection of fraud, and is almost certain to involve little or no expense? But there is little *kudos* attaching to a one-clause Act of Parliament!

The Future of the Fair.

We notice an editorial in *The Times* Trade and Engineering Supplement regarding the future of the British Industries Fair. Our contemporary discusses a point which has been considered in our own pages and in many conversations that have taken place during the last year or two. Recognising that the London part of the Fair has now outgrown the accommodation available at the White City, the writer mentions as possible alternatives the building of a Fair Hall at a cost of £500,000, the scattering of various sections in separate buildings, thus making a number of decentralised little exhibitions, the preparation of additional buildings at the White City, or removal to the Crystal Palace. Some of these we would dismiss without further thought—especially the last. In our view there are two other alternatives which may offer a better solution. One is that, if part of the Fair must be continued in London, the allocation of trades be revised so that some sections that are related to the character of the exhibits for which Birmingham Section has now become thoroughly established, may be removed there. Wireless apparatus and the other things that interest the electrical, engineering and allied trades may be quoted as a typical class which would be more at home in the Midlands, and would enable some firms either to avoid dividing their displays or to be in their natural atmosphere and environment. Our other suggestion may be regarded as a sweeping one. There is abundance of site accommodation available at Birmingham. If new buildings have to be erected, why not there? Could not the whole undertaking be removed to this one centre?

Scientific and Industrial Research.

The annual report of the Department of Scientific and Industrial Research, which is abstracted elsewhere in this issue, contains much interesting reading. The Department has now been in existence for ten years, and the work accomplished during that period is reviewed by the Advisory Council, with pardonable self-satisfaction; it is held that we are witnessing to-day an "industrial revolution" fully comparable with that which followed the Napoleonic wars—"a revolution from haphazard empirical methods to those of scientific control and direction. Our industrial research policy must be directed to help British industry to make this inevitable change." It is gratifying to learn that the Council observes many signs of a change in the attitude of manufacturers towards research; many industrial firms are rapidly developing their scientific organisations, and establishing large research laboratories where funds permit—but still it is urged that the value of a continuous policy of research and scientific development is not yet fully realised. The country must learn that progress can be more efficiently secured by scientific methods than by the costly process of trial and error.

Much of the work of the Department is described as "helping industry to help itself"; this, we believe, was the original purpose of the "Million Fund," which was placed at the disposal of the Department exactly ten years ago. The intention of the Government, as expressed by Lord Crewe (Electrical Review, December 8th, 1916, p. 641), was to devote to the work "a very large sum, estimated to cover the needs of the next five years, on a scale which would enable them to spend four or five times as much on industrial research alone as the whole scheme had previously received." "Besides the lump sum above-mentioned, an annual vote would be provided to cover the expenses of the Department, to assist researchers and societies that were carrying out researches, and non-remunerative research."

That the Department has exercised strict frugality in releasing its hoarded funds will be realised when we state that the balance of the Million Fund at March 31st, 1926, was £429,984; its average annual outlay from this trust fund has therefore been about £64,000—less than one-third of the rate anticipated in 1917—and the Fund which was expected to cover five years' needs has

already lasted for nine and is still going strong. In view of the declared importance of stimulating industrial research and the urgent need of funds for that purpose, we think the Department might well adopt a more liberal attitude towards research associations of proved efficiency. It is true that according to the Advisory Council the electrical industry is in a particularly healthy position with regard to research in general, but for this it owes little to the Department, which proposes to withdraw its financial support from the Electrical Research Association after September, 1930, although the operations of that admirable Association are hampered by lack of funds. As regards the support of "pure scientific research," which is the father and mother of all industrial progress, the Department is lavish of protests of its kindly feelings towards it, but apparently limits its financial aid in general to those "pure" researches which have a direct relation to industrial research and a "practical aim"—a distinction from "industrial research" without a material difference.

Registered Contractors.

Further progress was reported at this week's annual meeting of the Board of the National Register of Electrical Installation Contractors. Apart from the routine business, discussion centred around two points—wiring rules and the "small" man. With regard to the former, it was stated, unofficially, that the E.C.A. had adopted an abbreviated set of rules. This, no doubt, had reference to the abridged version which the I.E.E. Wiring Rules Committee commissioned the E.C.A. and the Association of Supervising Electrical Engineers (*née* N.A.S.E.) to produce jointly. Col. Crompton gave it as his opinion that the I.E.E. Rules, as they stood at present, were far too complicated for the ordinary contractor, and therefore could not be enforced by any body; they were, however, useful as recommendations and might possibly be considered as such eventually. Several members drew attention to the danger that compulsory regulations would seriously deplete the Register, but Mr. Cash was not unduly perturbed at that. He thought that such a "purge" would probably be all to the good of the better contractors, who would be able to stand increased registration charges.

Dealing with the question of the "small" man without proper, separate, business premises, Mr. Cross (Newcastle) thought that the Executive was not strict enough in its requirements regarding business qualifications. Mr. Purse, however, pointed out that the "small" man was not necessarily a bad contractor. This is certainly true if such men do not over-reach themselves, and in endeavouring to do too much pay too little attention to the quality of their work. Mr. Purse was ready with a remedy for this, stating that the cancellation of registration was a far more effective check than non-registration.

As opposed to this view of the small man, Mr. Shaw (Manchester) drew attention to the fact that many big firms had not become registered. The Committee was thus asked to attend to both ends of the contracting scale: to exercise extra discretion in registering small men, and to exert pressure upon the large firms to join and add to the prestige of the scheme.

London's Electricity Supply.

For the last time, the London County Council has issued its useful report on electricity supply in the London area, which, commencing with the County alone in 1901, has increased in scope until, since 1919, it has covered the whole of the London and Home Counties Electricity District, embracing a population of over eight millions. The extraordinary complexity of the electricity supply situation in that area of 1,797 square miles is well illustrated by the coloured map which accompanies the report; although there are considerable portions of the area in the north-east and south which, thinly populated, have no supply of electricity, there are no fewer than 89 authorised distributors in the District. Nowhere else in the world can there be found a "crazy patchwork" such as this, the product of misguided legislation, which deliberately aimed at segregation and decentralisation—the antithesis of modern views and of the course of natural development.

We abstract the report elsewhere in this issue, and will comment on it later; but we take this opportunity of complimenting the London County Council upon the good service which it has rendered to the public by the compilation of these excellent reports, for which it deserves the hearty thanks of the electricity supply industry.

The Central Electricity Board.

Elliott & Fry] *[London.*

Electricity Supply at Ealing.

Abandoning the generation of electricity in favour of a bulk supply has modernised the system, involving the change-over of some 14,000 consumers' installations within three years of commencing to build the large new bulk-supply distributing station in Pope's Lane.

In order to modernise its electricity undertaking in conformity with the Electricity Commission's ruling, the Ealing Corporation decided to scrap its old steam-driven a.c., 40-cycle generating plant and has built in its stead a large bulk-supply distributing station in Pope's Lane.

In the new transformer-station buildings (fig. 1) accommodation is provided for the technical staff, and extensive workshops, meter test room, &c., and storage room for apparatus which is to be hired out to consumers, power to do so having been exercised some years ago, but remaining in abeyance during the war period. Special attention has been devoted to ventilation, which is assisted by electric fans, and lighting and heating are electric throughout: all the water for the lavatories and various mess rooms is heated electrically also, different makes of apparatus having been installed for comparative purposes. That portion of the buildings in which the electrical plant is housed has been made fireproof; the roof is formed of concrete slabs in steel framework, covered with slate, and all metal throughout the buildings has been thoroughly earthed; scrap 0.25 sq. in. copper cable has been utilised for this purpose, carried down to the water-bearing stratum and coiled therein to form numerous "earth plates."

Fig. 1.—New Bulk Supply Distributing Station at Ealing.

The cost of the scheme has been enhanced somewhat by the fact that the Electricity Commissioners fixed the location of the 6-acre site of the new station in close proximity to one of the main cable routes of the Metropolitan Electric Supply Co., Ltd., from which the Corporation purchases 50-cycle, 3-phase electricity in bulk at 20,500 volts. It is instructive, too, to note that had the Commissioners maintained their original intention of specifying 3-phase distribution, the cost of the scheme would have exceeded £500,000, whereas considerable economy has resulted from the adoption of the arrangement outlined diagrammatically in fig. 4, which enables single-phase distribution to be carried out from "A" and "B" phases. Cost has also been influenced by the following facts:—The Metropolitan Co., in virtue of its statutory powers, has a right (which it declines to modify) of varying its pressure 12.5 per cent. above the declared voltage, whereas the Corporation is bound not to exceed a voltage variation of 4 per cent., and consequently it became necessary to provide booster regulating transformers, which have cost very nearly as much as the main transformers.

The Metropolitan Co.'s portion of the e.h.p. switchgear (supplied by the British Thomson-Houston Co., Ltd.) controls the bulk supply for the Ealing district as obtained either from Ironbridge (Hanwell) or Acton. It is designed to withstand a working voltage of 33 kV, as this increase of voltage is contemplated by the Metropolitan Co. at a later date. The e.h.v. apparatus is accommodated in separate cubicles, which are subdivided into the requisite number of compartments to ensure fireproofness. The cubicles are constructed of moulded-stone slabs and are divided vertically, the oil circuit-breakers and main isolators being assembled on one side of the partition, with the busbars and the remainder of the apparatus on the other side (fig. 2) and the sheet-steel doors are locked by "Castell" locks that have a different change number for each equipment: this method of locking is relied upon in lieu of any definite mechanical interlock.

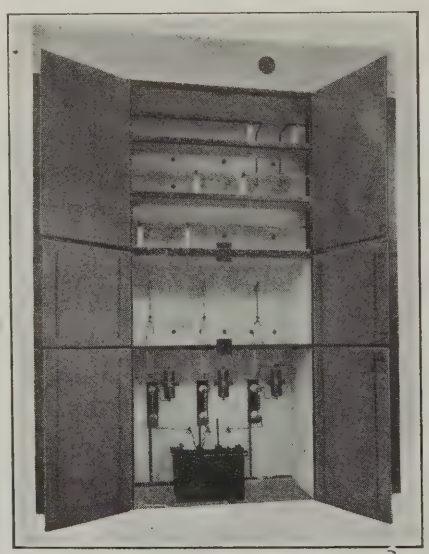

Fig. 2.—E.H.P. Bus-bar Cubicle.

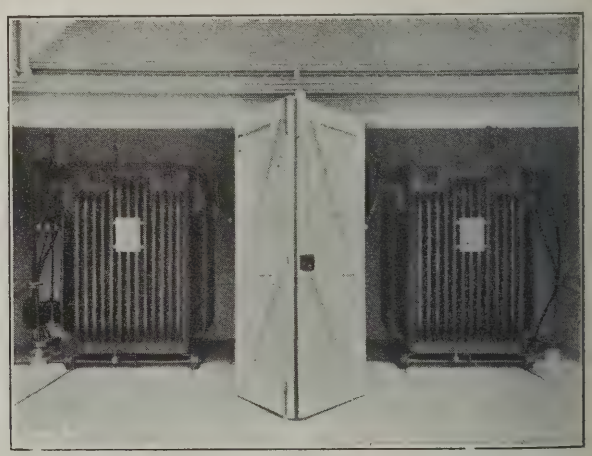

Fig. 3.—Main 20,500-volt Transformers.

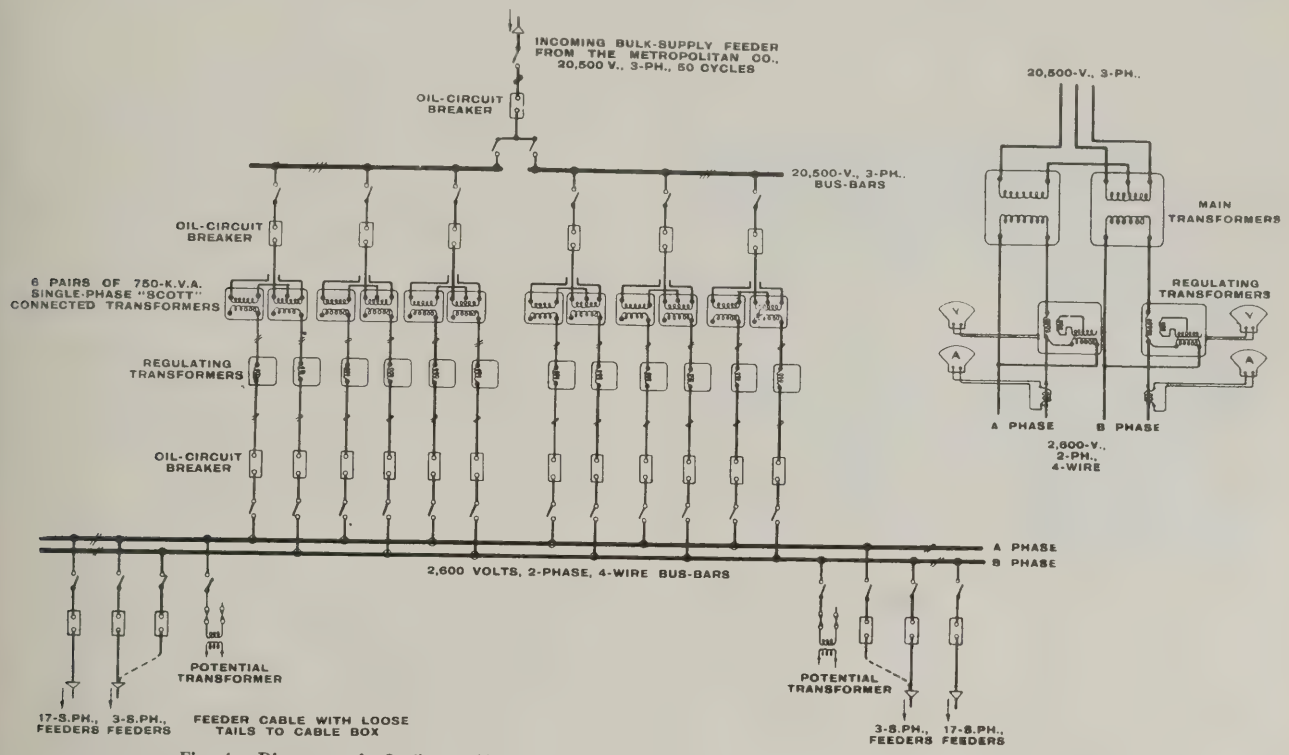
An important feature is the lay-out of the metering

equipment. The busbar current transformers are located in the bottom cell of the cubicle on the breaker side; each transformer is connected in series with its respective busbar, a single-pole isolator being placed on each side of it to afford complete isolation. To maintain continuity of supply to the consumers' equipment during such isolation, each transformer can be short-circuited by another isolator.

Each 20-kV control panel is totally enclosed in a steel surround (fig. 5): the oil-immersed circuit-breakers are of the OMI/A1 type and have a normal rating of 300 amperes at 33 kV. The Merz-Beard protective system has been applied to both ends of these feeders.

The main transformers, fig. 3 (made by the British Electric Transformer Co., Ltd., as well as the boosters) are housed in separate brick cubicles outside the main station buildings. Twelve 750-kVA, single-phase, 20,500/2,600-volt transformers are being Scott-connected to form eventually six 1,500-kVA banks, giving a 2-phase, 4-wire supply at 2,600 volts; each phase passes through a regulating transformer to a 2-phase, 4-wire switchboard (fig. 8).

The present equipment consists of four complete sets of transformers of 1,500 kVA capacity each; the two limbs of each set are in separate oil-tight tanks, and constitute interchangeable limbs for Scott working. They are equipped, in addition, with externally-operated tapping switches on the e.h.p. side to compensate for $2\frac{1}{2}$, 5, $7\frac{1}{2}$ and 10 per cent. increase of the primary voltage, the secondary pressure meanwhile being kept constant at 2,400 volts.



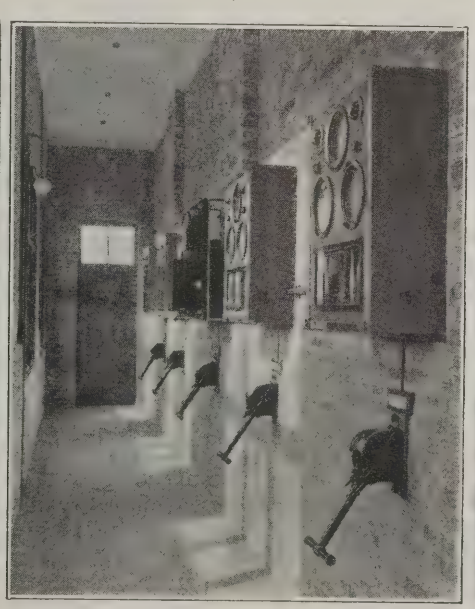


Fig. 4.—Diagrammatic Outline of Transformer Connection Scheme; 3-phase incoming, single-phase outgoing.

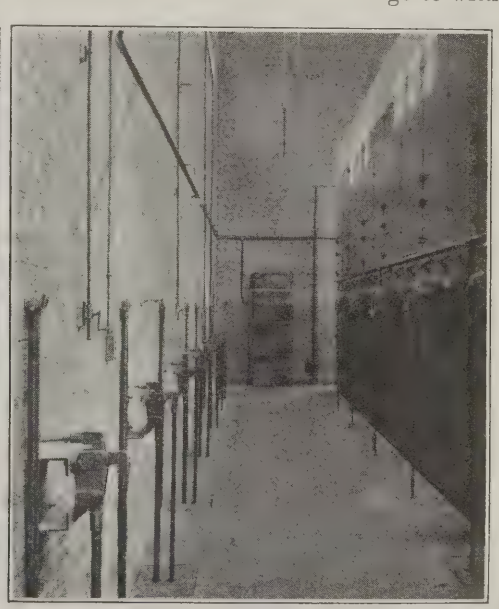

The single-phase regulating transformers (fig. 8) are equipped with hand-operated regulating switches and capable of giving a plus or minus $12\frac{1}{2}$ per cent. boost to the line in ten $1\frac{1}{4}$ per cent. steps either way. All the transformers are of the Berry radial pattern, oil-immersed and self cooled.

The main transformers have braced windings to withstand possible short-circuit stresses, and the end turns are reinforced to withstand line surges; the main insulation consists of Bakelite Micarta cylinders between the winding, and the disposition of the coils is such that cooling oil is in actual contact with every turn. Each boosting transformer consists of two limbs mounted one on top of the other in the same tank, the boosting volt-

Fig. 5.—E.H.P. Feeder Control Panels.

Figs. 6 and 7.—Control Gear and 20,000-Volt Switch Cubicles.

age in the main feeder being controlled both in magnitude and polarity by means of regulating switchgear attached to the tanks.

The guaranteed efficiencies for the entire transforming plant are 98.25 per cent. on full load, 98.4 per cent. on three quarters and half load, and 97.8 per cent. on one quarter load.

The Corporation's switchgear installation, which formed the main part of the contract, was carried out by the English Electric Co., Ltd. It includes the main incoming supply feeder and 6 complete 3-phase transformer equipments, all for 20,500 volts: also 60 sets of single-phase equipment, as follows:—12 trans-

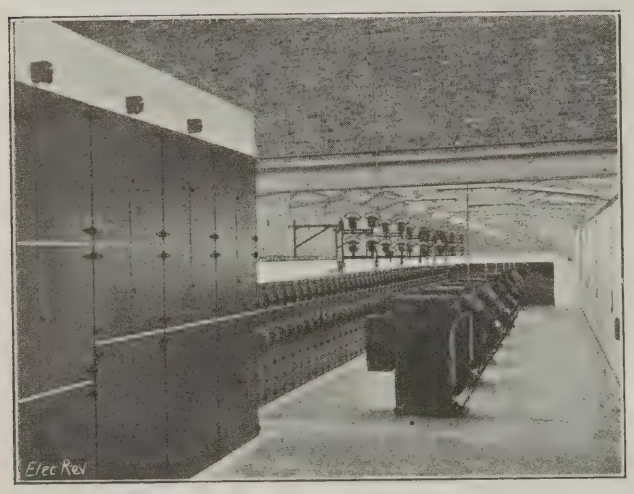

Fig. 8.—General View of Station Interior.

former control equipments; 17 feeder equipments on phase "A" and 17 on phase "B"; 6 feeders, each with 2 switching equipments for connection to either phase "A" or "B"; 2 potential transformer metering equipments, one on each phase. The general scheme of connections (fig. 4) shows that the 3-phase, 3-wire, 50-cycle incoming supply feeds through an oil-immersed circuit-breaker equipment on to the two halves of a single set of 20,500-volt, 3-phase busbars, sectionalised by means of a double set of isolating switches in the incoming feeder equipment, so that at times of light load one half of the bars can be made dead for inspection, &c., whilst the supply is maintained through the other half. In addition, there are six swinging brackets, each carrying a set of paralleling and load-regulating ammeters and voltmeters, one set for each transformer group. The method of connecting these voltmeters is somewhat novel (fig. 4 inset), the connections having been taken from tappings on the shunt windings of their associated regulating transformers to enable a considerable saving to be effected in potential transformers.

Both the high- and low-voltage switchgear is contained in stone cellwork cubicles. The 20,500-volt oil circuit breakers are manually operated, the control portion being divided by a brick wall from the cellwork, as shown in figs. 6 and 7: the former shows the control handles mounted on the brick wall with the instruments in sheet-metal cases above; the latter shows the back of this wall, the operating rods, and cellwork.

These breakers are of class O.K.B., size O (600-ampere), with a rated rupturing capacity of 350,000 kVA (at 25,000 V). Three single-pole switches are united by means of Oldham couplings, and the phases are separated throughout by stonework barriers, the opposite side of the 20,500-volt cubicles being visible in the foreground of fig. 8, which is a general view of the interior of the station, showing the 60 single-phase equipments along the far end, and some of the regulating transformers can be seen along the centre; the main transformers are outside the right-hand separating wall of the building. All the 2,600-volt single-phase feeder equipments are also housed in stone cellwork with barriers between phases; a closer view of this gear is fig. 9, which shows the equipments for the two phases and one of the transformer banks. It will be noted that the isolating switches in the upper compartments are operated by a removable handle, padlocked covers over the handle openings preventing unauthorised operation. Each single-phase equipment is controlled through two single-phase oil circuit breakers coupled together: the couplers' carrying capacity is 800 A, each with a breaking capacity of 150,000 kVA (at 6,600 V), whilst the feeder switches' carrying capacity is 400 A each, with a breaking capacity of 75,000 kVA (at 6,600 V).

The breakers are of the spring-tank type, the patented feature of which design is that the oil in the tank reaches the level of the bottom of the top frame, which projects inside the tank, the latter being suspended on springs combined with the tank bolts to allow the necessary cushioning action on opening circuit. The absence of an air cushion is claimed to prevent the formation of an explosive mixture within the tank, any gases formed on opening being allowed to leak out around the sides of the top where it projects into the tank.

A simple system of overload and leakage protection has been applied on the 20,500-volt side, with reverse-power protection on the transformer equipments on the 2,600-volt side; simple overload protection is provided for the single-phase outgoing feeders. Cables inside the station were supplied by Messrs. Siemens Brothers and Co., Ltd., and all outside cabling is being carried out by the Corporation's staff.

In conclusion, it may be recorded that £200,000 has already been sanctioned for the conversion scheme. It was unfortunate that the scheme was initiated prior to the Electricity (Supply) Bill, 1926, becoming an Act of Parliament, for the Corporation thereby became ineligible for financial assistance from the State electricity authorities.

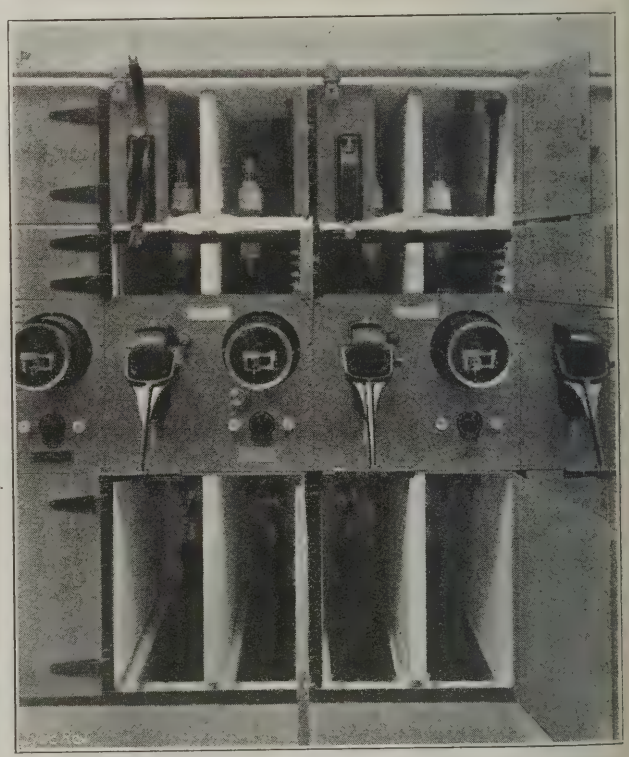

Fig. 9.—Single-phase, 2,600-V Feeder Equipment.

Finally, it is a pleasure to express our indebtedness to Mr. J. Douglas Knight, chief electrical engineer to the Ealing Corporation, who has been solely responsible for carrying out the scheme, for permitting his new station to be inspected and described, and to the manufacturers concerned for the photographs of the plant reproduced above.

A noteworthy feature is Mr. Knight's expressed appreciation of the manner in which the main contractors, the English Electric Co., Ltd., carried out the work, and the spirit of co-operation shown both with him and with the sub-contractors.

Canadian and United States Electrical Trade.

Customer and Competitor.

In the Electrical Review of January 21st an article was published showing the trend of the electrical trade in some of our chief oversea markets. In the succeeding issue a review of Great Britain's imports and exports of electrical goods during 1925 and 1926 was given. Both these articles were illustrated by graphs. It is now proposed to survey the electrical trade of Canada and the United States. The former cannot be considered as one of our chief markets,

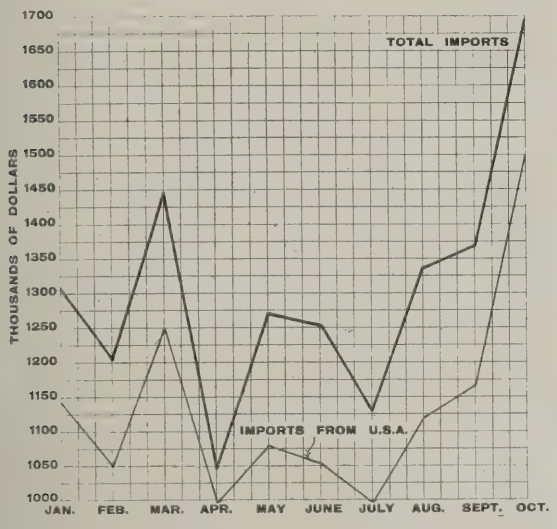

Fig. 1.—Canadian Electrical Imports, 1926.

although, as will be seen later, there are in certain directions better prospects than may generally be supposed. In some classes, *e.g.*, domestic appliances and ignition apparatus, Canada seems likely, however, to rival Great Britain. As to the United States, she stands as a strong competitor. The present article includes curves showing the course of Canada's electrical import and export trade in aggregate and in the classes of goods of outstanding interest to this country, and also the course of United States exports.

The upward curve of imports of electrical apparatus

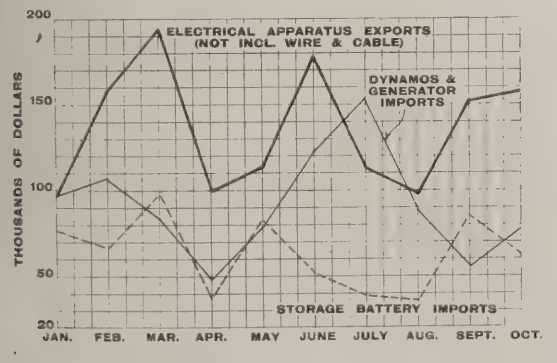

Fig. 2.—Canadian Imports and Exports, 1926.

into Canada should inspire British manufacturers with fresh efforts to capture a larger share of this trade, most of which, it will be seen, goes to the United States. One serious disability under which our makers still suffer is the long prevailing practice of submitting most of the electrical equipment intended for use in the Dominion to the tests of the Chicago Underwriters' Laboratories. But the concern which is virtually the largest buyer of electrical plant in Canada, *viz.*, the Ontario Hydro-Electric Power Commission, has power to pass equipment, and in this circumstance British firms have good prospects of consideration. This subject has been discussed again and again in these pages, and we refrain from further comment in this article as we shall be dealing somewhat fully with the latest developments in the situation in our next issue.

Mr. F. W. Field, H.M. Trade Commissioner in Canada, mentions in his report that hydro-electric developments offer an outlet for a fair amount of machinery and supplies of British manufacture. The

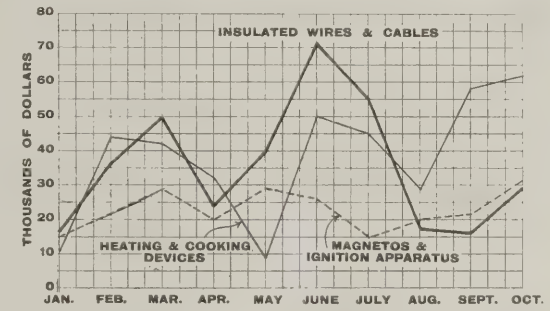

Fig. 3. Canadian Electrical Exports, 1926.

waterwheel type of a.c. generators, he says, represents the principal demand in electrical rotating machinery. Some units up to 6,000 kVA are of the horizontal type, but most of the machines from 500 kW to 50,000 kW are of the vertical type. These alternators are mostly in two frequencies, namely, 25 cycles or 60 cycles. They are all three-phase, and the standard voltages are 2,400, 6,600 and 13,200. With regard to transformers, the Trade Commissioner says that there is a good demand for various sizes from 1 kVA to 20,000 kVA, mostly single-phase. The large transformers are of the oil-immersed, water-cooled type, and the small transformers are mostly oil-immersed, self-cooled. The frequencies are 60 cycles and 25 cycles, and the standard voltages range from 2,200 to 220,000. In transformers for voltages up to 66,000, the competition from local manufacturers is very keen, and there appears to be little reasonable chance of making a profit under pre-

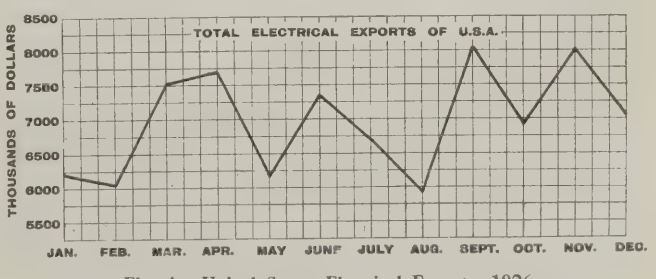

Fig. 4.—United States Electrical Exports, 1926.

sent conditions. The City of Winnipeg recently received tenders for 5,000 kVA 60-cycle transformers, including freight, duty, sales tax and oil in accordance with very strict specifications and conditions at a price less than $2 per kVA.

On the subject of motors, Mr. Field points out that most of those purchased are of the squirrel-cage

induction type for frequencies of 25 and 60 cycles. They are all three-phase, and the standard voltage is 550. Larger motors are supplied when desired for 2,200 V. A number of the pulp mills use self-starting synchronous motors of about 2,500 h.p. at 225 r.p.m. There is also a moderate demand for synchronous motors in other industrial plants. For d.c. motors, the demand is limited. Tramway equipments are purchased from time to time by the various street railway systems.

Finally, the Trade Commissioner remarks that as most of the power development is hydro-electric, the demand for steam turbine generating plants is limited. A few plants are in operation in the prairie provinces where little or no water power is available. In this section, however, the population is relatively small, and until water powers throughout Canada, within commercial distances, are developed to their capacities, there will not be a great demand for steam-generating plants.

From the charts relating to Canadian import and export trade in electrical apparatus (figs. 1, 2 and 3),

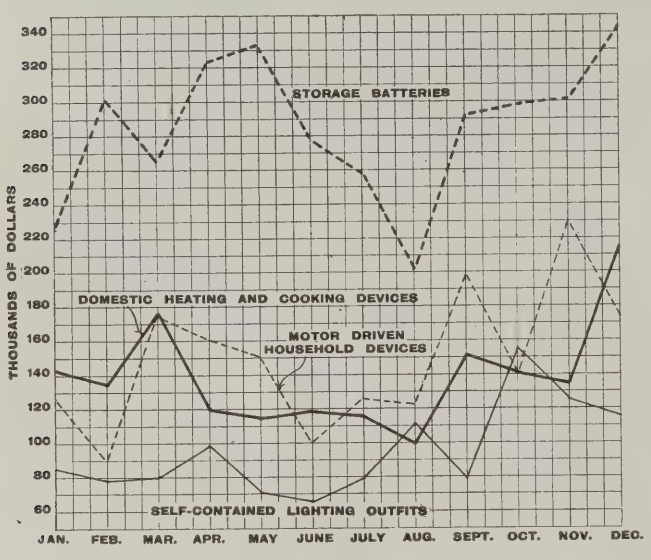

Fig. 5.—United States Electrical Exports, 1926.

it will be seen that the value of the imports of dynamos and generators in some months has not been far removed from the total value of the exports of electrical apparatus as a whole. Among imports, storage batteries are an important item, while on the export side, heating and cooking devices and ignition apparatus loom large.

The statistics of American exports of electrical machinery and apparatus for last year (fig. 4) show an increase of 14 per cent. in the total as compared with 1925. The detailed figures for the two years were published in our issue of March 18th (p. 447), and the list shows many notable increases; at the same time there were several large falls. So far as the classes shown in fig. 5 were concerned, there were rises in the exports of storage batteries, motor-driven household devices, domestic heating and cooking devices, self-contained lighting outfits and stationary motors (1 to 200 h.p.). In the cases of radio apparatus, a.c. generators (2,000 kVA and over) and ignition apparatus (fig. 6), there were decreases.

In view of the great progress made by British manufacturers in recent years in the design and execution of switchgear, notably for high voltages, it is interesting to examine the records of American exports of this class, and to compare them, as far as possible, with those of British exports. The United States figures are as follows:—

United States Exports.

	1924.	1925.	1926.
	£	£	£
Switchboard panels, except telephone	432,000	461,000	438,600
Switches and circuit breakers over 10 amps.	450,000	485,000	523,600
Total ...	£882,000	£946,000	£962,200

Although no statistics of British exports of control and switchgear in 1926 are yet available, owing to lack of detail in the classification adopted in the monthly returns, a striking advance is shown between 1923 and 1925, as will be seen below:—

Great Britain's Exports.

	1923.	1924.	1925.
	£	£	£
Switchboards, other than telegraph and telephone	103,000	91,000	88,010
Control and switchgear	522,000	945,000	1,360,000
Total ...	£625,000	£1,036,000	£1,448,000

It is reasonable to assume, in view of the large increase in the total exports of electrical goods generally in 1926 (see page 150 of our issue of January 28th), that there was a further increase in those of control and switchgear also in that year.

The total sales of apparatus and accessories produced by the American radio industry last year amounted in value to about 500 million dollars (say 100 million pounds), an increase, as compared with the previous year, of over one hundred million dollars, or 20 million pounds, although exports were lower. Business at Christmas was reported to be extraordinarily favourable, partly on account of the introduction of new and improved models and partly owing to the spread of broadcasting generally. The development of the American radio industry has been relatively more rapid than that of motor-car manufacture. As in the latter industry, the demand for the necessary raw materials has created unusual activity in a number of other branches of manufacture. For example, there has been a substantial increase in the demand for both hard and soft wood for making the boxes for the apparatus and the packing cases for their dispatch. Competition is very keen among manufacturers, whose

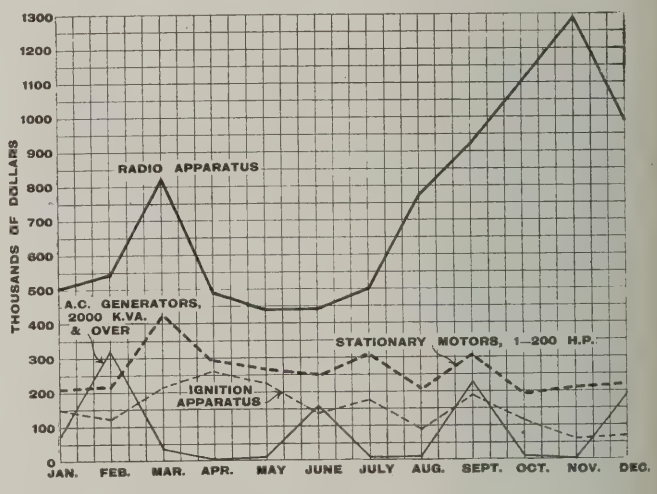

Fig. 6.—United States Electrical Exports, 1926.

profits are limited by the circumstance that the retailers often make 30 to 40 per cent. on certain kinds of apparatus and accessories.

A recent issue of *Commerce Reports* contained preliminary statistics of United States electrical exports during January. The total value is given as $7,711,883, as compared with $7,146,977 in January, 1926. Generally speaking, the increase was due to larger shipments of the lighter electrical equipment; in the heavier classes, such as generators, transformers, motors and transmission and distribution apparatus, there was a decline. The highest individual rise occurred in the case of storage batteries, from $226,363 to $346,520. The radio apparatus group recorded a rise from $499,699 to $611,660. Electric lamp exports also showed a large gain. The greatest decrease was in the item "switchboard panels, except telephones," which fell from $511,687 to $84,643. Other large decreases occurred in the cases of stationary motors, motor accessories and parts, electric locomotives, instruments and domestic heating and cooking devices.

Metal Patterns and Electricity.

Recent improvements in metal pattern-making indicate that the use of electro-deposition and electric heating is advantageous, leading to economy and greater accuracy.

By J. EDGAR.

DURING the last two or three years the art of patternmaking has advanced considerably, and it is generally agreed that for repetition work, metal patterns have advantages over the wooden variety.

Electricity's part in the construction and use of metal patterns is that they are now sometimes made by electro-deposition, and that they are heated by electricity before being used. By electro-deposition, metal patterns are made very accurately, owing to the fact that there is no shrinkage involved: since such patterns are exact duplicates of the original in size, shape, and finish, it is obvious that machining, filing, and scraping operations are practically all eliminated. Patterns can be made of copper, brass, nickel, or any other metal, or combinations of metals (for example, a nickel surface with a copper backing).

The method of procedure is similar to that used in electro-typing. Casts of wax, plaster of paris, or any fusible alloy are taken of the desired pattern to be reproduced; the casts are made with a conductive material on the impression surfaces (in the case of wax, or plaster of paris, graphite is used to make the conductive surface) and contact wires are inserted in the casts to make connections in the plating tank and to the conductive surface of the cast. Suitable insulation is provided to prevent the metal from spreading on to the non-conductive surfaces; the casts are then placed in the appropriate plating solutions, and allowed to remain therein until the desired thickness is obtained. The casts are afterwards taken from the bath and the metal deposits removed, and backed up by some suitable alloy, such as white metal, to give strength, if necessary. The partings are then checked very closely and machined or ground off, if required, from which point onwards the procedure is identical with the old method.

The deposition process can be used for making split patterns mounted on both sides of a plate, split patterns mounted on cope and drag plates, split patterns mounted on one side of a plate, cope, and drag plates when the patterns and plate are cast integrally. Where cast-aluminium match plates are used, cope and drag plates can be very easily substituted by this method. Patterns to be gated can be made in halves and sweated together. This process includes core boxes.

When moist moulding sand is rammed up around a cold metal pattern, a thin film of moisture collects on the surface of the pattern, so that when it is withdrawn from the mould there is a tendency for some of the sand to adhere to it; this causes a roughening of the surface of the mould, so that it will not yield a clean smooth casting. For many classes of work it is essential that the castings be clean and smooth, and therefore means must be used to overcome the tendency of the sand to stick to the pattern. There are two ways of preventing this trouble: one is to dust a parting compound over the pattern, and the other is to heat the pattern.

If a parting compound is used, it must be applied frequently, at least for every second or third mould, which takes a certain amount of time; furthermore, it may be done carelessly, with the result that parts of the mould may not be covered, in which case imperfect moulds will result. Imperfect covering of the mould would be especially likely to happen in the case of intricate patterns, or patterns with surfaces nearly perpendicular to the plane of the mould, to which surfaces the compound might not readily adhere. Proper heating of the pattern, however, ensures that all parts are equally prepared to prevent the sticking of particles of sand, and eliminates the time required for applying the compound.

The gas flame and paraffin torch are frequently used for heating patterns, but electricity has been successfully used, and it is rather surprising that it has not been developed and employed more generally. Some years ago one large foundry adopted the following method: a steel-clad type of heater was used, and the electricity was obtained from an ordinary lamp socket through a flexible cord which was attached to the pattern carriage. In moderately cold weather the heat was used intermittently as the need for it arose, but in extremely cold weather the heat was applied continuously while the pattern was in use. The capacity of the heaters was 600 watts at 110 volts, and the temperature to which the patterns were heated was approximately from 32 to 37 deg. C.

Standard steel-clad heaters of the narrow type, which was in the form of a long flat strip, approximately 20 in. long, $1\frac{1}{8}$ in. wide, and $\frac{1}{2}$ in. thick, were laid in grooves cut in the face of a cast-iron plate which formed the top of the carriage. The heater terminals projected downward through holes drilled through this plate, and were wired to a plug socket on the side of the carriage. The upper surfaces of the heaters were perfectly flat and flush with the upper surface of the plate, so that when the pattern plate was laid on the top of the carriage, the heaters were in contact with it. With the pattern plate in place and fastened with suitable bolts and screws, the assembly was similar to the construction of a modern electric iron—the heating elements being firmly clamped between two metal plates so that the heat of the elements would be transmitted by conduction to the working surface. This enabled the heaters to operate at a relatively low temperature, and made the surface of the pattern quickly responsive to the application of the heat.

Some of the pattern carriages were equipped with electric heaters mounted in the space below the pattern plate, but not in contact with it, so that the heat was transmitted to the plate by radiation instead of conduction. This method was not so efficient in the utilisation of the heat, and resulted in a slightly greater power consumption and lower heating; but it was otherwise satisfactory. It is a cheaper method of installing the heaters, and in some cases it may be the most practical method.

The same type of electric heaters can be successfully used on a moulding machine. As in the case of the radiator patterns, the method of applying the heaters consists essentially in arranging and supporting them so that they will be in contact with the under side of the pattern plate below the thickest part of the pattern.

An Electric Welding Job.

Extensive repairs to the cast-iron casing of a generator which had been dropped and badly damaged.

By C. H. S. TUPHOLME.

AN interesting repair job has recently been carried out on the cast-iron casing of a 6,000-V generator which was inadvertently dropped from a height of 150 ft. whilst being transported across a river. The casing, which is ¾ in. thick, increasing to 2½ in. at the face where the end covers are bolted on, was broken and cracked in many places, as shown in fig. 1. To save the cost of a new housing, it was suggested that the generator might be repaired by electric welding, and this process was resorted to.

The welder found that the casing had sprung about 1/16 in. where it was cracked. He had all the cracks grooved out to a width of about 1 in. by ¼ in. deep, and then, utilising the bolt holes round the rim for fixing specially made clamps, pulled the casing back into its original position. The face of the groove on each side of the crack was spotted and built up until a V had been formed with the crack in the centre.

When the metal had cooled, the fractures were connected up with short runs, the whole job being completed without a single crack appearing in the welding. The clamps were then removed and the crack was welded up where it continued down the face of the rim. All the fractures were similarly treated, many broken pieces of the bottom of the casing having to be first fitted into position.

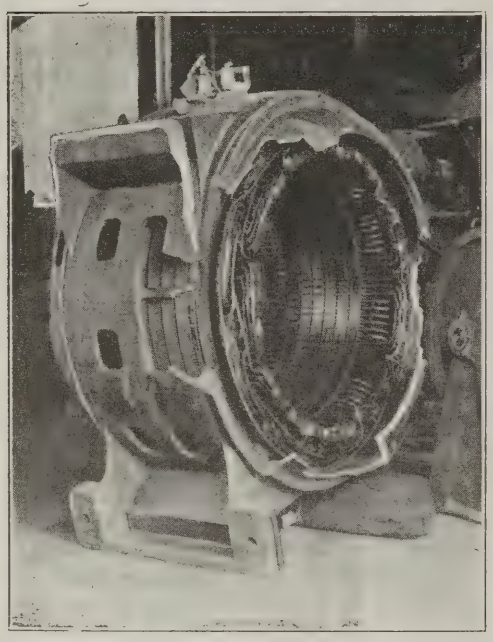

Fig. 1.—Damaged Generator.

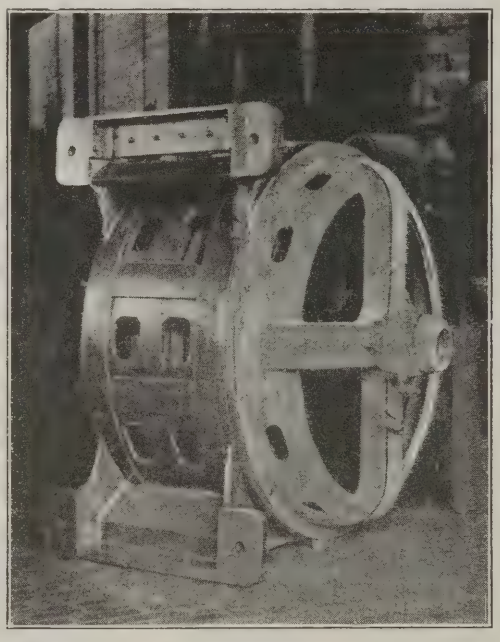

Fig. 2.—Repaired Machine.

Two of the feet had been broken off, and a large piece of the casting between them had fallen in the river and was lost. This repair was carried out by studding a piece of angle-iron, 6 in. by 6 in. by 1 in., to the casing, between the feet, and then welding it up. It was then studded to the legs and the whole welded together.

The job took 7½ days to complete and resulted in a thoroughly successful repair. Electric arc welding was adopted, and Quasi-arc electrodes, 360 ft. of No. 10 and 575 ft. of No. 12 cast-iron, and 300 ft. of No. 10 and 150 ft. of No. 12 mild-steel were used. The completed job is shown in fig. 2, and the generator has been in successful operation ever since the repairs were effected.

Hand-Operated or Automatic?

A consideration of the three principal types of motor control equipment with regard to the duties which they are required to perform.

By ROBERT MARSDEN, M.M.A.E.

THIS is a question with which every prospective purchaser of electrical equipment is confronted. No doubt the cost of automatic control gear prevents many from considering the countless advantages which it possesses if correctly applied.

Switchgear can be divided into three distinct classes:—1. Hand-operated; 2. Semi-automatic; and 3. Fully-automatic.

In the first class comes the simple starter familiar to most people, and generally fitted with a "hold-on" coil which allows the handle to return to the "off" position if the supply fails. Drum controllers are another form of the simple starter, but are arranged for hard wear and heavy duty. Between these two, on the direct-current side, comes the heavy-duty type, which is an ordinary starter built on more robust lines and generally incorporating a magnetic blow-out coil over the first starting contacts, with carbon tips to take any sparking that may arise during operation. Where "inching" is necessary, it is always advisable on either a heavy-duty type or drum controller of over 3 h.p. capacity to have a single-pole contactor to make and break the circuit; otherwise the ordinary contacts will soon be burnt and cause endless trouble. The plain starter is too well known to need its duty defining. If the motor is required to start against a heavy load, always use a heavy-duty type starter. For instance, in starting up a machine with a heavy flywheel, like a compressor or guillotine, the weighty flywheel will not speed up in about 7-10 seconds, which is the rating for ordinary starters of the smaller sizes. If one of these is used, the resistance will never stand the abnormal heating for long.

On the alternating-current side, if a high-torque squirrel-cage motor cannot be used, then the same applies to the rotor resistance of a slip-ring motor equipment. Where frequent operation is required, and the drum controller can be conveniently mounted, this makes quite a good job and is the best that can be given without resorting to automatic control in some way.

This, then, leads to the semi-automatic type of switchgear, which is at the present time undoubtedly becoming the most popular. This gear is arranged so that, by means of push buttons or a master switch, the motor can be inched, started, and stopped. If any speed variation is required, this is set by a hand-operated regulator, and once set, the motor always runs up to that speed when the start button is pressed. This type of control is largely used in the driving of printing machinery, paper-making plant, lathes, con-

veyors, &c., and should be installed wherever continual quick starting and stopping is required.

The final class is the fully automatic control, which is self-explanatory. Everything is automatic and can be operated by the usual remote-control devices. Lifts, hoists, rotary newspaper and magazine presses, big planer equipments, pumps that have to maintain a constant supply, automatic pressure plants, &c., all call for this type of control. Wherever anything big has to be driven, automatic control is essential, so that a man can keep his eyes on the machine and not endanger either himself or the plant by concentrating upon starting up and setting the running speed by hand.

A growing feature in connection with automatically controlled equipments is the application of dynamic braking. This is achieved by putting a resistance across the armature of the motor after the current has been cut off, and as the inertia of the machine being driven tends to keep the armature revolving, a current is generated. The less the ohmic value of this resistance, the greater the flow of current; the armature being thereby heavily loaded, it quickly comes to rest. This electrical braking is very powerful, and care should be exercised when testing out a new equipment. The resistance should be arranged with three or four tappings, so that a correct adjustment can be made. As this braking is purely automatic, it will be appreciated how valuable it is in saving time by stopping in a few seconds a machine which might otherwise run on for some considerable time.

Another important feature, well worth incorporating with a machine controlled by push-buttons or a master-switch, is an ammeter. This is often regarded as an unnecessary expense, but not infrequently it has proved the very thing that has prevented disaster. The current consumption of a motor, as shown by the ammeter, is a positive indication of the behaviour of the machine that is being driven.

It should always be borne in mind that it is false economy to use any but the best makes of automatic control gear, as invariably this type of control is used in conjunction with expensive machinery working on an output basis, and, with gear of inferior quality, breakdowns are almost inevitable and will cause serious delays and resultant losses.

Electrical Power Engineers' Association.

Annual Dinner of Northern Division.

THE eighth annual dinner of the Northern Division of the Electrical Power Engineers' Association was held at the Midland Hotel, Manchester, on March 26th, under the chairmanship of Mr. T. Riley, Burnley.

After the loyal toast, Lt.-Col. Sir Joseph Nall, M.P., proposed "Success to the Association," which, he said, represented an industry that had shown vast expansion and of which the highest hopes were entertained. They had now reached a settled stage in legislation, and, working on sound lines, the E.P.E.A. was assured of success.

Mr. A. W. Crompton, president of the Association, responded. He regarded the co-operation between the staffs of electricity supply stations and the manufacturing concerns as of the utmost value, and was glad that their scheme for the training of engineers was completed.

Mr. R. R. Telford, vice-president, proposed "The Electricity Supply Industry," and suggested that the publicly owned stations had done much to help the development of the manufacturing side of the industry. The electricity supply industry had shown that it was possible to pay high wages and obtain good results. In Sheffield in 1913 coal was 6s. per ton and the wages of firemen 25s. per week, and it was cheaper to run an inefficient steam engine than to obtain power from the public supply authority. But now coal was 30s. and firemen had £3; and it was found cheaper and better to depend on electricity. The tramway authorities were dependent on the electrical industry to maintain the fight against other means of transport; and tramways gave electrical engineers a very desirable load at times when the industrial demand slackened.

Response was made by Ald. W. Walker, M.I.E.E., member of the Central Electricity Board. He said that while other industries were depressed the electrical industry continued to prosper increasingly. Electricity had become fashionable among the women. Many undertakings were prospering because they had brought home to the housewife the advantages of electricity in the house and home.

Referring to the Central Electricity Board, Ald. Walker said it had not yet commenced to function. The members had just got to know each other. Parliament had been greatly concerned with electricity in 1919, 1922 and 1926; it should now leave electricity alone and let those in the industry get on with the job of producing energy for the community. Comparisons were frequently made with what had been done in other countries; but the conditions were often different, and were not comparable. The new Board would assist in the development of electricity supply and seek to give every part of the country which was ripe for the development a supply at a cost which would bring it within the economic possibilities of the industries within the area. It would not be possible to give an abundant supply to every district within a short number of years; but he believed it would be possible to bring about adequate supplies in many areas at an early date, and also an average reduction of price.

Professor B. Mouat Jones, principal of the Manchester College of Technology, in proposing "The National and District Joint Boards," commended the scheme of training which had been devised, but doubted the value of new examinations where such tests were already provided.

Response was made by Mr. W. J. H. Wood, borough electrical engineer, Bolton.

Mr. A. C. Wright, chairman, Manchester Section, proposed "The Ladies and Guests," replies to which were made by Mrs. H. C. Lamb, wife of the Manchester Electricity Department's manager and engineer, and Ald. J. W. Longley, Bradford.

Legal.

X-Rays, Ltd.

Mr. Justice Tomlin, in the Chancery Division on March 22nd, sanctioned the reduction of the capital of X-Rays, Ltd., from £75,000 to £24,265 2s., by reducing the £1 preference shares to 5s. each and the ordinary shares to 6d. each.

Mr. May, who appeared for the company, said the petition was adjourned from last December. His Lordship then said that the preference shareholders, whose rights were altered by the petition, did not appear to have had the opportunity of voting on the resolution for confirming the reduction of capital. These meetings had now been held and were unanimously in favour of the reduction. The company was formed in 1908 for the manufacture of all kinds of electrical apparatus, especially in connection with X-rays.

Southern Counties Electric Light and Power Supply, Ltd.

In the absence of any opposition, Mr. Justice Romer, in the Companies' Winding-up Court, on March 22nd, made an order for the compulsory liquidation of the affairs of the Southern Counties Electric Light and Power Supply, Ltd., on the petition of Mr. Percy Green and another, creditors.

Counsel for petitioners said the petition stood over so that the necessary affidavit verifying the petition could be sworn, but the gentleman who intended to do so had died. The affidavit had, however, been sworn by his representative.

His Lordship was informed that although the company did not oppose the petition, a director, the secretary, and the company's solicitor were actually in Court.

Wareham Electric Supply Co., Ltd.

The affairs of the Wareham Electric Supply Co., Ltd., were again before Mr. Justice Romer, in the Companies' Winding-up Court, on March 22nd, on the petition of a shareholder, Mr. William E. Weston, of Hounslow, that the company should be wound up compulsorily.

Mr. Wilfred Hunt, for the company, said the petition was first before the Court on February 2nd, and it had been standing over to enable the company to file evidence in answer to the petitioner's very long affidavit. Mr. Hunt said there was a charge of fraud. In view of the complicated nature of the matter and the mass of documents involved there had not been time to answer the petitioner's affidavit, and he asked for a further adjournment for fourteen days.

Mr. Galbraith, K.C., said he appeared for Mr. Edwards, who was the voluntary liquidator until that was put an end to in 1923, since when he had had nothing to do with the matter. But it was a case where, he thought, witnesses would have to be cross-examined.

Mr. R. J. Willis, for the petitioner, said he was anxious to have a full investigation, and he wanted to see the company's affidavit. He had been very careful to put into the petition only such things as could be proved by documents.

His Lordship, in granting the adjournment asked for, directed the attendance of witnesses for cross-examination if necessary, and said he hoped they would be able to dispose of the case at the next hearing.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The Easter Holidays.

We wish to draw our readers' attention to an announcement appearing in our Advertisement Supplement, stating that the issue of the Electrical Review for Friday, April 15th (Good Friday) will be published on the morning of Thursday, April 14th. All editorial and other matter intended for that issue should be sent in earlier than usual. New copy and blocks for advertisements must be received at 4, Ludgate Hill, E.C.4, by the morning of Wednesday, April 6th, but "Official Notices" and "smalls" can be received up to 5 p.m. on Monday, April 11th.

The E.D.A.-E.L.M.A. Campaign.

Rapid progress has been made during the past week or two and, according to the last official report, on March 26th there were 122 circles; 105 demonstration houses had been run; nearly 4,000,000 pieces of literature had been circulated; 1,501,000 competition booklets had been disposed of; and about 85,000 ballot papers had been received. At the present rate it was anticipated that the number of papers received would reach 100,000 before the close of the competition. So great has been the interest created by the demonstration houses that it is fairly certain that they will continue right into the summer. Builders and furnishers have proved most anxious to co-operate in the displays. A great demand for booklets is coming from schools as a result of a special effort made in that direction. During last week demonstration houses were opened at Bermondsey, Whitley Bay, and Malton. In the case of the first-named the average daily attendance has been about 800. Houses were to be opened this week at Heaton (Newcastle), Saltburn, and West Hartlepool. The last-named is the second to be opened in the town; the other was the first of the campaign demonstration houses.

Sir Harry Hatt, chairman of Bath Electricity Committee, speaking at a dinner of the Bath Electric Circle on March 24th, said that he hoped to see electricity within the reach of everybody at reasonable rates. He did not think that that would have been possible without the powers granted by the Electricity Act. He did not think that the Corporation would do much wiring itself, but even if it did the contractors would get the appliance business. The successes of the undertaking and the contractors were bound up together.

On March 25th a dinner was held by the Exeter and District Electric Circle. Mr. W. Brock, proposing the chief toast, said that the Exeter Electricity Committee, of which he was a member, was desirous of doing everything possible to assist the contractors and all in the electrical business. Although it was often urged that the Committee should do more advertising for business, the view taken was that this should be left to the contractors themselves. The Corporation had always laid down firmly the rule that it would do no trading. The chairman (Mr. H. D. Munro, city electrical engineer) said that the Circle's area extended from Dawlish to Exeter. There were great things ahead in the electrical world, and with the problems that would have to be solved in the near future, it was as well that electricians should discuss matters among themselves. Mr. L. G. Holt, responding to the toast of "The Manufacturers," visualised Exeter as a super station of the South or South-West. He stated that more persons entered the all-electric house in Exeter, promoted by the Circle, than in any town in the country.

The North-East Coast Area Circle recently organised a slogan competition for children. In view of the difficulty of judging, it was decided by the committee to divide the prize money into four prizes of £2 and six of 10s. After the slogans had been judged, it was discovered that the son and daughter of Mr. J. H. Parker, borough electrical engineer of West Hartlepool, had been awarded prizes. When acquainted with this fact they declined to accept the prizes, and requested that the money should be divided among the other four winners, making their prizes 15s. The slogans showed great merit.

An all-electric house arranged by the Southern East Anglia Circle was opened at Ipswich on March 19th. Every room of this dwelling is electrically equipped in a very thorough manner, the furnishing and decoration having been carried out by a local firm. At night the building is floodlighted. The members of the local Circle are the Corporation Electricity Department, the East Anglian Electric Supply Co., Ltd., Colchester Corporation, Bury St. Edmunds Corporation, the Orford Electric Light & Power Co., Ltd., the General Electric Co., Ltd., Caliender's Cable and Construction Co., Ltd., Metro-Vick Supplies, Ltd., and the following contractors:—Wood & Co. (Ipswich), Mann, Egerton & Co., Ltd. (Ipswich), Bullard & Co. (Ipswich), A. W. Fisher (Ipswich), C. C. Pudney & Co. (Bury St. Edmunds), R. J. Bates & Co. (Bury St. Edmunds), and H. G. Tumilty (Dovercourt).

The E.D.A. Report.

There are a number of interesting points in the report of the British Electrical Development Association for 1926, to which brief reference was made in our last issue. The summary of membership includes 278 electricity supply undertakings (150 municipal, 14 London companies, 14 power companies, 96 provincial companies, and 4 Colonial undertakings); there are also 234 manufacturers, 1,155 contractors (including Scottish members) and 70 wholesalers, making a grand total of 1,737, showing an increase of 116 during the year. The revenue was received from the various classes in the following proportions:—Supply undertakings, 56.5 per cent.; manufacturers, 41.4 per cent.; contractors, 1.8 per cent.; and wholesalers, 0.3 per cent. The analysis of expenditure shows that a very good proportion of the funds was spent in actual propaganda work. The administrative expenses (including 12 per cent. for salaries, wages, and emoluments for special services) only absorbed 18 per cent. of the total. The largest item was "advertising towards the public, display publicity, and general Press work"—60 per cent., but the remaining 22 per cent. was also mainly spent in various publicity channels. The films owned by the Association now number 12, the latest being a 900-ft. film dealing with electricity's contribution to smoke abatement. The sales of literature during the year brought in £7,218, an increase of 130 per cent. over 1925; this, of course, included campaign literature. Other matters dealt with in the report are the Association's relations with other bodies, including the Electrical Association of Women; the Campaign; the Ideal Home Exhibition; the Electric Vehicle Committee, &c.

The Manufacturers' Agents' Association.

The council and annual general meetings of the Manufacturers' Agents' Association of Great Britain and Ireland were held on March 8th. Mr. H. Gledhill, of Messrs. Haes, Gledhill & Co., the chairman of the London Council, presided, and spoke at some length on the progress of the Association and its increasing usefulness since its inception in 1909, when from a mere handful its number has reached well over 1,000. The following councillors were re-elected for the ensuing year: Messrs. Gledhill (chairman), W. Poole (hon. secretary), A. W. Chastel (hon. treasurer), F. Martin (London hon. solicitor), L. Hazell, A. G. Leach, S. Artaud, L. Hudson, S. Boys, W. R. Stone, E. E. Taylor, J. N. Steele. There being one or two vacancies on the Council, members who were willing to give their services and attend one meeting a month were asked to send in their names to the secretary. Mr. J. Joy was asked to succeed Mr. J. H. Snow as president.

The British Industries Fair, 1926.

The recently-published official figures show that the loss on the London Section of the 1926 British Industries Fair was only £2,089. This is considered satisfactory, especially having regard to the fact that the Fair is not run for profit-making.

New Italian Companies.

Among the concerns recently organised in connection with the electrical industry in Italy are the Società Illuminazione Elettrica Vetture, Milan, capital 60,000 lire; La Società "Isola" per la Fabbricazione di Isolanti Elettrici, Milan, capital 50,000 lire; La Società Industria Apparechi Termo-Elettro Sanitari, Milan, capital 30,000 lire; La Società "Adma" per Costruzione e Commercia di Apparechi Elettrici e di Usa Domestico, of Genoa, capital 10,000 lire; and La Società Industrie Meccaniche ed Elettrotechnici, Milan, capital 20,000 lire.

Public Service Salesmanship.

In a recent article upon "Salesmanship in Public Utility Undertakings," Mr. F. W. Goodenough, C.B.E., chairman of the Incorporated Sales Managers' Association, says that the idea still prevails that the provision of tramways, electricity, gas, and other public services, is different from selling food, clothing, &c. It is, however, as essential for the providers of such services, whether monopolists or not, to advertise as it is for the ordinary manufacturer and supplier. Moreover, good salesmen are required, and it is the duty of public utilities to adopt progressive business methods. The bestowal of the sole right to perform a certain service in an area carries with it an obligation to serve all the members of the community within that area in the best possible way. If the service is not advertised it is not used as much as it might be. Consequently the standing charges are higher in proportion to the turnover, which leads to a higher price than is necessary. Employés of public utility undertakings should be taught to be salesmen, not officials. The confidence of the public should be fostered, and complaints should be treated as opportunities for the exercise of tact, sympathy and understanding, and not as nuisances. The golden road to true success is "service."

Ball-Room Lighting.

A scheme of ball-room lighting which has recently been installed at the Majestic Hotel, St. Annes-on-Sea, is very attractive and novel. It aims at portraying the daily journey of the sun across the heavens (*pace* Galileo). Suspended from the domed and frescoed ceiling are six "G.E.C." hexagonal pendants in gilt-colour metal work with silver-plated sprigs carrying crystal drops and 36-in. marble-tinted vellum parchment bowls, each containing six orange, twelve blue, and nine

The Ballroom of the Majestic Hotel, St. Annes.

red, 60-W "Osram" colour-sprayed gasfilled lamps, each colour being wired on a separate circuit, with one 300-W white lamp in the centre. As a dance begins, the light dims to the cold pallid hue of early dawn, then slowly, scarcely perceptibly, there is a brightening which displaces the chill atmosphere and soon floods the hall with brilliant noonday sunshine. Then another change takes place, and gradually the light fades slowly to the crimson glow of sunset. The cycle is then repeated. These effects are obtained by the use of a three-way dimming device which can either be used mechanically to provide a succession of changing and intermingling colours, or locked in position to give any set colour. The fittings were specially designed by the Fittings and Fixtures Department of the General Electric Co., Ltd., to the instructions of their Manchester branch. The electrical contractors were Messrs. G. Wilkinson (Arnside), Ltd.

British Trade Exhibition at Melbourne.

The date of opening of the British Trade Exhibition at Melbourne has been fixed for February 23rd, 1928; it will be open for six weeks. The exhibition will be confined to goods made in the British Isles (not the Empire).

The Future of the Engineering Industry.

Speaking as chairman at the recent annual meeting of Cammell, Laird & Co., Ltd., Mr. W. L. Hichens said he was not one of those who thought that all we had to do was to sit still and wait for orders which were to come in abundance. The crop would not be a heavy one, and we would not secure our proper share unless we made special efforts to do so. The situation was certainly better—mainly owing to the accumulation of orders during the past year—but foreign and domestic competition was very keen, and in some branches prices were considerably cut. We could not compete on price in certain directions without a concerted effort to reduce costs all round. He was convinced that that could be done, and done without lowering the standard of living in this country. The worst possible way of meeting our industrial problems was with easy-going optimism which imagined that trade was going to improve automatically.

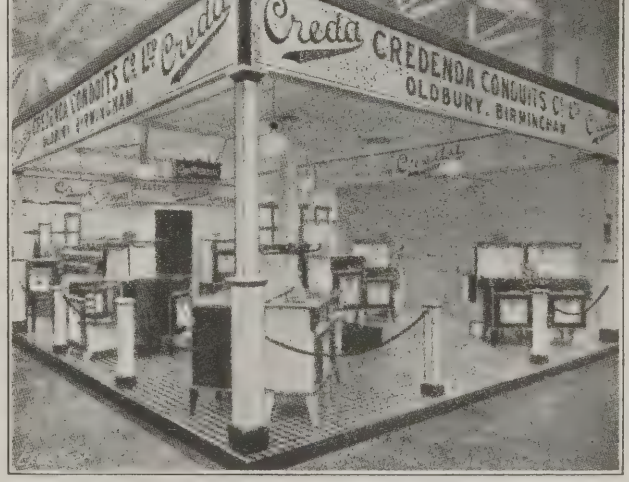
Lighting a Book Factory.

The lighting of the works illustrated herewith was carried out by means of "Siemens" equipment. The main building of the Greycaine Book Manufacturing Co., Ltd., Watford, has a length of 625 ft., and is 108 ft. wide. The installation consists of 60 "R.L.M." reflectors correctly spaced along each of the bays. "Siemens" gasfilled lamps are used with the

Lighting at a Large Book Factory.

reflectors, and well-distributed illumination of high value is obtained. We are informed that the company (which specialises in very cheap editions) turns out about 60,000 books a day. Twenty tons of paper enters one end of the building daily, and emerges at the other end in the form of books.

Swedish Electrical Exports.



The *Swedish Economic Review* (the organ of the Swedish Board of Trade) states that during 1926 the exports of electrical machines were valued at 27,360,000 kr. (£1,500,000), as compared with 21,026,000 kr. (£1,155,000) in 1925. At the same time the exports of telephone and telegraph apparatus rose from 7,010,000 kr. (£385,000) to 7,437,000 kr. (£400,000).

Anglo-German Industrial Discussions.

The Times, recalling the conference between German and English industrialists, in October last, says that the German representatives are anxious that the discussions should be resumed, and Mr. P. J. Hannon, M.P., one of the hon. secretaries of the movement, has been requested to extend an invitation to all the British delegates at the Broadlands conference to be the guests of Dr. Duisberg, the chairman of the Federation of German Industry, at his chateau at Leberkusen, near Cologne. The period suggested for the conference is April 29th to May 2nd.

Credenda Apparatus at Birmingham.

The Credenda Conduits Co., Ltd., has sent us a view of its stand at this year's British Industries Fair, Birmingham; this is reproduced herewith. The company's display consisted

The Credenda Stand at Birmingham.

of a wide range of domestic appliances, prominent among which was a new design of cooker. Conduits and conduit fittings were also represented, of course.

Austrian Cable Sales Combine.

Nine of the principal electric cable and wire manufacturing concerns in Austria have decided to organise a joint sales office in that city under the style of the Verkaufsgesellschaft für Isolierte Leitungen.

Wages in the Engineering Industry.

A meeting of delegates of the engineering trade unions was held in London last week to consider the resumption of negotiations for a general advance in wages. It was reported that the demand of the London District Committee for an increase of 3d. per hour had been withdrawn on the previous day in view of the proposed national negotiations. A resolution was passed empowering the chairman (Mr. J. T. Brownlie) and the secretary to communicate with the Engineering and Allied Employers' Federation with a view to arranging a conference upon the subject. It is stated that the Federation will be asked to submit an unconditional offer which will form the basis of discussions.

Australian Electrical Imports.

The imports of electrical machinery into Australia during December last attained a value of £617,000, as compared with £562,000 in the corresponding month of 1925.

Social Events.

The recently-formed dramatic section of the Magnet Operatic and Dramatic Society (General Electric Co., Ltd.) gave its first performance on March 25th at the headquarters of the Magnet Social Club, Erdington, Birmingham. Three short plays were presented—"The Marrying of William," "13, Simon Street," and "Postal Orders," in each of which a gratifying degree of ability was revealed.

The Greater London Division of the Electricity Supply Commercial Association held a dance on Saturday last, at the Poland Rehearsal Rooms, Poland Street, W.1. The attendance did not come up to expectations, but those who were present spent an enjoyable evening, for which the Sylvonia Dance Band was largely responsible. Mr. S. W. Turner, divisional secretary, and those who assisted him in arranging the event were deserving of much better support.

Some 160 members of the Liverpool and London staffs of the Automatic Telephone Manufacturing Co., Ltd., attended the fourth annual dinner which was held on March 18th, at the Exchange Hotel, Liverpool. In proposing the toast of "The Company," Mr. D. Sinclair, who presided, made some interesting references to the very early days of telephony. Sir Max Muspratt, Bt., also spoke. The dinner was followed by a musical programme.

The "Clesco" (County of London Electric Supply Co., Ltd.) Light Operatic and Dramatic Club staged "Highwayman Love," a musical play, at King George's Hall, W.C., on March 17th, 18th, and 19th. The work, which contains many tuneful airs, gave considerable scope to the principals. The chorus and Kneller Hall Orchestra, under the leadership of Mr. Arthur B. Meadows, were in splendid form. Mr. Walter E. Dossett was responsible for the production. Though the whole performance was an example of excellent team work, special mention must be made of Mrs. Lillian Sanders (Isabel, the gipsy girl), and Mr. George Mortlock (Denis O'Neill, the highwayman).

Shockproof Automobile Lamps.

Messrs. Philips Lamps, Ltd., have sent us a photograph of the results of a motor accident caused by a motor-cycle combination colliding "head on" with a motor-car. Although the headlamps of the car were completely smashed, it was found, upon test, that terrific as the impact had been, the two lamps (Philips' automobile type) were perfectly serviceable, even the delicate filaments having stood the shock.

New Chilean Company.

La Sociedad Manufacturera Electrica Curtze, Jara & Cia., Ltda., is the name of a concern which has lately been formed in Santiago, Chile, to manufacture electrical apparatus.

Trade Announcements.

Messrs. E. & W. Shepherdson, electrical engineers, of Morecambe, have transferred their business to 59, Euston Road.

The Automatic Coil Winder and Electrical Equipment Co., Ltd., is moving into larger premises, and its address after April 9th will be:—"Winder House," Rochester Row, S.W.1. The company is installing special plant for the repair of transformers, loud speakers, headphones, &c.

The Brundall & District Service Co., Ltd., informs us that it has just purchased from the Receiver the electrical contracting business of Messrs. E. & C. Gates, Ltd., Arcade Street, Norwich. It proposes, after re-organising, to carry on the business, specialising in country house lighting installations.

Graham Amplion, Ltd., has appointed Automobile Accessories, Ltd., 93-95, Victoria Street, Bristol, its West of England representatives for the "Graham Amplion" public speech and band repeater equipment. Tours by equipped vans are shortly being commenced.

Messrs. Priestley & Ford, Birmingham, are entering the wholesale electrical trade, and their premises at 3, Carrs Lane, are being considerably enlarged for this purpose. They will comprise eventually three floors with extensive storage accommodation, offices, and demonstration rooms.

Messrs. A. Hugh Seabrook & Partners, 146, Bishopsgate, E.C.2, state that they will be glad to hear from electrical manufacturers and contractors who specialise in the electrical equipment of hoists, cranes, drills, &c., in connection with quarries.

The registered offices of the Empson Electrical Engineering Co., Ltd., have been transferred from Victoria Street to 27, Chancery Lane, W.C.2. ('Phone: "Holborn 2344.")

The Regent Cycle Stores, which has a wireless goods department, has removed to 33, Henblas Street, Wrexham.

Messrs. Allens, electrical engineers, of 40, High Street, Watford, have opened showrooms for electrical fittings and wireless sets.

Mr. B. Swaffield, electrical engineer, of Bedford, has removed his business from Queen Street to Lurke Street.

Messrs. Beasleys, Ltd., electrical and radio engineers, opened premises at 174, Mortimer Street, Herne Bay, on March 30th.

Messrs. John Harvey & Son, electrical contractors, of Kimberley Road, Cambridge, are opening an office and showroom at 1, Wheeler Street, Cambridge.

New Catalogues and Lists.

The Marconiphone, Ltd., 210-212, Tottenham Court Road, W.1.—A coloured poster advertising the company's h.t. supply unit for receiving sets, and a leaflet illustrating a handsome window display for "Marconi" valves.

Messrs. Allen-Liversidge, Ltd., Victoria Station House, Westminster, S.W.1.—An illustrated brochure dealing with the applications of acetylene and electric welding to the repair of road transport vehicles.

The Hart Accumulator Co., Ltd., Marshgate Lane, Stratford, E.15.—A large coloured poster (5 ft. by 3 ft. 6 in.) advertising "Hart" batteries for automobile starting and lighting.

The Sun Electrical Co., Ltd., 118-120, Charing Cross Road, W.C.2.—List No. 470, containing illustrations and prices of "Sunnix" dustproof lighting fittings; and an illustrated folder dealing with "A.B.C." electric washing machines, "Sunshine" vacuum cleaners, and Johnson's electric floor polisher.

The Vincent Switchgear Manufacturing Co., Ltd., Sampson Road North, Birmingham.—A pamphlet containing illustrated particulars and prices of "Vincent" circuit dividing fuses.

Mr. J. E. Stott, 15, Clare Hill, Huddersfield.—Illustrated leaflets dealing with the "S-An-S" electric wash boiler, and electric lamps.

Pope's Electric Lamp Co., Ltd., 5, Arthur Street, New Oxford Street, W.C.2.—A leaflet advertising "Pearl Elasta" (internally-frosted) gasfilled lamps.

Messrs. F. T. Murdoch & Co., Ltd., Thompson Street Works, Belfast.—Three illustrated leaflets advertising the company's hoisting and stacking equipment.

Berry's Electric, Ltd., 85-86, Newman Street, Oxford Street, W.1.—A priced and illustrated pamphlet describing the company's new "Hous" switchfuse.

The British Thomson-Houston Co., Ltd., Crown House, Aldwych, W.C.2.—An illustrated booklet telling "The Story of 'Mazda' Electric Lamps," which was distributed at the Ideal Home Exhibition.

Factum, Ltd., 17, Soho Square, W.1.—Price lists of electric lamps, clear, opal, and coloured.

Higgs Motors, Witton, Birmingham.—March-April stock list of a.c. and d.c. motors.

Messrs. Herbert Morris, Ltd., Loughborough.—An illustrated booklet (No. 110) dealing with battery trucks, stackers, &c.

Sky Printers, 20, Church Road, Seaforth, Liverpool.—A pamphlet describing a novel method of "sky writing."

Messrs. E. J. & J. Pearson, Ltd., Firebrick Works, Stourbridge.—A comprehensive catalogue (95 pp.) of the company's fireclay products. The works are described, examples of the company's work are illustrated, and, in addition, a great deal of useful data is included.

Radio Communication Co., Ltd., 34-35, Norfolk Street, Strand, W.C.2.—List B/127—an illustrated description of the company's ½-kW transmitter, &c., for marine communication.

Electrical Utilities, Ltd., Tudor Works, Park Royal, N.W.10.—A priced and illustrated folder dealing with the "Utility" electric radiator fitted with "Globar" elements.

Radio Instruments, Ltd., 12, Hyde Street, New Oxford Street, W.C.1.—An illustrated folder fully describing the "R.I." h.t. supply unit for a.c. mains. Priced. Particulars are also given of the components necessary for the building of battery eliminators for a.c. and d.c. circuits.

Messrs. W. B. Trew & Son, Kingsbury Works, Kingsbury, N.W.9.—An illustrated pamphlet advertising "Tru-Ray" high-frequency electro-medical apparatus. Priced.

Bankruptcy Proceedings.

R. P. Reeves, trading as the Luxray Spotlight Projector Co., late of 5, Says Corner, North Quay, Great Yarmouth, electrician.—The adjourned public examination of this debtor was held on March 23rd, at the Town Hall, Great Yarmouth. The statement of affairs showed liabilities of £1,041 and a deficiency of £954. The debtor had previously failed to attend for his public examination on two occasions. He said that he went to Reading for a year to learn engineering, and returned to Yarmouth in 1919 and obtained a position with a firm of engineers. Then he became an apprentice for five years ending 1925. He invented and patented a projector to throw a concentrated beam of light from a small power lamp. He commenced to trade, and received a contract from

a hospital for £30. His profit on that contract was about £16, and he sold lamps for various companies. He admitted that he owed £100 when he commenced business. Last August he purchased the premises and spent £200 on alterations and an electrical installation, and £40 on office furniture. He employed a traveller as he hoped to find customers in large cities. He had sustained a net loss of £386. The examination was closed.

C. P. Moody (trading as the South-Eastern Manufacturing Co.), Crown Works, Finck Street, Lambeth.—The first meeting of creditors was held on March 21st, at the London Bankruptcy Court. The debtor, who filed his petition on March 7th, states that in March, 1920, he commenced business as a maker of Leclanché batteries. Owing to lack of capital the business fell away, and he endeavoured to secure agencies for other goods. He estimated his liabilities at £800, against assets £67, and in the absence of any resolution the case was left in the hands of the Official Receiver. The cause of the failure was said to be keen competition.

E. W. Kirk, lately trading as the Ace Radio Manufacturing Co., 26, Curzon Street, Derby.—The public examination of this debtor was held on March 22nd, at the Court House, Derby. The statement of affairs showed liabilities of £270, against assets of £16. Debtor stated that his radio business was never really successful, and eventually he sold a patent for a radio coil to a London firm for £75. The coal dispute seriously injured his business, and he closed down. He was now in employment, and offered £2 a week towards his debts. The examination was closed.

S. A. Wardell, electrical engineer, 83, Raleigh Road, Richmond, Surrey.—Trustee, Mr. T. Gourlay, Official Receiver, 29, Russell Square, W.C., released March 15th.

C. W. Watson, electrical and wireless engineer, 33, Rainhall Road, Barnoldswick, Yorkshire.—First and final dividend of 1s. 0½d. in the £, payable March 25th, at the Official Receiver's offices, 12, Duke Street, Bradford.

E. Temple and Mrs. J. E. Burkett (Westoe Electrical Co.), wireless dealers and electrical contractors, 105, Canterbury Street, South Shields.—Receiving order made March 21st, on debtors' own petition.

S. H. Bardwell (Bennett, Bardwell & Co.), electrical engineer, 22, Church Street, Basingstoke.—Trustee, Mr. H. Ashton, Official Receiver, Midland Bank Chambers, High Street, Southampton, released March 16th.

J. E. W. Archer, watchmaker and wireless dealer, 259, Crookes, Sheffield.—First and final dividend of 1s. 8½d. in the £, payable at the Official Receiver's office, 14, Fig Tree Lane, Sheffield.

T. F. Collier, electrician, 116, Union Street West, Oldham.—First meeting, April 1st, at the Official Receiver's offices, Byrom Street, Manchester. Public examination, April 13th, at the Court House, Oldham.

F. C. Goss, electrical engineer, 32, Windsor Road, St. Andrew's Park, Bishopston, Bristol.—Application for discharge to be heard April 29th, at the Guildhall, Bristol.

S. Purcell, electrical contractor, The Arcade, Goole, Yorks.—Trustee, Mr. B. S. Briggs, Official Receiver, 21, King Street, Wakefield, released March 16th.

Company Liquidations.

Louis Samuel, Ltd., wireless dealers, late 54, Gracechurch Street, E.C.—A meeting of creditors was held on March 22nd, at the Institute of Chartered Accountants, E.C. The chair was occupied by Mr. W. F. Baker, 97, Mortimer Street, W., who had been appointed to act as the liquidator in the voluntary liquidation of the company. The statement of affairs presented showed liabilities of £1,456, of which £989 was due to the trade and £466 to Mr. Samuel. The assets were estimated to realise £220 (net). The company was registered on December 6th last, with a nominal capital of £500, but only two signatory shares of £1 each had been issued. The company took over the business which had previously been carried on by Mr. Samuel. Some creditors had stated that they did not recognise the company, but were looking to the vendor. That might reduce the liabilities to the trade, but it would increase the claim which Mr. Samuel would have against the company. Mr. Baker said that there was no actual agreement with Mr. Samuel, but the goods for which creditors were claiming passed to the company, and Mr. Samuel would have a claim against the company for their value. Since the company had been formed the sales had been £979, whilst the purchases had amounted to £621, and after allowing for all the expenses there was a net loss of £542. Towards the end of February a creditor levied execution, whilst the company was also threatened by the landlord. Mr. A. Samuel, the father of the active director, agreed to lend £100 to the company on the security of a debenture. Mr. Baker said that when he was consulted he advised that it was impossible for the business to be continued. A creditor inquired who "Smarts" of Gracechurch Street were, and Mr. Baker replied that that was the original name adopted for the business, and he understood that the goods had been ordered in that name, but were paid for by Louis Samuel, Ltd. Another creditor asked if there was any connection between the company, and a firm known as "Hamilton"; Mr. Baker said there was not, but he understood that Mr. Samuel started the business by buying certain stock from the liquidator of "Hamiltons." A resolution was passed confirming the voluntary liquidation of the company with Mr. Baker as liquidator, and an advisory committee was also appointed, consisting of the representatives of the Radioland Co., Ltd., Houghton-Butcher, Ltd., and V. Zeitlin and Son. The following are creditors: —

	£		£
East London Rubber Co.	20	Radioland Co., Ltd. ...	166
Ewart Evans, Ltd. ...	90	Reynolds, W. H. (1923), Ltd.	21
Grimshaw, Baxter, and J. J. Elliott	40	S.D.H. Manufacturing Co., Ltd.	31
Houghton-Butcher, Ltd.	104	Scientific Glassware Co.	48
Lever, Eric J.	75	S-T., Ltd.	21
Melbourne Radio Supply	26	Samuel, Louis	466
Mullard Wireless Service Co., Ltd.	22	Wells, Joseph, & Son, Ltd.	47
Radio Communication Co., Ltd.	20	Zeitlin, V., & Son ...	76

John Bell & Croyden, Ltd.—A resolution for the voluntary liquidation of this company was passed at a meeting of creditors last week. The liabilities were stated to be £59,193 and the net assets £34,181, leaving a deficiency of £25,011 so far as the creditors were concerned. The original authorised capital of the company, £150,000, was increased to £175,000, and subsequently reduced to £42,750. Arrangements had been made to sell the business, but it was reported that the proceeds of the sale would not be sufficient to discharge the claim of the first debenture holder. Messrs. P. S. Booth and H. Hackett were appointed joint liquidators with a committee of inspection.

Aster Engineering Co. (1913), Ltd.—Winding up voluntarily. Liquidator, Mr. S. D. Begbie, of Wembley, with powers to enter into an agreement with Arrol-Johnston, Ltd., on terms arranged, and to dispose of the selling rights of the Aster cars to a new company. Meeting of creditors, April 6th, at 50, Gresham Street, E.C. Particulars of claims to the Liquidator by April 30th.

Carpax Co., Ltd.—Particulars of claims by May 3rd to the Liquidator, Mr. J. Wilson, 2, St. James Square, Manchester.

Southern Counties Electric Light and Power Supply, Ltd.—Winding up order made by the High Court, March 22nd.

New Municipal Showrooms.

The accompanying picture is a view of the new showrooms recently opened by Accrington Electricity Department in Whalley Road. Before proceeding with the work the Corporation made an extensive investigation into the schemes carried out by other municipal electricity supply authorities, and the result is the embodiment of all that is up-to-date in the

The New Accrington Showrooms.

design of the premises. As will be seen the showrooms have an extensive window frontage permitting of uncrowded and distinctive displays. It is reported that the new premises have already had a beneficial effect upon the sale and hire of electrical apparatus in Accrington.

Proposed Austrian Tariff Changes.

A number of alterations proposed in certain Austrian Customs duties are set out in the *Board of Trade Journal* dated March 24th. Among the commodities affected are pipes and tubes the duties upon which are, in most cases, to be raised. The duties upon "shaped parts of glass or other insulating material (except hardened rubber or porcelain) for electrical purposes, not equipped, weighing less than 600 gr. each" are increased from 19 and 25 gold kr. per 100 kg. to 140 kr.

A Novel Fire Escape.

Messrs. Merryweather & Sons, Ltd., have recently supplied to the Leicester Corporation a new type of turntable fire escape with which is combined a fire pump. The appliance possesses several novel features, among which are a searchlight and a telephone for communicating from the ground with a fireman at the top of the 85-ft. ladder.

D

The Free State Radio Apparatus Duty.

A joint committee representative of the Wireless Retailers' Association of Ireland, the Wireless Society of Ireland, and a number of firms engaged in the radio apparatus trade in the Irish Free State is urging upon the Free State Minister of Finance the abolition of the 33⅓ per cent. *ad valorem* duty upon imported radio sets. It is stated that incalculable harm is being done to the industry by this duty, and if it were remitted the number of licence holders would rapidly rise from the present figure of 30,000 to about 100,000.

For Sale.

Southampton Electricity Department has for disposal a 38-ton per hour disused gravity bucket conveyor, complete with motor, &c.; Dartmouth Corporation invites offers for two 48-h.p., 480-V, d.c. motors, with spares. Mr. H. J. Shaw will sell by auction on April 7th, at 13, High Holborn, W.C., various trade stocks of wireless and electrical goods, &c.; Blackpool Co-operative Society invites offers for surplus electrical plant. (See our advertisement pages to-day.)

Book Notices.

Publications of the Association of Engineering and Shipbuilding Draughtsmen.—"The Craft of Tracing."—A short exposition of what may be considered the accepted methods of tracing; prepared by the National Technical Sub-Committee of the Association Executive. "E.h.t. Switchgear and Breakers." By G. L. E. Metz.—A pamphlet presenting valuable data on the design, primarily of oil circuit breakers, but also in a lesser degree of air circuit breakers, which have been collected. The general duties and the various working conditions and characteristics of the breaker are defined as well as the machine conditions under which it has to operate. The calculation of the rupturing capacity and considerations of the stresses to which the breaker is subjected are features of the work. Copies of each of the above may be obtained from the Association secretary, price 2s. each.

"Municipal Year Book, 1927." Pp. lxxix+900. London: Municipal Journal, Ltd. Price 15s. net.—In the new edition of this year book, several improvements have been introduced; the introductory matter relating to the various towns has been revised, extended, and brought up to date, the rural districts section has been considerably improved and added to, and the names and addresses as well as the principal officials of the various municipal authorities in Northern Ireland and the Irish Free State, are included; hitherto information relating to the six principal cities only has been given. As in previous years, the financial results during the year 1925-26 of electricity, tramway, railless traction, and other undertakings are given, as well as the legislation under which these undertakings have been established and are operated.

"Southampton Docks, 1927" (pp. xliv+147). London: The Southern Railway Co.—This brochure contains very full information regarding the facilities available at the Southampton Docks and sets out the charges for the handling and storage of goods, &c.

A list of "5,000 practical books" has been received from the Popular Mechanics Press, 635, St. Clair Street, Chicago, U.S.A.

"Scientific Papers of the U.S.A. Bureau of Standards." Vol. 21, No. 537, Formula for the inductance of a helix made with wire of any section. (25 cents.) Vol. 21, No. 542, Electric field of a charged wire and a slotted cylindrical conductor. (10 cents.)

"Circular of the U.S.A. Bureau of Standards." No. 17. Magnetic Testing. (15 cents.)—This circular contains a brief discussion on magnetic quantities and characteristics of materials, and outlines the various methods used by the Bureau for the magnetic testing of commercial materials.

"Science Abstracts (A and B)." Vol. XXX. Part 3. March 25th, 1927. London: E. & F. N. Spon, Ltd. Price 3s. each net.

Canary Islands Trade.

In a recent report on the Canary Islands (Department of Overseas Trade: Stationery Office, 1s. net.) Mr. P. Helyar, British Consul at Teneriffe, shows that 39 tons of electrical material was imported during 1925. The origins of this were as follows:—Germany, 19 tons; Spain, 6 tons; France, 5 tons; Belgium, 5 tons; United Kingdom, 4 tons. The total amount of telephone material imported was 78 tons, which came from the following sources:—Norway, 36 tons; Belgium, 22 tons; Holland, 17 tons; Germany, 3 tons.

Electric Power in Industry.

Continuing its series of supplements dealing with the Census of Production, the *Board of Trade Journal* for March 24th contains particulars relating to further branches of industry. In connection with the motor and cycle trades it is shown that in 1924 they had, collectively, generating plant of a capacity of 25,010 kW installed, as against 2,225 kW in 1907. The aggregate power of electric motors installed was 171,696 h.p.; power for 142,101 h.p. was purchased. In the seed-crushing industry the generating plant had a capacity of 15,625 kW (against 1,096 kW in 1907). The aggregate power of the industry's electric motors was 40,964 h.p. (energy purchased for 22,987 h.p.).

The soap and candle trades' generating plant rose from 3,837 kW in 1907 to 18,396 kW in 1924. Although the installed electric motors had an aggregate power of only 19,965 h.p., energy for 9,855 h.p. of these was purchased.

The Canadian Power Industry.

In a review of the expansion of the electric light and power industry in Canada, the Royal Bank of Canada states that the industry now ranks first among Canadian manufacturing industries in terms of capitalisation, with an aggregate amounting to more than $700,000,000, and sixth among the industries in terms of annual gross income, this amounting to well over $100,000,000 a year. As the present installation represents the development of only 10 per cent. of the recorded waterpower, the Waterpower and Reclamation Service has estimated that during the next 20 years the expenditure for new installations will exceed one billion dollars.

The Contractors' Convention.

We have received the provisional programme of the second annual conference of the E.C.A. Allied Associations, which is to be held at Scarborough from June 22nd to 25th inclusive. The first day is to be devoted to a council meeting and a reception by the president (Mr. H. J. Miles). The annual general meeting is to be held on the 23rd at Olympia (Scarborough). After an address of welcome by the Mayor, Mr. Miles will deliver his presidential address, and in the afternoon a paper on "Some Interesting Points on Modern Installation Work" will be read by Mr. R. Grierson (Grierson, Ltd.). A smoking concert will be held at the Grand Hotel in the evening. On the following day (Friday, June 24th), Mr. J. Kirkham (Rawlings Bros., Ltd.) will read a paper on "Estimating and Costing for Electrical Contractors," followed by Mr. H. E. Walker (Walker Bros., Birmingham), whose subject will be "The Electrical Showroom as a Commercial Proposition and its Relation to the Industry." The business proceedings will terminate with a short address by the new president. Friday afternoon and Saturday will be occupied by social functions, excursions, &c.

A folder is being issued giving particulars of accommodation available, registration forms, &c. The conference fee will be the same as last year, *viz.*, 25s., plus 7s. 6d. hotel deposit which will be deducted from the hotel bill. All applications to attend the conference should be addressed to the General Secretary, Mr. L. C. Penwill, 15, Savoy Street, Strand, W.C.2.

Local Exhibition.

BLACKBURN.—At an exhibition in the Public Hall, Blackburn, which was opened on March 29th, by Dr. J. Ramsay, deputy mayor, there was an excellent display of electrical appliances and labour-saving devices. The stand of the British Electric Polisher, Ltd., attracted considerable attention.

Recent Contracts.

MESSRS. RICHARD GARRETT & SONS, LTD., have recently received an order from the Società Imprese Elettriche dell America Latina for six Continental-type low-loading electric trolley-'buses for service in Lima, Peru, by the Lima Light, Power & Tramways Co. A fleet of five Garrett trolley-'buses has recently been supplied to the Nordsjaellands Elektricitets og Sporvejs Aktieselskab, of Kellerup, near Copenhagen. The vehicles are of the latest low-loading type, fitted with standard "Bull" motors and "Garrett" drum-type controllers. These are the first electric trolley-'buses to be put into service in Denmark.

INTERNATIONAL COMBUSTION, LTD., has received a repeat order from the Derby Corporation Electricity Department for an 80,000-lb. boiler complete with drying equipment, "Lopulco" water-cooled combustion chamber, superheaters, economisers, draught equipment, dust-catching apparatus, and stacks. It is claimed that the original installation showed an efficiency of 88.45 per cent., when employing fuel of 9,930 B.th.u. per lb. average calorific value. During a trial conducted by an independent consulting engineer it was established that the boiler plant, when isolated on to a 10,000-kW turbo-generator (with an average load of 3,300 kW), produced electricity at a consumption of 19,100 B.th.u. per kWh.

MESSRS. COCHRANE & CO., LTD., of the Ormesby Ironworks, Middlesbrough, have received official intimation that their tender for the supply of 7,000 tons of cast-iron pipes to the Municipal Council of Port Elizabeth, Natal, has been accepted. The contract was secured against keen French and German competition.

Unemployment.

During the week ended March 14th there was a decrease of 25,360 in the number of unemployed. At that date the total was 1,118,700, as compared with 1,144,060 on March 7th, and with 1,070,843 on March 15th, 1926.

New Australian Companies.

Dux Electric Heaters (N.S.W.), Ltd., was recently registered in Sydney, with a capital of £100,000, to acquire an existing business, the nature of which is indicated by the title.

Another new Sydney registration is the Gloucester Electric Supply Co., Ltd., capital £10,000, to acquire a business of automobile, electrical and marine engineers, &c.

The Country Electric Supply Co., Ltd., capital £25,000, has also been registered recently in Sydney. This company has an agreement with the Murrurundi Council for the supply of electricity in the Council's area, and it will also carry on the business of electricians, electrical engineers and manufacturers, &c.

In Melbourne, Telephones and General Engineering Pty., Ltd., has been formed, with a capital of £100,000.

Trade Marks in Northern Europe.

Delegates of Sweden, Denmark, Norway and Finland are to meet again at Oslo on May 2nd to discuss a basis of common legislation on trade marks in the North European countries. These negotiations were initiated at a conference held at Stockholm last autumn.—*Reuter's Trade Service* (Stockholm).

Prices of Raw Materials.

Messrs. F .Smith & Co. report, March 29th: Copper (electrolytic) bars, £63, 2s. 6d. dec.; ditto ditto sheets, no change; ditto ditto wire rods, £73, 2s. 6d. dec.; ditto ditto h.c. wire, 3/16d., 1/16d. dec.

Messrs. James & Shakespeare report, March 29th: Copper bars (best selected), sheet and rod, no change; English pig lead, £28 5s., 30s. dec.

Messrs. Edward Till & Co. report, March 29th: India rubber, Para fine, no change.

Messrs. C. Clifford & Son report, March 29th:—Babbitts metal and anti-friction metal, Grade I, £268, £6 dec.; Grade II, £186, £4 dec.; Grade III, £96, £2 dec.

Lighting and Power Notes.

Bexhill.—Electrical Development.—The Corporation Electricity Committee has received a letter from the Electricity Commissioners stating that, having regard to the probability that further provision will have to be made in the near future in respect of supplies in the Little Common area, the Council should review the probable requirement of that area with a view to determining the proper course of development. The Committee has recommended that the Commissioners be informed that the electrical engineer has already reported upon this matter, and that it is proposed to go fully into the subject in the early part of next year.

Loan Sanctioned.—Sanction has been received to the borrowing of £5,000 for mains and £216 for switchgear.

Brackley.—Electricity Supply.—The Town Council has been notified by Messrs. Cecil Cooper & Co. that they have applied for sanction to supply electricity in the district. The charges for the first year will not exceed 10d. per kWh for private lighting, 6d. per kWh for public lighting, and 4d. per kWh for power.

Bradford.—Assisted Wiring Scheme.—The Corporation Electricity Committee has approved an assisted wiring scheme for small dwellings. According to the *Yorkshire Observer* the scheme will be limited to 20-point installations. The department will be prepared to wire houses for the number of points required for lighting and for any additional points required for heating. The payments for installations up to eight lighting points, with one five-ampere plug and two ten-ampere plugs, will be £2 down and sixteen quarterly payments, varying according to the installation required. In the case of installations with more than eight lighting points the terms are to be 20 per cent. down, and sixteen equal quarterly payments. These provisions will be subject to confirmation or modification in Council. The wiring will be carried out by registered contractors.

Electrical Progress.—The output of electricity since the beginning of April last is reported to have increased by nearly ¼ million kWh, as compared with the corresponding period of the previous year.

Brigg.—Electricity Supply.—The Urban District Council has requested Messrs. A. Hugh Seabrook & Partners to revise their report on electricity supply, submitted two years ago, and bring it up to date, with a view to taking definite steps in the matter.

Chile.—Electrical Developments.—*Commerce Reports* states that the Sociedad Carbonifera de Marfil has been awarded by a recent Government decree. a 50-year concession to supply the city of Valdivia and adjacent districts with electricity.

Continental.—Finland.—The Niskakoski Rapids, in Northern Finland, capable of developing 25,000 h.p., have been purchased by British investors. It is proposed to erect a power station.—*Commerce Reports.*

Germany.—The Markische Elektrizitätswerke Gesellschaft has recently put into operation a large new steam-operated power station at Finkenheerd, near Frankfort-am-Main, with the object of supplying power to the greater part of the German province of Brandenburg. The site for the station was selected on account of its proximity to lignite mines from which the necessary fuel can be conveniently drawn. The initial generating plant comprises two A.E.G. steam turbo-alternators, with a capacity of 16,000 and 12,500 kW respectively. Two 15,000-kVA, 6,500/52,500-55,000-V oil-cooled transformers have also been installed, these being directly connected up to the generators. A further 30,000-kW set is at present being installed, and the station will eventually have a capacity of from 100,000 to 125,000 kW. The initial steam-raising plant comprises five Babcock & Wilcox and five Steinmuller water-tube boilers, each having a heating surface of 6,996 sq. ft., with 5,166-sq. ft. pre-heaters and 2,152-sq. ft. superheaters. For the plant at present in course of installation four boilers working at a pressure of 40 atmospheres and giving steam at a temperature of 425 deg. C. will be utilised.

France.—The Chamber of Deputies has voted the Bill for the utilisation of the hydro-electric power obtainable from the fall of Kembs (Upper Rhine). The works will include the construction of a lateral canal, and the total expenditure is estimated at 251 million fr.—*Reuter* (Paris).

Darwen.—Inquiry.—An inquiry was held recently by Col. T. C. Ekin, for the Electricity Commissioners, into the application of the Corporation to extend its generating station by the installation of one 2,000-kW set. The Town Clerk said it became necessary some years ago to increase the local generating station or obtain supplies from other sources. Actuated by the high cost of construction at that period, the Corporation decided to purchase in bulk from Blackburn. By a judicious use of that supply, coupled with the town's own production, the joint agreement between the two Corporations had worked satisfactorily. Later it became apparent that the time could not be long delayed before further plant would have to be installed if electricity was to be supplied locally at a commercially practicable rate, and the Electricity Committee therefore framed a scheme showing the relative advantages of installing a 2,000-kW turbo-alternator in substitution for one of its smaller sets, as compared with the continued reliance on Blackburn's supply. Investigations showed that it was in the financial interests of Darwen to generate its own electricity rather than take bulk supplies.

Duntocher (Dumbartonshire).—Electricity Supply.—At a recent public meeting, a deputation was appointed to interview the Clyde Valley Electrical Power Co. with regard to a proposal to obtain an electricity supply for the district.

East Dereham.—Electricity Supply.—The Urban District Council has instructed the Clerk to arrange with the Norwich Town Clerk for the preparation of a draft contract for the supply of electricity to the Council for a period of 21 years on the following terms:—£4 10s. per kW of maximum demand, plus 0.71d. per kWh, Norwich Corporation to lay the main from Wymondham to Dereham gas works at its own expense.

Epsom.—Electricity in Small Houses.—The Town Council has decided to supply electricity to houses on the Horton estate for lighting, heating, cooking, &c., at an annual charge of £3 12s. per house, plus 1½d. per kWh.

Ilford.—Loans.—The Electricity Committee is making application for sanction to loans of £2,000 for wiring installations and £2,000 for the purchase of electrical apparatus to be let out on hire.

India.—Pykara Scheme.—It is understood that the Government of Madras has under contemplation the appointment of a hydro-electric expert to advise it on further progress of the Pykara scheme and to deal with the terms and conditions of the railway electrification. An announcement will be made as soon as an expert is secured.—*Indian Engineering.*

Irish Free State.—Killarney.—At a recent meeting of the Urban Council a letter was read from the Minister for Industry and Commerce, stating that he had received an application from the Kerry Electric Supply Co. for permission to erect electric mains in certain streets of the town of Killarney. The company stated that it had applied to the Council for permission to erect the necessary poles in the streets, but that its request had been refused. The Ministry has requested the Council to state its objections to the company's proposal, and the Town Clerk was directed to reply setting out the Council's objection to the erection of overhead lines in the streets.

Leek.—Electricity in Bulk.—The electrical engineer of the Urban District Council is negotiating with the Stoke-on-Trent Corporation for a bulk supply of electricity. It is proposed to take a supply of from 1,500,000 kWh to 5,000,000 kWh per annum, with a maximum load of 1,500 kW.

London.—Battersea.—Application is being made by the London Power Co., Ltd., for consent to establish a new generating station at Nine Elms.

Poplar.—Sir Andrew Duncan, chairman of the Central Electricity Board, has consented to open the new generating station on April 25th next.

Chiswick Power Station.—The *Financial News* reports that the London and Home Counties Joint Electricity Authority has signed an agreement with the Chiswick Urban District Council to acquire from the Council over 44 acres of the Duke's Meadows on which to erect a generating station. The agreement will be scheduled to the new Bill, which, with the assent of the Standing Orders Committee of Parliament, will shortly be introduced into the House of Commons in substitution for the Bill which failed to comply with the Standing Orders.

Paignton.—Purchase of Undertaking.—The Urban District Council has appointed Mr. J. H. Rider, consulting engineer, to prepare a preliminary report on the proposal to purchase the electricity undertaking of the Paignton Electric Light and Power Co., Ltd.

Plymouth.—Electricity Extensions.—The Corporation Electricity Committee, on March 22nd, approved a recommendation of the electrical engineer, Mr. E. G. Okell, for the provision of a h.p. feeder cable to St. Budeaux in order to meet the increasing demand in the Swilly and St. Budeaux districts and to complete a ring main for the greater security

of supplies throughout the area, in which there are now over 1,870 consumers. It was pointed out that the extension would involve the erection of a sub-station at St. Budeaux and the provision of additional transformers and switchgear at a total estimated cost of £20,996. Application is to be made for sanction to borrow the necessary money. The Committee also authorised cable extensions in 18 streets.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Smethwick, Oldbury, and Evesham.—*The Shropshire, Worcestershire and Staffordshire Power Co.*: Lighting: The surcharge of 7½ per cent. has been withdrawn.

Aylesbury.—The temporary increase of 10 per cent. made to domestic, business, and power consumers, has been removed.

Hornsey.—The 10 per cent. increase to be terminated.

Shipley.—Loan.—The Urban District Council is applying for sanction to borrow £2,500 for the purchase of electrical domestic apparatus to be let out on hire.

South Africa.—Cape Town.—The Corporation Electricity Committee reports that in the immediate future the Council will be laying the Electricity Commission's cables between Glencairn Quarry and the traction sub-station at Glencairn and it is suggested that the opportunity be taken to lay a 11,000-V cable between the Quarry and Glencairn Village. Supply to the far end of Kalk Bay, Fish Hook, and the Quarry depends on a single cable, and there is no doubt that a duplicate supply will have to be provided before very long. The cheapest and most economical way of obtaining this duplicate supply will be to take energy in bulk from the Electricity Commission's 33,000-V transmission system at Glencairn sub-station. By laying the cable now there will be a considerable saving in excavation and handling charges, and in the interim, capital charges on the cable can be covered by supplying Glencairn Village.

Loan.—The Corporation is to raise a loan of £500,000 for electricity purposes.

Southend-on-Sea.—Mains Extensions.—The Town Council has decided to carry out mains extensions, including a supply to Southbourne Grove, at an estimated cost of £3,060, subject to a Special Order being obtained to carry out the extension.

South Shields.—Street Lighting.—The Corporation is considering a scheme submitted by the borough electrical engineer for the conversion of 1,000 street lamps from gas to electric lighting.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the following authorities:—The Southend-on-Sea Corporation, authorising it to supply electricity in the urban district of Canvey Island and the rural district of Rochford; the Clacton Urban District Council, to supply in certain parishes in the rural district of Tendring; and the Cleveland and Durham County Electric Power Co., for the amendment of the South Durham Districts Electricity Order.

Stirling.—Electricity in Bulk.—In accordance with the plan for linking up electricity undertakings in Central Scotland, the Town Council, instead of laying down new plant to meet the growing demand, will take a bulk supply from the Scottish Central Electric Power Co., whose cable runs through the town. The agreement is to be for a period of five years. The cost will be £1 2s. 6d. per quarter per kW of the maximum demand, plus 7/10d. per kWh for electricity consumed. The Council is to erect the necessary sub-station, subject to the approval of the Electricity Commissioners.

Stoke-on-Trent.—Electricity Supply.—The borough electrical engineer has reported to the Electricity Committee that the Electricity Commissioners have suggested to the Newcastle-under-Lyme Corporation that the supply for next winter's load should be taken from Stoke instead of installing a new generating set.

The Committee has asked the electrical engineer to prepare a scheme for a supply of electricity to Endon.

Supply to Factories.—A report was submitted to the Committee upon the position with regard to factory supplies, and the electrical engineer was asked to prepare scales of charges, based upon load factor and consumption, with a view to reductions in the price to factories taking large quantities of electricity.

Swansea.—Street Lighting.—At a recent meeting of the Highways Committee the borough engineer reported that he had conferred with the borough electrical engineer with regard to the question of converting public lamps from gas to electric lighting in all streets where public lighting cables had been laid, and the latter had agreed to recommend his Committee to extend the cables in certain streets. It has been arranged to take over 935 of the existing gas lamps in various areas. When the work is completed the whole of the east side of the river, north of Morris Lane, up to Llansamlet, and the whole of the Oystermouth and West Cross district, will be lit by electricity. The borough electrical engineer was further prepared to connect 42 new lamps which it is proposed to erect in the near future principally in the Winchwen and Trallwn area, to the electricity mains. With regard to the public lighting of Ynistawe, it was reported that Messrs. Player & Son had been given six months' notice to terminate the present contract, and that at the expiration of that time the public lighting of this area would be undertaken by the Corporation's Electricity Department. A supply will then b given from underground mains and new and improved lam will be provided if allowance is made in next year's estimat for the cost of the necessary work.

West Midlands.—Plant Extensions.—Mr. S. T. Alle chief engineer of the West-Midland Joint Electricity Authorit in a recent paper before the Birmingham Electric Clu referred to the big developments in progress. He explaine that the area over which the West Midland Authority ha control covered over 1,000 square miles, and extended roughl from Tamworth to the Welsh border and from Stafford t Halesowen; it embraced 60 boroughs, urban and rur districts and parishes. The whole of the generatio would be carried out under one control, and the supplies electricity required by the existing owners of generatin stations would be sold at cost price; in effect, the scheme wa a co-operative movement. Immediate provision had bee made for the erection in sections of a new capital station Ironbridge, and provision would subsequently be made, i anticipation of the growth of demand, for the erection i sections of a further capital station. The Birchills an Ocker Hill generating stations were being extended wit plant to cost £366,000; an order for 33,000-volt, 500,000-kV capacity (and other) switchgear, covering an expenditure approximately £125,000, had just been placed—perhaps on of the largest single orders for switchgear ever placed in and for, this country.

Wolverton.—Opposition to Scheme.—At a public meetin held on March 23rd, a resolution was passed protestin against the use of overhead mains by the Northampto Electric Light and Power Co., Ltd., and the meeting pledge itself to decline the use of electricity unless undergroun mains were used. A copy of the resolution is to be sen to the Ministry of Transport.

Tramway and Railway Notes.

Continental.—Belgium.—A scheme is under considerati for the construction of an electric tramway between Courtra and Mouscrom. The line is estimated to cost about £98,500 of which the Belgian Government would be responsible fo one fourth.

Japan.—Revision of Electrification Scheme.—The Im perial Government Railways have decided to revise the elec trification scheme from the next fiscal year. According t the revised plan only some of the Tokio, Osaka and Kyot suburban lines will be electrified at present, and the electrifi cation of the whole of the Tokaido line has been postponed In connection with the electrification of the Otsu-Akashi line which will be commenced in the fiscal year 1929-30 the I.G.R. is to erect a hydro-electric power station nea Osaka, and a steam power plant as a reserve between Osak and Kobe.

Railless-Car Scheme.—Application has been made by Mr G. Takeuchi, of Shimodate-machi, Ibaraki-ken, for permissio to introduce a railless car service from Shimodate-machi t Makabe-machi, a distance of nine miles, at a cost of 117,00 yen.

Railway Extensions.—The Municipal Assembly of Osak has under consideration four schemes of extensions to electri railways in the city. They include the proposed Japan Elec tric Railway (a rapid transit railway) between Tokio an Osaka, the Sumiyoshi Electric Railway, with a capita of 2,000,000 yen from the city to Kosaka-machi, the Nanka Rapid Transit Railway, with a capital of 10,000,000 yen, fro the city to Sano-machi, and the Hanshin Electric Railway t be extended from Kobe to the city, with a capital of 30,000,00 yen.

London.—Inquiry.—The Ministry of Agriculture held a inquiry recently into the proposed purchase of land at South gate by the London Electric Railway Co. Mr. W. L. Lloy Roberts, for the company, said the land was required fo the development of the tube north of Finsbury Park. I would be an extension of the Piccadilly line. He quoted th recent London Traffic Report suggestion that the railwa should be extended to Wood Green or Southgate. After th company had looked into the matter it came to the con clusion that it could construct such a railway and would pur chase such land with a view to doing so. The assistan secretary and treasurer of the London Electric Railway Com pany said it was proposed to provide sheds for 172 cars.

Underground Goods Railway.—The entire board of th London Goods Railways, Ltd., formed last year to construc underground goods tubes in the London district, has bee reconstituted. According to *Modern Transport*, the new directors are Viscount Elibank (chairman), Colonel B. C L. Jervis, Sir Arnold B. Gridley and Mr. W. W. Paine Plans are being prepared, it is stated, and it is expecte that the enterprise will cost between £20,000,000 an £30,000,000. The original scheme has been revised, and it i hoped that all details will be completed in a few months time.

Telegraph and Telephone Notes.

Australia.—New Radio Receiving Station.—The La Perouse radio receiving station was opened recently by Amalgamated Wireless (Australasia), Ltd. It is capable of receiving messages from Tilbury Docks, London, as well as from the docks in Vancouver and San Francisco, and has also kept in communication with ships fitted with short-wave sets between these terminal ports. It will be the official receiving centre for Sydney, and will be in direct communication with all the "beam" feeder stations in Australia, and will automatically relay the messages received direct into the head office of the company. The same procedure will be followed regarding messages received from the Federal Government stations in New Guinea and the Pacific Islands, which are controlled by Amalgamated Wireless, Ltd. All transmitting will be done from the Pennant Hills centre, about 30 miles distant. The aerial system at La Perouse consists of four 72-ft. tubular steel masts in the form of a square, with one 99-ft. mast in the centre, and land-line connections have been installed between La Perouse and the General Post Office, Pennant Hills, and the head office of Amalgamated Wireless, Ltd.

Spain.—Madrid-Argentina Wireless Service.—At a meeting on March 23rd, the Cabinet approved of the establishment of a public wireless service between Spain and Argentina.—*Reuter* (Madrid).

Turkey.—Automatic Telephony.—We have been requested to state that the automatic telephone exchange at Angora was delivered by the Telefonaktiebolaget L. M. Ericsson, of Stockholm, and not by an American company, as reported some time ago. The network was installed by a private Turkish company.

United States.—New York Telephone Progress.—President J. S. McCulloh, of the New York Telephone Co., reviewing the achievements of his organisation during the past year, says that more than $78,000,000 was invested in 1926 to enlarge its system in New York State, northern New Jersey, and a small portion of Connecticut. Nearly $41,000,000 went for necessary expansion of the system in New York City. A total of 174,200 telephones was added during the year to the system, which now serves over 2,600,000 telephones, of which nearly 1,520,000 are in the five boroughs of New York City. The volume of local calls handled in the company's entire territory increased during the year from approximately 9,568,000 to about 10,288,000 per day. Toll and long-distance calls increased from 773,500 to 881,900 daily.

Radio Notes.

Australia.—Royal Commission.—The Royal Commission on Wireless, which has been appointed by the Government, met for the first time on February 7th, and the first public meeting took place on February 9th in Melbourne. The Commission is hearing evidence in the capital city of each State.

Continental Relays.—Proposed Exchange of Programmes.—Although the B.B.C. receiving plant at Keston relays American stations on Tuesday nights, Continental relays seem to have gone out of fashion in this country; yet it appears that they are finding favour abroad, for the *Evening News* reports that the so-called "rapproachment" subcommittee of the Office Internationale de Radiophonie recently met at Vienna to discuss the exchange of broadcast programmes by wireless link.

Denmark.—Reductions in Licence Fees.—The fee for a receiving licence has been reduced to 10 kr. for crystal as well as for valve sets; it formerly cost about 12s. 6d. for crystal and 15s. for valve sets. *World Radio* says that listeners in Denmark, on February 1st, reached a total of 130,446, of which 64,231 were crystal listeners and 66,215 valve listeners. The licence for receiving apparatus with loud-speaker for use in public places has been reduced from £25 to £10 yearly. The new high-power station will be ready in July.

France.—New Regulations.—All radio stations in France are now under the general administration of the Post, Telegraph and Telephone Service and the Ministry of the Interior. Private stations which receive communications other than private correspondence can be authorised by special agreement, the details of which are to be determined by decree, and after the payment of an "art tax" at rates to be determined. Places which charge for admission are, in addition, subject to an annual tax, which is also to be determined by decree. Private sending stations or receiving and sending stations may be established only by special authorisation of the Ministers of War, Marine, Interior, and the Post, Telegraph, and Telephone Service, with the consent of an interministerial committee. Three national and 18 regional establishments will be set up either under direct Government operation or by special concessionaires; the programmes will be under the charge of special groups approved by Government authorities. For the present it is intended that the Post, Telegraph and Telephone Service shall secure the co-operation of private groups, which will assume the financial burden of operating the large sending stations; a year hence the Government authorities will have the power to enter into contracts with private interests which shall run not longer than to January 1st, 1933, for the establishment and operation of the proposed stations. The concessionaire is to pay a tax, and the capital invested is to receive a dividend not greater than the interest on the advances of the Bank of France to the State, plus 2 per cent.; after charging 10 per cent. to amortisation and payment of dividends, the surplus profits are to be divided equally between the Government and the concessionaire. At the end of the contract period the operating authority becomes the owner of the properties subject to paying the non-amortised capital cost within five years. In spite of declarations by the Government that the new regulations do not contemplate nationalisation, they contain the possibilities of very strict Government control. Private radio equipment of all sorts is to be operated only by special permission; its use may be stopped at any time on the vote of a Government commission. Free access to the markets of the world is limited in the case of both public and private sending stations by the requirement that such equipment "must be as far as possible of French manufacture." A commission of 44 members, 22 of whom are to be Government officials, is to advise on all subjects covered by the decree or delegated to them by the ministers. According to *Commerce Reports*, one of the objects is to "establish a coherent, rational, and powerful" system which can combat foreign propaganda through the dissemination of French ideas.

Greece.—New Stations.—The construction at Athens of a new transmitting station by the Administration of Posts and Telegraphs is actually completed. With a view to choosing its wavelength, the station is now proceeding to make tests. According to *World Radio*, other stations are to be constructed at Janina, Patras, Syra, Zante, and Chio.

Irish Free State.—Cork Station.—The new broadcasting station at Cork of the Department of Posts and Telegraphs, constructed by Standard Telephones & Cables, Ltd., London, has almost completed its tests. It is located at Sunday's Well, and occupies the site of the old prison. Two 120-ft. masts support the aerial, which consists of four wires each 156 ft. long; an earth mat, composed of a network of copper wires, has been buried in the ground covering an area of approximately 20,000 square feet. The station is rated at 1.5 kW, which means that 1.5 kW is given to the oscillators, which in turn deliver 1 kW of unmodulated power to the aerial system, so that with 100 per cent. modulation a "peak" power of 4 kW can be handled without distortion, assisted by the use of a condenser microphone. Standard Telephones & Cables, Ltd., with its associated companies, has constructed some 38 broadcasting stations of a similar size. The frequency of the carrier wave is maintained constant within 0.01 per cent. The power required to operate the complete station is about 9 kW, obtained from the local supply mains and used to drive motor generators. It is hoped that this station will cover the south and west of the Free State, and the *Irish Times* is informed that it is hoped formally to open the station on the 25th proximo. Arrangements are in hand for the fitting up of a suitable studio and necessary office accommodation in the station premises. The wavelength is 400 metres. One programme only will be given from both the Cork and Dublin stations, trunk telephone lines being used to connect the two studios.

South Africa.—New Company.—The African Broadcasting Co. has been registered with a capital of £50,000 to broadcast throughout the Transvaal, and ultimately Rhodesia and Mozambique. According to the *Financial News*, the Government has two directors on the board of the company, which was promoted by Schlesinger.

Spain.—Regional Control.—Two more stations, Radio San Sebastian (EAJ8) and Radio Salamanca (EAJ22) have been taken over by the Union Radio, the object being to endow Spain with a regional service, so as to enable listeners on crystal sets to enjoy a variety of programmes.

United States.—New Radio Law.—The failure of the United States Senate to confirm the nomination of two of the five men selected by President Coolidge to be members of the new Federal Radio Commission has been followed by the President making "recess" appointments of the two men in question, says *World Radio*. The Board is handicapped, since the Deficiency Bill, which authorised $120,000 for salaries and other expenses, failed to pass before Congress adjourned. Mr. Herbert Hoover, Secretary of Commerce, is co-operating with the Commission in its efforts to function. The main problems before the new body just now are overlapping and heterodyning.

Wave Propagation.—Effect of Receiving Aerials.—Mr. R. H. Barfield, of the Radio Research Station, Slough, recently estimated the extent to which a large number of receiving aerials contribute to the absorbing effect of the earth's surface on wireless waves in resonance with them.

Calculation showed that, with a density of aerial distribution such as now exists in an urban district surrounding a local broadcasting station, the energy absorbed by the aerials should be the decisive factor in determining the surface attenuation, and experiments have yielded results that constitute very definite evidence of a critical effect of large magnitude occurring at or near the resonant wave-length, the phenomenon appearing only ascribable to the selective action of the multiplicity of tuned aerials in the path of the waves. Thus, at Slough an increase in intensity of the order of 90 per cent. was observed for a variation in wave-length of only 5 per cent.; while for a wave-length change of 120 metres a total increase of field strength of nearly five to one was obtained; that is, for a given power transmitted, the received power increased more than twenty-fold. It is explained in *Nature* that the hypothesis that this effect is mainly due to the transmitted waves passing in and out of resonance with the aerials in their path is confirmed by the fact that the effect was found to increase in proportion to the distance which the waves travelled over crowded residential districts, and was negligible when the wave path lay almost entirely over open country with only a small residential area round the transmitter; the hypothesis was further confirmed by the fact that the effect was shown not to be peculiar to a given transmitter or receiving site. On the other hand, it seems at first to be contradicted by the fact that the minimum intensity, and therefore apparently the maximum absorption, does not occur at the resonant wave-length, but at a wave-length considerably below: in some cases the minimum had not been reached at 300 metres, below which wave-length experiments have not yet been carried. A brief study of the theoretical side of the problem, however, shows that this is not necessarily the case. The observations on which the above note is based were carried out as part of an investigation for the Radio Research Board of the Department of Scientific and Industrial Research.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the Electrical Review containing the advertisement is given in parentheses below.

Contracts Open.

Australia.—Melbourne.—May 10th. Postmaster-General's Department. Telephone relays. (B.X. 3333.)*
May 17th. Resistances and reactances. (B.X. 3307.)*
May 23rd. State Electricity Commission. Switchgear and accessories. (B.X. 3285.)*
May 9th. 6,600-V transformers and spares. (B.X. 3331.)*
July 5th. One 15,000-kW steam turbo-generator and accessories. (B.X. 3369.)*
Sydney.—May 9th. Electricity Department. Station auxiliary switchgear. (B.X. 3338.)*

Ayrshire.—Education Authority. Electric lighting and central heating installations for the addition to Ardeer public school. Mr. J. E. Shaw, clerk, Education Offices, Ayr.

Barnes.—Electricity Department. 1,200 yd. l.p. armoured multiple cable. (See this issue.)

Barking.—May 9th. County of London Electric Supply [illegible] Ltd. Cables and accessories for the Barking power [illegible]. (See this issue.)

[illegible]enham.—April 4th. Electricity Department. Three e.n.p. transformer sub-station switchboards. (March 18th.)

Belfast.—April 7th. Electric lighting and power installations at New Museum and Art Gallery, Botanic Gardens Park. Town Clerk's office, City Hall.

Bolsover.—April 19th. Urban District Council. Cables, boxes, pillars, &c. (See this issue.)

Bristol.—April 11th. Electricity Department. 39 miles (approx.) 3-core, paper-insulated cable. (March 18th.)

Clayton.—April 18th. Urban District Council. E.h.p. feeder cables, l.p. distributing mains, fuse pillars and transformer kiosk. (See this issue.)

Colombia. — Bogota.—April 30th. Ministry of Public Works. Two electric lifts. (A.X. 4433.)*

Edinburgh.—April 18th. Electricity Supply Department. De-aerating plant and boiler feed pumps. (March 25th.)

Grimsby.—April 2nd. Electricity Department. Deansgate balancer set, switchgear and cablework. (March 25th.)

India.—April 5th. India Store Department. 27,000 yd. paper-insulated armoured cable for telephones. (March 25th.)
April 26th. 66-kVA motor-driven alternator sets, transformers, switchgear, &c. (See this issue.)

Kilmarnock.—April 6th. Ayrshire Electricity Board. Two water-tube boilers, with superheaters, economisers, air heaters, mechanical stokers, and coal-handling plant. (March 18th.)

Leeds.—April 7th. Board of Guardians. Electrical wiring of certain blocks and electric bell installation at the Beckett Street Institution. Mr. J. Edwin Storr, consulting engineer, Midland Bank Chambers, 13, Bond Street, Leeds.

London.—Holborn.—April 13th. Board of Guardians. Electric lighting installation at the London Road, Mitcham, schools. (March 18th.)

London County Council. April 12th. Wiring and fittings for electric lighting for Everington Street School, Fulham (approx. 196 points). (See this issue.)
G.W.R. April 21st. Stores, including electrical wires and cables and telegraph ironwork. (See this issue.)

Middlesbrough.—April 8th. Electricity Department. 12 months' supply of cables and meters. (March 25th.)

New Zealand.—Wellington.—May 31st. Public Works Department. 50-kVA transformers for the Waikaremoana electric power scheme. (B.X. 3294.)* 50-kVA transformer for Arapuni scheme. (B.X. 3293.)*
June 7th. Railway sub-station equipment, Lake Coleridge electric power scheme. (B.X. 3295.)*
May 4th. General Post Office, Stores Division. Sub-station protectors. (B.X. 3286.)*
June 13th. New Zealand Railways. Machine tools, workshop equipment and overhead electric travelling cranes. (A.X. 4344.)*
June 6th. Six electric locomotives. (A.X. 4355.)* Overhead equipment for the Christchurch-Lyttelton electrification scheme. (B.X. 3301.)*
Invercargill.—May 21st. Southland Electric Power Board. Transformers. (B.X. 3379.)*
June 15th. 66,000-V, oil circuit-breakers. (B.X. 3378.)*

Plymouth.—April 25th. Electricity Department. Electricity meters, cables, and transformers. (See this issue.)

Southend-on-Sea.—April 9th. Light Railways and Electricity Department. Remote-controlled rotary convertors. (March 11th.) April 19th. 4,000 joint boxes. (March 25th.)
April 19th. 1,400 current limiters. (See this issue.)

Uruguay.—Montevideo.—June 15th. State Electricity Supply Works. 15 transformer sub-station equipments (6,600/220 V, 50 cycles). (B.X. 3371.)*

Wrexham.—April 19th. Electricity Department. One 250-kW rotary-convertor equipment and d.c. switchgear. (See this issue.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Australia.—Sydney.—Electricity Supply Committee. Recommended:—
Tungsten-filament electric lamps (£7,955).—Warburton Franki, Ltd.
33,000-V cable and pilot cable (£67,594).—British General Electric Co., Ltd.
H.p. and l.p. cables (£86,344).—Standard Telephones and Cables (Aust.), Ltd.
Outdoor automatic oil switches (£8,800).—English Electric Co. of Australia, Ltd.
Two 1,000-kVA transformers (Spec. 1,082) (£2,129); distribution transformers (Spec. 1,088) (£11,684).—Electrical Plant Manufacturers, Ltd.

MELBOURNE.—Electric Supply Committee. Accepted :—
30,400 yd. fibre conduit (£3,673).—Standard Telephones and Cables (Aust.), Ltd.
110 ornamental street-lighting units (£2,716).—Australian General Electric Co., Ltd.

BRISBANE.—City Council. Recommended :—
94 traction motors: 11 Metropolitan-Vickers Electrical Co., Ltd. (£2,706); 38 made in U.S.A. (£10,055); 45 ditto (65 per cent. made in Australia) (£11,925).—Australian General Electric Co., Ltd.
—*Tenders.*

Bexhill.—Electricity Committee. Recommended:—
Three feeder panels (£216 each).—Bertram Thomas.

Brighton.—Health Committee. Accepted:—
Installation of X-ray apparatus at sanatorium (£326).—Solus Electrical Co.

Dundee.—Electricity Committee. Accepted:—
Two boilers for Carolina Port electricity station (£36,589).—Babcock & Wilcox, Ltd.

Chester.—Corporation. Accepted:—
Supply and fixing of an electrically-driven pump at the junction of Appleyards Lane and Hartington Street (£298).—Pulsometer Engineering Co., Ltd.

Epsom.—Urban Council.
Wiring houses on the Horton site for electric light.—Mr. Pengilly (£2,083, accepted).

Hornsey.—Electricity Committee. Recommended:—
Stoneware troughs.—Doulton & Co., Ltd.
Cables.—Pirelli-General Cable Works, Ltd., and Standard Telephones & Cables, Ltd.
Six 4-way distribution boxes and six 6-way boxes (£324).—Motor Gear & Engineering Co., Ltd.
Extension of Hewittic set at Highgate sub-station (£1,244).—Hewittic Electric Co., Ltd.

Irish Free State.—Controller of Stores (Posts and Telegraphs) :—
Cable turning section and end panel.—Standard Telephones and Cables, Ltd.
Cables.—W. T. Henley's Telegraph Works Co., Ltd.
Heat coils.—Phœnix Telephones & Electric Works, Ltd.
Fuses.—International Electric Co., Ltd.
Telephone plugs.—Ericsson Telephones, Ltd.
Sections, switch, No. 9.—Standard Telephones & Cables, Ltd.

London.—METROPOLITAN WATER BOARD. Accepted :—
Four months' supply of "Siemens" gasfilled lamps.—Siemens & English Electric Lamp Co., Ltd.

LONDON COUNTY COUNCIL.—Education Committee.
Electric lighting installation at Barrett Street trade school.—Alpha Manufacturing & Electrical Co., Ltd.

METROPOLITAN ASYLUMS BOARD.—Installation of electric lighting at Millfields, Rustington, Littlehampton.—Alpha Manufacturing & Electrical Co., Ltd.

STEPNEY.—Electricity Supply Committee. Recommended :—
50 tons pitch (£262).—Smith's Tar Distillery, Ltd.
50 t.c.c. disconnecting boxes (£105).—Universal Electrical Manufacturing Co., Ltd.

Supply of cables for two years :—

W. T. Henley's Telegraph Works Co., Ltd. ...	£38,295
Hackbridge Cable Co., Ltd.	38,477
Macintosh Cable Co., Ltd.	39,057
Standard Telephones & Cables, Ltd.	39,059
British Insulated Cables, Ltd.	39,072
W. T. Glover & Co., Ltd.	39,111
Pirrelli-General Cable Works, Ltd.	39,348
Callender's Cable & Construction Co., Ltd....	39,370
Siemens Bros. & Co., Ltd.	40,175

London Midland & Scottish Railway Co.
Electric lamps for nine months.—Siemens & English Electric Lamp Co., Ltd.

New Zealand.—AUCKLAND.—Electric Power Board.
22,000-V cable from the Penrose sub-station to Auckland (£65,150).—Siemens Bros. & Co., Ltd.
—*Tenders.*

South Africa.—CAPE TOWN.—Electricity Committee. Accepted :—
20 tons hard-drawn bare copper wire (£1,584); 8 tons copper wire (£605).—British Insulated Cables, Ltd.

Recommended :—
Crane (£162); paper-insulated cable (W. T. Glover and Co.'s manufacture) (£197).—Davis & Soper, Ltd.
Transformer (£110).—S.A. General Electric Co., Ltd.
Extensions switchboard, Burg Street (£171).—A. Reyrolle & Co., Ltd.
Two switch panels in connection with the electrification of Brackenfell quarry (£224).—British Thomson-Houston Co., Ltd.

Stoke-on-Trent.—Stores Purchasing Committee. Accepted :—
Electric lamps.—Blackburn, Starling & Co., Ltd.; Barnett, Soans & Gould; Robinson & Hands Electrical Co., Ltd.; H. W. Teeton; Hawley & Ingram; and Potts & Co.

Electricity Committee. Accepted :—
De-aerating plant at central power house (£1,581).—Hick, Hargreaves & Co., Ltd.
Boiler and feed pumps (£1,716).—G. & J. Weir, Ltd.
Supply of cables and laying mains for the year.—Callender's Cable & Construction Co., Ltd.

Tynemouth.—Trade and Commerce Committee. Accepted :—
Wiring fish quay sheds for electricity (£145).—W. W. Ward & Son, Ltd.

Electricity Committee. Accepted :—
Cables (£128).—Edison Swan Electric Co., Ltd.

Forthcoming Events.

Institution of Engineers-in-Charge.—Saturday, April 2nd. Holborn Restaurant, London. 6.30 p.m. Annual dinner.

Salford Technical and Engineering Association.—Saturday, April 2nd. Royal Technical College. 7 p.m. "Electro-Deposition of Metals." Mr. E. J. Dobbs.

Society of Engineers.—Monday, April 4th. Burlington House, W. 5.30 p.m. "Some Aspects of Reinforced Concrete." Mr. G. C. Workman.

Röntgen Society.—Tuesday, April 5th. 32, Welbeck Street, W. 8.15 p.m. Ordinary meeting.

Association of Supervising Electrical Engineers.—Tuesday, April 5th. Junior Institution of Engineers. 7.15 p.m. "Lighting of Small Towns." Dr. J. A. Purves.

Institution of Electrical Engineers.—Thursday, April 7th. London. 6 p.m. "The Number of Tests required to establish the Rupturing Capacity of an Oil Circuit-breaker." Messrs. W. B. Whitney, C. E. R. Bruce, and E. B. Wedmore.

(Wireless Section).—Wednesday, April 6th. London. 6 p.m. "Battery Eliminators," by Messrs. P. R. Coursey and H. Andrewes.

(North Midland Centre).—Tuesday, April 5th. Hotel Metropole, Leeds. 7 p.m. Annual general meeting.

(North-Western Centre).—Tuesday, April 5th. Engineers' Club, Manchester. 7 p.m. Annual general meeting. "The Stability of Large Power Stations." Mr. F. H. Clough.

Women's Engineering Society.—Friday, April 8th. 26, George Street, W.1. 6.30 p.m. "A Business Woman's Trip to America." Miss E. M. Kennedy.

Institutions of Civil, Mechanical, Electrical, Municipal and County, and Locomotive Engineers (Yorkshire Sections).—Friday, April 8th. Great Northern Hotel, Leeds. Joint delegation dinner.

Junior Institution of Engineers.—Friday, April 8th. 39, Victoria Street, S.W. 7.30 p.m. "Electrical Osmosis." Mr. E. Ambrose.

Royal Institution.—Friday, April 8th. 9 p.m. "Early Days in Radio Activity." Sir Ernest Rutherford, F.R.S.
Saturday, April 9th. 3 p.m. "Alpha Rays and Atomic Structure." Sir Ernest Rutherford, F.R.S.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, April 9th. At the School of Mines, Treforest. 6 p.m. "Aerial Wire Ropeways." Mr. J. W. White.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following :—

VITRITE insulating material for lamp caps.

Notes.

The Batti-Wallahs' Society.

On Tuesday last week, at the Hotel Cecil, the Society celebrated its 21st birthday by converting the annual dinner into a dinner-dance, and the experiment proved so popular that it will probably have to be repeated. No outstanding guests of honour were there, but Mr. President A. W. Blake and Mr. Vice-President G. W. Partridge presided over a jolly gathering of some 200, which included a number of ladies and gentlemen famous in the electrical industry.

We recently received a neat little brochure recording the history of the Society, which derived its origin from a suggestion by Mr. L. M. Waterhouse in 1905, that old P. & O. Batti-Wallahs should band together.

Telephone Insurance.

What is claimed to be the first insurance concern in the world specialising in the insurance of private telephone installations against damage and breakdown has recently been formed in Berlin, with a capital of £20,000, and the title of the Tela Versicherungs Gesellschaft für Technische Anlagen.

Illuminated Road Signs.

The accompanying illustration shows day and night views of one of a number of road signs of the Hendon Urban District Council which have been illuminated. Tests carried out at night showed that the illuminated sign could be distinguished easily 500 yards away in clear weather, and 200 yards away in fairly heavy fog. A 20-W red-sprayed

An Illuminated Road Sign: Day and Night Aspects.

"Osram" sign-type lamp is fitted at the apex of the red triangle, and a 20-W squirrel-cage vacuum lamp, with a special vitreous-enamelled-steel dispersive reflector supported by a bracket, is centrally fitted below the base of the triangle in order to direct a beam of concealed light on to the actual character and wording of the sign. A standard G.E.C. 1.5-A time switch controls the lamps, lighting and extinguishing them at predetermined times automatically without any attention except winding once a fortnight. At each winding the switch is reset to operate the lamps at times coinciding with the lighting-up regulations. The installation was designed by the General Electric Co., Ltd.

Faraday House Old Students' Association.

The Association's function this term took the form of a dance, held in co-operation with the Faraday House Rugby Club, on March 18th, and was well supported by old students, who represented practically every branch of the electrical world. Dancing continued until midnight, with a short interval for a humorous entertainment provided by the well-known artistes, Robert Pitt and Langton Marks. Amongst those present were Mr. J. F. Watson, of Messrs. Callender's Cable and Construction Co., Ltd., president of the Association, Dr. Alexander Russell, and Mr. Michael Terry, F.R.G.S., the well-known explorer. This was the Association's first dance, and those present unanimously agreed to make it an annual function.

Service Notes.

Royal Air Force.—The British War and Victory Medals of a large number of ex-officers and ex-airmen still remain to be issued, despite the efforts made to distribute them. The Air Ministry appeals to ex-Service *personnel* entitled to them to apply at once and give the necessary information.

The Air Ministry announces that a considerable number of short-service commissions will be granted in July, and it is prepared to consider applications now from candidates between 18 and 25 who wish to fly. The officer who, after five years' service in the Air Force, reverts to civil life will, if he has taken advantage of the facilities provided for him, find himself well qualified to obtain civil employment. Applications for forms and regulations should be addressed to the Secretary, Air Ministry, Adastral House, Kingsway, W.C.2.

Some Problems in Illuminating Engineering.

The last meeting of the Illuminating Engineering Society, which was held at the Lighting Service Bureau, London, on March 22nd, was devoted to the discussion of a series of problems in illuminating engineering, briefly introduced by various speakers.

The first item was a contribution from Mr. L. M. Tye, who described the lighting of the Greyhound Theatre and Dance Hall at Croydon, as an interesting example of decorative lighting. The installation had to be so designed that the dance hall could be changed over to a theatre or concert hall in 15 minutes. A panelled partition was provided between the dining room and the new interior, so that independent entertainments could go on simultaneously. The interior can also be used for kinema displays, and the system of lighting is both flexible and decorative. The general lighting is indirect, and is furnished by a very large central fitting. A feature is the equipment of this fitting with supplementary Holophane colour-units to be used on festive occasions: special battens, spot-lights, &c., for the stage-lighting are also provided, and the whole equipment forms a striking instance of the use of light to enable the proprietors of hotels to provide attractive entertainments, as well as to dispense meals.

Mr. W. Millner described the lighting installation in the Cathedral of St. Sophia, London, of which an account appeared in the Electrical Review of November 19th, 1926.

The next problem, the lighting of a greyhound racing track, was dealt with by Mr. H. H. Long, who pointed out the difficulty of furnishing adequate illumination and at the same time avoiding glare in the eyes of spectators. This is effected by mounting a series of projectors along the outer edge of the track only three feet above the ground, the beam being in each case slightly depressed and projected inwards on to the centre line of the track, in the direction of the racing.

Mr. J. S. Dow presented a simple problem in railway lighting due to Mr. A. Cunnington (Southern Railway). At a suburban station it had been found that engine drivers found great difficulty in identifying the distant signals when approaching the platform. The trouble was traced to the glare caused by exposed lamps along the platform, and after new reflectors for screening the mantles had been substituted there was no further trouble. Mr. Dow also gave a summary of recent attempts to improve the efficiency of optical lanterns and kinema projectors, raising the problem whether it was possible, by any arrangement of lenses or mirrors, to produce an image brighter than the source of light. It would be observed that this might require the utilisation of only a small fraction of the original light emitted, if the image were small; but possibly there was some fundamental thermodynamic reason why this could not be done.

Mr. L. E. Buckell raised several interesting problems in connection with the use of coloured light, Mr. S. G. Elliott discussed various problems met with on the underground railways, and Mr. G. Herbert described the method of lighting the gardens at the Ideal Home Exhibition. It was announced that the next meeting, in April, would be held at the National Physical Laboratory.

The Shannon Power Scheme.

Mr. McGilligan, Minister for Industry and Commerce for the Irish Free State, speaking on the second reading of the Electricity (Supply) Bill, said that the Shannon scheme was projected to supply electricity to all towns and villages of 500 population and upwards in the State. Actually it would not do so—there was a certain number of small towns left out. Taking the most up-to-date returns, there were 225 towns of 500 population and upwards, and the total was 1,135,000 people. At present there were 20 statutory undertakings, and over 90 non-statutory or unauthorised undertakings. Of the 20 statutory undertakings, five were privately owned, and 15 were under the control of municipal authorities. The five privately-owned served a population of about 109,000, and the 15 municipal undertakings supplied about 502,000 people. Of the 90 non-statutory undertakings, 12 were situated in places of less than 500 population and were left out of the calculations; the 78 remaining were in areas with a total population of some 164,000. Areas of 500 population in the country without electricity supply had a total population of about 264,000. The position with regard to the whole Shannon undertaking was that in about 1929, under ordinary conditions, the annual consumption of electricity in the country would be seventy million units, and the problem was to make that remunerative at the experts' price based on 110 million units.

Appointments Vacant.

Shift engineers for the Newcastle-on-Tyne Electric Supply Co., Ltd. Two shift engineers for the Park Royal Hospital, N.W.10. Junior shift engineer for the Kingston-on-Thames Electricity Department. (See our advertisement pages to-day.)

High-Pressure Steam Turbines.

A steam turbo-plant installed at the Langerbrugge power station of the Centrale Electrique de Flandres (Belgium), by the Brown-Boveri organisation, utilises the high initial steam pressure of 710 lb./sq. in. gauge, superheated to a temperature of 830 deg. F. The present installation, which has been in service for over a year, consists of a 1,750-kW primary turbine, designed for the above inlet steam pressure. In passing through the turbine the steam is expanded down to a gauge pressure of 285 lb./sq. in., and is then led to a 6,600-kW low-pressure set. The operation of this plant has been so satisfactory that an order has now been received for extensions. The output of the new primary turbine will be 6,000 kW, the steam conditions being exactly the same as for the original plant. The new set will deliver steam to three additional low-pressure sets.

In this installation full use is made of the fact that with high-pressure plant the advantages of feed-water heating can be carried much further than with low pressures, and in this case the feed water is pre-heated to about 390 deg. F. By the use of such high-pressure steam the overall efficiency of the plant is considerably increased.

Coventry's New Electricity Works.

Good progress is being made with the preliminary works of the new electricity station which the Coventry City Council is establishing at Foleshill. Levelling and excavations are proceeding on a 53-acre site adjacent to the Oxford canal, by which the works will be served, and there will also be a siding to connect with the Nuneaton and Coventry branch of the L.M. & S. Railway. A contract running beyond £500,000 is being carried out by the British Thomson-Houston Co., Ltd., Rugby, for the buildings and equipment for generating 37,000 kW, and the station will be capable of extension to an ultimate capacity of about 100,000 kW. The cables, &c., are expected to cost another £200 000. In the vicinity of the site was formerly a colliery, which many years ago was closed down in consequence of an underground fire, and has never been re-opened. There is plenty of water in the coal seams, and boring is taking place to reach it, as the new station will require 40,000 gallons per hour for cooling purposes. This supply will be supplemented from a stream which runs through the site, and arrangements may, perhaps, be made for using water from the canal.

Teachers in Technical Institutions.

The annual conference will be held this year at Plymouth, from Friday, June 3rd, to Tuesday, June 7th. The provisional programme includes, in addition to the business of the conference, a number of visits, moorland and sea excursions, and an educational and industrial exhibition in the Guildhall from June 4th to 10th inclusive.

Electric Vehicles in New York.

More than 2,000,000 loaves of bread are consumed daily in the Metropolitan section, it was estimated recently on the completion of the New York Edison Company's survey of bakeries using electric trucks, the results of which were made public at the seventh annual Electric Truck Show in the Company's showroom. The survey showed that fifty bakeries in the Metropolitan district employ a total of 1,271 electric trucks, and that they carry between 1,200 and 1,500 one-pound loaves apiece at every load. Bakeries use more electric trucks than any other single industry in Greater New York, it was found; transportation companies are next, thirty companies employing 797 "electrics"; and the fifty-six provision companies that use 580 "electrics" come third. New York's big stores together employ 571 electric delivery trucks, the last horse in the service of any big store having been ousted a year ago. In Manhattan and The Bronx alone, 352 companies employ a total of more than 3,500 electric trucks.

A miniature 2-passenger electric roadster weighing only 200 pounds, which has a 62-inch wheelbase and will run at ten miles an hour, was introduced to the public at the Show. It is designed for practical service in the city or country. The chassis is of the buckboard type, with ash slats, and the wire wheels are fitted with over-size pneumatic tires. An electric motor similar to the starting motor of a gasoline automobile drives the rear wheel by a gear train. The standard storage battery will drive the car from twenty to thirty miles, depending on the road, on a single charge. Foot pedals are used to operate both the emergency and service brakes, and also the 2-speed motor control. The roadster is equipped with head and rear lights, a standard size electric horn, and a device which cuts off the supply of electric current and locks the emergency brake.

Two double-headed electric fire and "wrecking" trucks, with drivers' seats, steering apparatus, and "wrecking" cranes at both ends (so that they can be run backward or forward equally as well) are to be used for safeguarding the traffic in the new Holland vehicular tunnel, for removing disabled automobiles from the tunnel, and in emergencies of all kinds. They have been specially designed for working in the limited space available in the tunnel, and will carry a crew of seven men in addition to the chauffeur. For fire fighting the trucks will use chemical "foam" apparatus, connected with the tunnel's water supply, with ladders, portable inhalators for resuscitating those overcome by smoke or fumes, gas masks, electric lanterns and searchlights for penetrating smoke, as well as first-aid equipment, &c. In addition, a tower and pump wagon will be used for tending the lights in the tunnel, which will be 12½ ft. above the roadway, and also the lights on the plazas, 24 ft. above the street; it is equipped with a mechanical elevating tower operated by a motor from the storage battery in the truck. It will also carry 250-gallon per minute and 30-gallon per minute rotary pumps for removing the seepage of the tunnel collected in the sumps; the 30-gallon pump also will be electrically operated from the storage battery. A standard 2-ton utility truck will be used for hauling purposes in the tunnel work. The manufacture of the trucks is now being completed by the Commercial Truck Company, Philadelphia.

The Piezo-Electric Effect in Rochelle Salt Crystals.

Although the piezo-electric effect in Rochelle salt crystals cut normal to the *a* crystallographic axis has been studied, the only work on plates normal to the *b* and *c* axes consists of some old measurements by Pockels at room temperature. Plates were cut from a large crystal perpendicular to each of the three crystallographic axes. Electrodes of tinfoil were attached by means of Canada balsam and pressure was applied at 45 deg. to the axes in the plane of the faces on which the charges produced were measured. The changes in the values in the *b* and *c* directions per degree rise in temperature were found to be very far less than in the *a* direction. It was found, moreover, that the electrical anomalies, such as fatigue, hysteresis, and residual charges, were relatively much smaller in the *b* and *c* directions. Although the crystal cut normal to the *b* direction is much less active than one cut normal to the *a* direction, the absence of these irregularities and of the large temperature coefficient just above ordinary room temperature would make the crystal cut in this way more useful in practical applications of the piezo-electric effect. It is still about twenty times as active as quartz.—Joseph Valasek, in *Science*.

A Street-Lighting Tower Wagon.

A somewhat unusual electric tower wagon has recently been put in service by the electrical department of the Lynn Gas and Electric Co., of Lynn, Mass., U.S.A., for the maintenance and trimming of the electric lamps used for public street-lighting purposes in that city. The service extends over an area of 26½ square miles, in which a total of 767 lamps have to be periodically attended to, 268 of the lamps being of the arc type and the remainder incandescent. The arc lamps are suspended at a height of from 19 to 22 ft. above the ground, and the incandescent ones from 16 ft. upwards. Formerly maintenance was carried out with the aid of a horse-drawn tower wagon by means of which a couple of men were able to deal with 35 lamps only in a working day of eight hours, whereas with the electric vehicle sixty lamps are now being dealt with in the same time. The new vehicle is a standard one-ton electric truck fitted with a tower of light steel construction; the platform, in its folded-up and lowered position, is 12 ft. above the ground. The raising and lowering gear of the tower is electrically operated and so arranged that it can be locked at any point up to a maximum height of 17 ft. The platform is mounted on a turntable and is provided with folding sides and also with a folding sub-platform 2 ft. higher than the main one, enabling the two workmen to deal with lamps up to a height of over 19 ft. The chief novelty of the vehicle is the provision of two driving seats, one above the other, with duplex steering wheels and electric speed controllers, the upper steering wheel being 8 ft. above the ground, an arrangement which is claimed to have resulted in the saving of a considerable amount of time, inasmuch as the vehicle can be shifted from lamp to lamp without the driver, who is also one of the lamp trimmers, having to descend from the platform to the main driving seat. Spare lamps, materials, and also the necessary tools are carried in a small van body at the rear of the chassis. As a result of the satisfactory use of the first vehicle, the Lynn Co. has recently ordered a second outfit on similar lines, except that the tower platform will have minimum and maximum heights of 12 ft. 5 in. and 18 ft. 9 in., rendering the use of a sub-platform unnecessary. It will be recalled that at a recent I.E.E. meeting, Mr. H. T. Harrison advocated the use of such vehicles in this country.

Electrical Refrigeration.

The last E.D.A. salesmanship conference of the session was held on March 18th. Alderman Sir Duncan Watson presided, and Mr. N. E. Barber repeated the paper which he recently read at Newcastle (*vide* Electrical Review, February 4th, p. 195). The discussion which followed consisted mainly of questions. Mr. R. Wilson asked Mr. Barber if he had ever known a non-hermetically sealed machine which had caused illness or death through leakages of SO_2. Mr. Harwood emphasised the necessity for silence in operation, particularly in the case of domestic plant. That, he presumed, depended upon the speed of operation. Mr. Hughes asked within what limits automatic control should operate. He also asked what were the possibilities with regard to the use of a vacuum as an insulating medium. Mr. A. H. Morris asked for information as to the relative costs of the various apparatus. He believed the apparatus known as the "ice

stove," which could be heated electrically or by gas, and had no moving parts, was sold at a price far below that of other refrigerators. Mr. W. Ritchie asked by what method Mr. Barber would adapt the average pantry as a refrigerating chamber, and how the cost would compare with that of a self-contained machine.

Mr. Barber said that he had never heard of a death resulting from a leakage of SO_2 or other refrigerant. He agreed that refrigerating machines should run silently, and in this respect the manufacturers of electric motors and drives could help a great deal. A moderate-speed motor was required. The limits of control depended upon the duties put upon the refrigerators. If automatic control were used he believed that, generally speaking, 3 degrees tolerance—say 2 up and 1 below—could be regarded as quite close commercially, and, provided the maximum was within the safe conservation temperature, he did not think it mattered very much if it were 5 or 4. He did not know that the use of a vacuum for insulation purposes had been seriously attempted on a commercial scale. He considered that its use would increase the price. The every-day universal types of machines cost much about the same, taking everything into consideration. The pure absorption machine was quite a cheap machine to make and sell, but not to run. There were a number of automatic and semi-automatic absorption machines of British and Continental makes, but they all suffered from the disability of high running costs. There was not very much difference in the cost of providing an independent refrigerator and that of insulating an existing site. The insulated site was superior from the point of view of utility and thermal efficiency, and, consequently, running cost, but it had to be borne in mind that if a pantry were insulated the insulation was a fixture and became the property of the landlord.

Alphabet-itis.

Electrons, saucy little devils,
Were wont to find their proper levels
When Mr. Hildebrand de Vere,
The great consulting engineer,
Arrived upon the scene to test,
With megger, slide rule, and the rest.
They used to shiver in their shoes;
He'd deal with them just as he chose.

I'm speaking now of early days
Before he fell on evil ways,
When scarcely any of those letters
By which we recognise our betters
Adorned his name: a mere "C.E."
And perhaps an *M.A.O.F.B.*
(Indeed, he hadn't paid his "sub."
As member of the Mustard Club.)

But speedily the craving grew
To add initials to those few
Which once had been his modest pride.
He sought for honours far and wide;
He grabbed a wandering O.B.E.,
And bought a Hollywood degree;
He even added to his hoard
The index letters of his Ford.

His business card became too small
To accommodate it all,
And so he had a folder printed,
And to his clients more than hinted
That they'd find it well worth while
To mount it in a loose-leaf file:
"I haven't half exhausted yet
The glories of the alphabet!"

With each accretion to his name
Electrons shy more shy became;
They shrank abashed, they hardly dared
To show themselves. And when they heard
That he'd become *Sir* Hildebrand,
They said: "It's more than we can stand.
We cannot face this super-man;
His title, and his caravan
Of dazzling letters strike us dumb;
His trailing clouds of glory numb
Our every function!"

And the fact is
The great de Vere has lost his practice:
When he appears the news goes round,
And all electrons go to ground;
Of all his tests there's not one worth
A guinea—for they're all *Dead Earth!*

H.R.T.

Ceiling Fans.

The comparison of ceiling fans on the basis of air displacement is useless unless the measurements have been made under similar conditions. There appear to be practically no data published dealing with such conditions; experiments described in a paper by Messrs. E. Hughes and W. G. White, published in the March issue of the I.E.E. *Journal*, were carried out at the Municipal Technical College, Brighton, for the purpose of determining the factors upon which the measured volume of air depends. In the Electrical Review of January 18th, 1924, Mr. R. O. Kapp gives curves of air velocity measured in four directions at right angles to one another, and suggests that more consistent measurements of air velocity can be obtained by placing the fan at the top of a metal chimney 15 ft. square and 10 ft. high, having an opening about 2 ft. high at the lower end to allow circulation of the air. Such an arrangement, Messrs. Hughes and White maintain, has the disadvantage that the fan is working under artificial conditions and is not allowed to set up the kind of draught that may be peculiar to the design of its blades; the screen eliminates any induced draught, whereas the latter forms a large percentage of the total volume of air circulating normally. The conclusions arrived at may be stated as follows:—

(1) The air velocity decreases rapidly on the outskirts of the draught cone, especially immediately below the blade tips.

(2) The further the plane of observation below the fan, (*a*) the flatter is the velocity curve; (*b*) the nearer to the axis of the fan is the point of maximum velocity; (*c*) the more difficult it is to determine reliably the air velocity on the outskirts of the draught cone, and (*d*) the greater is the volume of air in circulation.

(3) A plane 3 ft. below the blades is the most representative position for taking air measurements.

(4) Calculations from velocities measured at 4-in. radial intervals have been found satisfactory, especially at a distance of 3 ft. below the fan; this distance is recommended as the largest interval consistent with reasonable accuracy.

(5) Owing to the rapidity with which the velocity falls off under the blade tips, it is important to have a rigid support for the anemometer so that its position may be set accurately.

(6) The volume of air circulated by a given fan is greater in a small room than in a large one; and it is suggested that a clear floor area extending 10 ft. in every direction from the axis of the fan should be provided.

(7) The draught is symmetrical in all directions so long as the space in the neighbourhood around the fan is free from unsymmetrical obstables.

(8) The air volume measured 3 ft. below a fan is independent of the height of the blades above the floor so long as that distance is not less than 8 ft.

(9) When the fan is close to the ceiling, there is a reduction in the air volume; but there is no gain from increasing the distance between the blades and the point of support beyond 3 ft.

(10) For a given fan speed, the volume of air is greater the higher the temperature of the room; consequently the room temperature at which air measurements have been made should always be specified.

(11) The quantity of air delivered by a ceiling fan is approximately proportional to the speed, but the spread of the draught is greater the higher the speed.

(12) If the fan be designed for its best operation at about its rated voltage and frequency, an appreciable departure from these values has very little effect upon the efficiency.

(13) With certain types of blades, an improvement in the efficiency can be obtained by tilting the blades upwards; this alteration, however, has the drawback of detracting from the æsthetic appearance of the fan.

Galvanised-Steel as Neutral Conductor.

An interesting problem in connection with the supply of electricity in rural areas has recently been introduced in France, where a syndicate of communes in the West decided to use galvanised-steel for the neutral wire of a l.p. distribution system. One supply undertaking refused to supply the system and the matter was brought to the notice of the local electricity supply control authorities, and, in turn, the French Ministry of Public Works. The opposition of the electricity supply undertaking was of a technical character, it being urged that the security and safety of the distribution system rested entirely on the continuity of the neutral wire, and that with galvanised-steel wire, it being liable to rust after several years' use, there was a risk of fracture at any of the branching points which it would be impossible to detect. The local authorities pointed out that the specification of the installation provided for many "earths" of the neutral wire, and that the regulations required that in all interior installations the neutral should be connected to earth. Under such conditions the accidental rupture of the neutral at one point ought not to bring the distribution system into danger, seeing that there would be numerous earth connections on both sides of the fractured wire. The Ministry adopted the view of the local authorities, pointing out that experience with galvanised-steel wire, particularly in connection with the French telegraph system, and for the past twenty years in rural distribution systems in Alsace-Lorraine, had revealed no troubles that would justify a decision to prohibit the use of such wire. The Ministry therefore saw no reason to reject the proposal to use galvanised-steel wire in the rural system in question, particularly for the neutral line in star-connected three-phase systems. At the same time, the local electricity supply control authorities are to assure themselves that everything will be done from the technical point of view in order to reduce the risk of fracture to a minimum. The decision is regarded as one of considerable importance in connection with the large amount of work that is at present in hand in France in extending the supply of electricity in rural areas, the limited demand necessitating that the cost of installation shall be kept down to a minimum.

New Method of Studying Radio-Waves.

At a meeting of the Académie des Sciences, General Ferrie explained a method of studying the propagation of radio-telegraph waves at a height, which has been invented by MM. Idrac and Bureau. The method consists in suspending a small emission apparatus from two balloons at a height of 14 kilometres.—*Reuter's Trade Service* (Paris).

A Heat-Resisting Porcelain.

Commerce Reports states that a new ceramic material, related to porcelain, that is not damaged by temperature changes, is said to have been developed by F. Behneke, of Lubeck, Handelshof. The inventor states that the material can be heated to 700 deg. *F.*, and immediately immersed in cold water without cracking. It has been stated that it will be extensively used in electric heating devices. The cost of production is but little more than for porcelain. Patents have been applied for throughout the world.

National Association of Supervising Electricians.

Change of Name.—From to-day the new name of the above Association will be the Association of Supervising Electrical Engineers. The new name will more nearly reflect the qualifications and experience of the members and their duties, while it is generally agreed that the designation "electrician" as used in the early days has lost its significance. New rules will also operate from April 1st, under which the qualifications for membership have been strengthened, the number of years' experience for supervising and commercial engineers and foremen having been increased, in the former case to ten years and in the latter case to eight years, with minimum ages of 26 and 24 years respectively. Subscriptions have been reduced and will include the Association's monthly journal. The address of the Association and telephone number remain unchanged.

Meter Engineers' Technical Association.

Annual Meeting.—The first annual general meeting of this Association was held at the Lighting Service Bureau, London, on March 24th, when the result of the ballot for the 1927-28 Council was announced, and the following declared elected:—Messrs. W. E. C. Alliss, E. Fawssett, C. H. W. Gerhardi, J. T. Haynes, E. W. Hill, F. C. Knowles, G. D. Malcolm, E. Mathews, A. Middleton, and G. F. Shotter. Messrs C. B. Green and W. Casson were elected auditors for the ensuing year, and revised rules were confirmed by the meeting.

The hon. treasurer's report for the year ended December 31st, 1926, was adopted; general meetings during the 1927-28 session will be held on Fridays in the fourth week of the month, and commence at 7 p.m. A short, but interesting, discussion on matters arising out of the papers read during the past session was opened by the President, during which many of the members present submitted their views on the various subjects dealt with.

Institution Notes.

Institution of Electrical Engineers.

Informal Meeting.—At the informal meeting held on March 21st, Mr. R. J. Mitchell opened a discussion on "Domestic Electrical Refrigeration," Mr. J. W. Beauchamp being in the chair. Mr. Mitchell showed a number of lantern slides, which illustrated the construction of a popular electrical refrigerator, which he described in detail; and he also briefly outlined the principles of other types. The Act which came into operation at the beginning of this year, prohibiting the use of preservatives in foods, created a huge field for the sale of refrigerating machines, and he suggested that the possibilities of commercial and domestic refrigeration presented a very bright prospect for the electricity supply industry.

North-Midland Centre.—The joint delegation dinner will take place on April 4th; early application for tickets is requested. The annual general meeting will be held on April 5th, at the Hotel Metropole, Leeds, after which there will be a smoking concert. The ballot list for officers and Committee is as follows:—*Chairman*: J. Edwin Storr; *Vice-Chairmen*: F. S. G. Hinings, C. Nelson Hefford; *Hon. Secretary*: H. Cecil Fraser; *Committee* (five vacancies): H. G. Fraser, W. P. Bramwell, P. Maxwell, S. R. Siviour, W. F. Mylan, L. H. Roberts, C. A. Gillin, A. H. Horsfield.

The Institute of Metals.

The Institute expects to register its 2,000th member before celebrating its 20th anniversary next spring. The total is already over 1,800. The next election of members is due to take place on April 13th. Persons then elected will have membership till June 30th, 1928, and an extra copy of the *Journal* for one year's subscription.

The Institute has decided to compile a list of "trade alloys," together with particulars of their composition and uses, as well as the names of manufacturers or agents in Great Britain. Persons interested are invited to forward such particulars to the Secretary.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.

It was announced this week that Mr. Archibald Page has been appointed chief engineer and manager to the Central Electricity Board.

We give, accompanying these notes, photographs of Mr. J. R. Brooke, who, as announced in our last issue, has been

Elliott & Fry] *[London.*

Mr. J. R. Brooke, C.B.,
Secretary to the Central Electricity Board.

appointed to be Secretary to the Central Electricity Board, also of Mr. D. W. Coates, who has been appointed the Board's accountant. Mr. Brooke is the late Permanent Secretary

Elliott & Fry] *[London.*

Mr. D. W. Coates, C.B.E.,
Accountant to the Central Electricity Board.

of the Ministry of Transport, and Mr. D. W. Coates is a member of the firm of D. W. Coates, West, Grimwood & Co., chartered accountants. He was formerly Financial Secretary

of the Coal Mines Department and Chairman of the Financial Board of the Department. The offices of the Board will be at Trafalgar Buildings, 1, Charing Cross, S.W.1. The Minister of Transport has appointed Mr. C. W. Hurcomb, C.B., C.B.E., Principal Assistant Secretary of the Ministry of Transport, to be Permanent Secretary of the Ministry of Transport in Mr. Brooke's place.

Mr. Neil McLean, chief assistant engineer at the Harrogate Electricity Works, who is stated to have been in the service of the Corporation nearly 30 years, has been appointed borough electrical engineer, in succession to Mr. G. Wilkinson.

Mr. H. T. Tizard, C.B., A.F.C., F.R.S., has been appointed to be Secretary to the Committee of the Privy Council for Scientific and Industrial Research on the retirement of Sir H. Frank Heath, K.C.B., from that office on June 1st next.

The directors and staff of the United Alkali Co., Ltd., entertained their chairman, Sir Max Muspratt, to dinner at Liverpool last week, and presented him with his portrait in oils.

At a recent smoking concert Mr. W. Higgins was presented by his colleagues in the Superintending Electrical Engineers' Department with a gold watch upon his retirement after 46 years' service in Devonport Dockyard.

Increased sales of electric cooking and heating, &c., appliances have led the Birkenhead Town Council to appoint Mrs. McCullough, formerly a demonstrator with the General Electric Co., Ltd., Liverpool, as demonstrator at the showrooms.

Mr. George J. Hollyer, assistant electrical engineer to the Walthamstow Urban District Council, has been appointed borough electrical engineer and manager at Loughborough at £750 per annum, and will take up his new duties towards the end of April.

Mr. Emil Braathan, A.M.I.E.E., draughtsman and technical assistant at the Stepney electricity works, has been presented with an oak timepiece by his colleagues upon his leaving—after 13 years' service—to take up the position of switchgear engineer at the Hackney electricity works. The presentation was made by Mr. W. Young (resident engineer).

A Manchester paper states that Mr. S. J. Watson, chief engineer and manager of the Salford Electricity Department, has accepted the position of chief engineer to the London and Home Counties Joint Electricity Authority. "The resignation of Mr. Watson, who has been at Salford over four years, will probably be submitted to the Electricity Committee this week."

Mr. L. J. N. Kirkby, of Birmingham, has been appointed assistant mains superintendent to Chester Corporation Electricity Department.

The application of Mr. P. P. Wheelwright, borough electrical engineer at Blackburn for a reconsideration of his salary, has been withdrawn.

Mr. H. A. G. Howse, of the engineering department of Standard Telephones & Cables, Ltd., only son of Lady Howse, and the late Sir Henry Howse, was married at Sidcup on March 26th to Miss Elizabeth Helen Clark, only daughter of Dr. James and Mrs. Clark. Mr. Howse was presented with a collection of table silver by his colleagues in the engineering department.

We are informed that Mr. A. W. Empson, who relinquished the management of Empson Centrifugals, Ltd., in June last, has now resigned his directorship. His address is 46, Christchurch Avenue, N.W.6. ('Phone: "Willesden 4269.")

Obituary.—Mr. G. Clay.—The death occurred on March 14th of Mr. Gordon Clay, late secretary-general of the Egyptian State telegraphs and telephones.

Mr. W. R. Mickelwright.—We regret to learn of the death of Mr. W. R. Mickelwright, A.M.I.E.E., managing director of Mickelwright, Ltd., at the age of 42.

Wills.—The late Sir Frederick Green, one of the founders of the "Orient Line" and a director of the United River Plate Telephone Co., Ltd., left £338,066 gross and £321,875 net personalty.

The late Mr. T. W. Broadbent, of Huddersfield, left £5,591 gross and £2,248 net personalty.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Young Accumulator Co., Ltd.—Private company. Registered March 23rd. Capital, £6,000 in 4,000 10 per cent. cumulative preference shares of £1 each and 40,000 ordinary shares of 1s. each. Objects: To carry on the business of electricians, electrical engineers, manufacturers of and dealers in electrical appliances, apparatus, novelties and specialities, &c. The subscribers (each with one preference share) are:—S. V. Spear, 3, The Close, Hatfield, Herts, insurance broker, A. H. Shaw, 47c, Lewisham Hill, Lewisham, S.E.13, company secretary. The first directors are Sir Frederick W. Young, K.B.E., Lt.-Col. Warwick Wright, D.S.O., T. E. Eachus, O.B.E., S. V. Spear, and S. A. Bayford, D.S.C. (addresses not stated). The said Sir Frederick W. Young shall be permanent chairman and managing director so long as he holds 1,000 ordinary shares. In the event of his resigning office, Sir Frederick W. Young & Co., Ltd., may appoint his successor in office. Qualification of ordinary directors, £10 shares. Managers: Sir Frederick W. Young & Co., Ltd. Secretary: A. H. Shaw. Solicitors: Constant & Constant, Exchange Chambers, 24, St. Mary Axe, E.C.3. Registered office: 101, Leadenhall Street, E.C.3.

Power Holdings, Ltd.—Public company. Registered March 24th. Capital, £100 in 60 7 per cent. cumulative participating preference shares of £1 and 80 ordinary shares of 10s. each. The objects are to form, promote, subsidise and assist companies, syndicates, and partnerships of all kinds, and particularly companies, syndicates and partnerships, to carry on or carrying on all or any of the businesses of electrical and general engineers, and manufacturers and maintainers of plant for the generation, accumulation, transmission and supply of electrical energy for light, heat, power or otherwise; to carry on business as bankers, capitalists, financiers, concessionaires, &c. The minimum cash subscription is seven shares. The subscribers (each with one ordinary share) are:—W. J. Yeoman, 244, Lordship Lane, East Dulwich, S.E.22, clerk; A. J. Clark, 114, Barrington Road, Crouch End, N.8, clerk; and five other clerks. Directors' qualification, £500. Solicitors: Ashurst, Morris, Crisp & Co., 17, Throgmorton Avenue, E.C.

Griffin, Harding & Bryant, Ltd.—Private company. Registered March 22nd. Capital, £3,500 in £1 shares (2,000 preference, 1,400 ordinary and 100 founders'). The objects are to adopt an agreement with T. C. Harding, H. F. Griffin, W. Griffin, and W. C. Bryant, and to carry on the business of electrical and radio-telegraphy engineers formerly carried on by them at 1, Park Lane, Swindon. The permanent directors are:—T. C. Harding, 12, Park Lane, Swindon (chairman); H. F. Griffin, 126, Dean Street, Swindon; W. Griffin, 49, York Road, Swindon; W. C. Bryant, 32, Westcott Place, Swindon. All are described as electrical and radio-telephony engineers. Qualification of permanent directors, 100 ordinary shares; of other directors, £1. Secretary: W. Griffin. Solicitors: Morrison and Masters, Swindon. Registered office: 1, Park Lane, Swindon.

Signs of the Times, Ltd.—Private company. Registered March 16th. Capital, £1,000 in £1 shares. Objects: To acquire the business of an electrical advertising expert and installation contractor carried on by A. Longfield, at 150, Moor Street, Birmingham, as "The Signs of the Times Company." The first directors are:—A Longfield, The Hollies, Walmley Road, Penns, Warwickshire, manufacturer; J. H. Dwyer, The Mount, Lapworth, Warwickshire, electrical engineer. Qualification, 50 shares. Registered office: 150, Moor Street, Birmingham.

London and Midland Manufacturing Co., Ltd.—Private company. Registered March 21st. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in wireless apparatus and component parts thereof, electrical engineers, &c. The first directors are:—C. S. Simpson, 86, Woodlands Avenue, Church End, Finchley, N.3, export manager; and G. B. Harold, The Very House, Worplesdon, Surrey, clerk. Qualification, one share. Solicitors: John Hands & Son, 99, Gresham Street, E.C.2.

Warner (Control), Ltd.—Private company. Registered March 18th. Capital, £100 in £1 shares. Objects: To carry on the business of electrical, mechanical and general engineers and contractors, manufacturers and sellers of transformers, radiators, dynamos, motors, and radio instruments, &c. The life directors are:—G. W. Parr, Loampit Hill House, Lewisham, S.E.13, engineer (chairman); E. J. Walker, 3, Chudleigh Road, Brockley, S.E.4, engineer. Solicitors: Rundle and Hobrow, 9, Ironmonger Lane, E.C. Registered office: 10, Bush Lane, Cannon Street, E.C.4.

Warner Trust, Ltd.—Private company. Registered March 18th. Capital, £1,000 in £1 shares. Objects: To carry on the business of mechanical, electrical, chemical, radio, hydraulic, automobile, and general engineers and contractors, &c. The life directors, solicitors, and registered office are the same as given for Warner (Control), Ltd., above.

Gordon Baynton, Ltd.—Private company. Registered March 21st. Capital, £2,000 in £1 shares (700 7½ per cent. cumulative preference and 1,300 ordinary). To acquire the business formerly carried on by the late C. S. Baynton, at 133, New Street, Birmingham, to adopt an agreement with G. Baynton, and to carry on the business of manufacturers of and dealers in instruments for the receiving or transmitting of sounds and signals by telephony or telegraphy by wireless methods or otherwise, electricians, engineers, &c. The subscribers (each with one share) are:—C. W. G. Baynton, 197, Russell Road, Mosley, Birmingham, wireless dealer; H. J. Gittoes, 14, Temple Street, Birmingham, C.A. C. W. G. Baynton is the first and managing director. Solicitors: Wallace Robinson & Morgan, 63, Temple Row, Birmingham. Registered office: 133, New Street, Birmingham.

Martin's, Electricians, Ltd.—Private company. Registered in Edinburgh March 23rd. Capital, £4,000 in 3,700 preferred ordinary shares of £1 and 6,000 deferred ordinary shares of 1s. each. Objects:—To carry on the business of electricians, mechanical and general engineers, dealers in wireless apparatus, &c. The first directors are:—J. Bogie, 15, Swan Road, Kirkcaldy, outfitter; H. W. Mickel, 4, Balwearie Road, Kirkcaldy, stockbroker; W. Gibson, 66, Ava Street, Kirkcaldy, electrical engineer; R. M. McPherson, 23, David Street, Kirkcaldy, stockbroker. Qualification, 100 shares. Secretary: H. W. Mickel. Registered office: 302, High Street, Kirkcaldy.

Official Returns of Electrical Companies.

Hammersley Bros., Ltd.—Issue on March 2nd, 1927, of £100 debentures, part of a series already registered.

Century Cables, Ltd.—Deposit on March 11th, 1927, of deeds of land and factory, buildings in Station Road, Addlestone, to secure all moneys due or to become due from the company to Lloyd's Bank, Ltd., not exceeding £10,000.

Nox Electric Lamp Co., Ltd.—Satisfaction in full on March 1st, 1927, of debenture dated May 11th, 1923, securing £662 13s. 4d.

Particulars filed of £15,000 debentures authorised February 24th, 1927, charged on the company's undertaking and property, present and future, the amount of the present issue being £6,000.

J. & W. B. Smith, Ltd.—Satisfaction in full on March 10th, 1927, of debenture dated August 14th, 1924, securing £15,000.

Yale Electric Power Co., Ltd.—Capital, £20,000 in 3,300 preference shares of £1 each and 668 ordinary shares of £25 each. Return dated December 8th, 1926. 300 preference and 668 ordinary shares taken up. £15,300 paid. £1,700 considered as paid. Mortgages and charges, £6,000 debentures to cover day to day bank overdraft at December 8th, 1926, £5,950.

H. Kaplan, Ltd.—Capital, £5,000 in £1 shares. Return dated October 29th, 1926 (filed February 18th, 1927). 4,000 shares taken up. £3 paid. £3,997 considered as paid. Mortgages and charges, nil.

Radio Experts, Ltd.—Capital, £500 in £1 shares. Return dated December 18th, 1926. 200 shares taken up. £200 paid. Mortgages and charges, nil.

Roddis Electric, Ltd.—Capital, £2,200 in 2,000 preference shares of £1 each and 4,000 ordinary shares of 1s. each. Return dated December 31st, 1926 (filed January 22nd, 1927). 1,079 preference and 4,000 ordinary shares taken up. £904 paid on 904 preference shares. £375 considered as paid on 175 preference and 4,000 ordinary shares. Mortgages and charges, nil.

Electracts, Ltd.—W. B. Pearson, of 5, John Street, Bedford Row, W.C.1, was appointed receiver and manager on March 5th, 1927, under powers contained in debenture dated November 25th, 1926.

Midget Lamp Co. (1924), Ltd.—Capital, £2,000 in £1 shares. Return dated November 22nd, 1926. All shares taken up. £2,000 paid. Mortgages and charges, £500.

A. C. Hodson, Ltd.—Capital, £3,000 in £1 shares. Return dated December 31st, 1926 (filed February 19th, 1927). 1,250 shares taken up. £1,250 paid. Mortgages and charges, nil.

Westminster Engineering Co., Ltd.—Capital, £25,500 in 13,000 ordinary and 12,500 preference shares of £1 each. Return dated November 15th (filed December 28th), 1926. 8,560 ordinary and 9,279 preference shares taken up. £14 039 paid on 6,560 ordinary and 7,479 preference shares. £3,800 considered as paid on 2,000 ordinary and 1,800 preference shares. Mortgages and charges, £3,000.

Bury Lighting and Heating Co., Ltd.—Capital, £1,000 in £1 shares. Return dated December 31st, 1926 (filed February 19th, 1927). All shares taken up. 18s. per share called up. £832 10s. paid, leaving £67 10s. in arrears. Mortgages and charges, nil.

Secar, Scott & Co., Ltd.—A. J. Kirby, of 7, Drapers' Gardens, E.C., ceased to act as receiver or manager on February 26th, 1927.

City Notes.

Midland Electric Corporation for Power Distribution, Ltd.

In the absence through ill-health of Mr. J. Taylor, chairman, Mr. D. Sinclair presided at the annual meeting last week, and in moving the adoption of the report (*vide* Electrical Review, March 18th, p. 444) expressed the company's regret at the death of the vice-chairman, Sir J. S. Harmood-Banner. After reviewing the accounts, he said that the profit for the year had been reduced by nearly £10,000 by the coal dispute; that was the second time such a disturbance had occurred within six years. It was not until February this year that the sales of energy reached the level of the corresponding month of last year. The company had maintained a supply throughout the whole period. It had been handicapped by the high price and low quality of the coal which it was obliged to use, and only a part of the additional cost had been recovered from consumers. The number of consumers connected continued to increase, and a considerable increase in output was anticipated when trade recovered. It was hoped that the company's generating station would be handed over to the West Midlands Joint Authority during the current year; the company would then purchase its energy in bulk from the Authority (on which it had five representatives). The Authority was proceeding at once with the interconnection of the stations in its area, and plans had been laid for the erection of a large new station near Ironbridge. The latter, however, would not be available for at least three years. To meet the rapidly growing demand, the Authority had ordered 10,000 kW of plant for Walsall and proposed to install a further 10,000 kW at the company's Ocker Hill station. The report and accounts were adopted.

Mersey Power Co., Ltd.

In the course of his speech at the recent annual meeting of the Salt Union, Ltd., the chairman (Mr. G. H. Cox) dealt at some length with the company's chief subsidiary, the Mersey Power Co., Ltd. He said that after six years the company had paid a dividend of 5 per cent. When the company first started it utilised waste heat from a vacuum salt plant and paid handsome dividends. During the war the Government persuaded them to extend their facilities by the employment of steam plant. Since then growth had been rapid and the power station now had a plant capable of providing a continuous load of 24,000 kW, with necessary spare plant. The output had increased from 45,725,000 kWh in 1925 to 50,760,000 kWh last year. During the period of rapid expansion the payment of dividends was impossible, but the undertaking was now in the front rank and the sales and revenue were increasing. Referring to the Electricity (Supply) Act, 1926 Mr. Cox said that it placed very wide powers in the hands of those appointed to carry out its provisions, and unless those powers were wisely used the industry would be hampered rather than helped.

City of London Electric Lighting Co., Ltd.

In their report for 1926 the directors state that they regret that they are still unable to present a balance sheet definitely showing the financial position of the company under the London Electricity (No. 1) Act, 1925, as the L.C.C. has not yet approved the standard price submitted by the company. The directors are only able to show the result of the past year's working so far as it is known, and after paying the standard dividend the balance of the net revenue is held in suspense. After adjustment the capital expenditure at June 30th, 1925, is put at £2,634,514; the amount of free reserves available for capitalisation at December 31st, 1925, was £498,444. Of the latter sum £400,000 has been capitalised and issued as ordinary shares. The standard rate of dividend is now 10 per cent., and this will be paid in two equal half-yearly instalments. During the year considerable price modifications in favour of the consumers were made by the company. Meeting: April 6th.

Metropolitan-Vickers Electrical Co., Ltd.

The report for the past year records a profit of £273,646, and after meeting debenture charges and depreciation (£52,517) and transferring £25,000 to general reserve, there remains £154,674, to which is added £95,058 brought forward, making £249,732. A dividend of 8 per cent. is being paid on the ordinary shares, and £98,052 is carried forward. In spite of the industrial situation, the output last year was only slightly less than that of 1925; this is considered satisfactory. The company secured important contracts, both at home and abroad, and the volume of orders in hand at the beginning of

the year was sufficient, with new orders which will be obtained, to guarantee employment for the factories during the year. The reports mentions the resignations of Sir Vincent Caillard, Mr. L. Chandler, and Mr. Douglas Vickers from the board and the appointment of Sir David Yule, Sir Mark Jenkinson, and Messrs. A. McKinstry and G. E. Bailey as directors. The meeting is to be held on April 5th.

Metropolitan Electric Supply Co., Ltd.

The report for the past year states that since January 1st, 1926, the company has taken its supply in bulk from the London Power Co., which has taken over the Willesden station. The year's accounts are therefore not comparable with those of previous years. The gross revenue was £789,830, and the amount at the credit of net revenue account £253,055. To this is added interest and dividends from investments and allied undertakings making £328,713. After meeting the preference and standard ordinary dividends £13,377 is carried forward. The report recalls that £500,000 of the reserves was capitalised in December last and distributed to the ordinary shareholders in the ratio of one to each two shares held. The meeting was to be held on Wednesday last.

Stock Exchange Notices.

Dealings in the following have been specially allowed by the Committee under Rule 159.

Bell Brothers (Manchester, 1927), Ltd.—100,000 7½ per cent. cumulative participating preference shares of £1 each, 10s. paid, Nos. 1 to 100,000. 500,000 ordinary shares of 1s. each fully paid, Nos. 1 to 500,000.

Brush Electrical Engineering Co., Ltd.—6,558 ordinary shares of £1 each fully paid, Nos. 458,564 to 465,121.

Aluminium Corporation, Ltd.—10,007 new preference shares of £1 each fully paid, Nos. 130,861 to 140,867 (ranking for dividend from various dates).

Bath Electric Tramways, Ltd.

At the annual meeting on March 24th, the chairman (Mr. E. H. R. Trenow) said that at the beginning of the past year substantial progress was shown, but then the general strike and the mining dispute came and affected the company's business, and the net revenue was reduced by £1,981. On account of that the directors considered it prudent to limit the preferred ordinary dividend to 2½ per cent. They thought that when next the company applied for permission to increase fares it would have a good case to present to the Ministry of Transport. The receipts for the current year were, so far, below those for 1926, but that was due to factors which were being removed and was not regarded as of serious moment.

Richmond (Surrey) Electric Light and Power Co., Ltd.

The report for the past year shows that the capital expenditure was increased by £19,572 to £268,115. The amount available (including £2,630 brought forward) is £39,752. Out of this £1,351 is put to sinking fund, £10,000 to depreciation and renewals reserve, £750 to taxation reserve, and £7,000 to general reserve. The directors propose a final dividend of 5 per cent. on the ordinary shares, making 9 per cent. for the year, leaving £2,652 to be carried forward. The amount of energy sold rose from 2,522,274 to 2,713,533 kWh. The report records the death of Sir James W. Szlumper, a director. Meeting: April 7th.

South London Electric Supply Corporation, Ltd.

The amount carried forward from the last accounts was transferred to reserves for capitalisation. The net revenue for the year was £115,291, and from it the following payments are made:—Loan and debenture interest, £6,573; contingency fund, £2,620; taxation reserve, £11,500; sinking funds, £16 901. An interim dividend of 5 per cent. was paid on 260,000 ordinary shares; the number has since been increased to 494,000, by a bonus issue, and a dividend of £5 17s. 6d. per cent. is recommended on these. A balance of £33,874 is carried forward. The amount of energy sold rose from 14,515,019 to 15,202,623 kWh. Meeting: April 5th.

South Metropolitan Electric Light and Power Co., Ltd.

The 1926 revenue account shows a credit balance of £179,884; to this is added £4,011 brought forward, making £183.895. From this debenture interest is paid, £3,807 is carried to depreciation fund, £16,000 to taxation reserve, and £32,085 to depreciation reserve. An interim dividend of 5 per cent. was paid on 250,000 ordinary shares. Since then the number of ordinary shares has been increased to 600,000 by a bonus issue and the dividend on these is 6 per cent. A balance of £52.419 is carried forward. The energy sold increased from 29,653,143 to 30,599,681 kWh. Meeting: April 5th.

Windermere and District Electricity Supply Co., Ltd.

The balance available for the past year (including £1,693 brought forward, and interest and dividends received) is £10,003. Out of this debenture interest is paid. £250 is written off the free-wiring account, £2,000 transferred to depreciation reserve, and £2,000 to reserve fund. The total dividend on the 6 per cent. cumulative preference shares is 8½ per cent., clearing arrears to April 30th, 1915. The 7½ per cent. preference dividend is paid and £2,240 is carried forward.

Keswick Electric Light Co., Ltd.

Out of an available balance of £2,133, £1,500 is devoted to writing off certain sums and reserves, and a dividend of 5 per cent. is paid on the ordinary shares, leaving £222 to be carried forward.

Yorkshire (West Riding) Electric Tramways Co., Ltd.

Sir George E. Leon, Bt. (chairman) presided at the annual meeting on March 23rd, and in presenting the report and accounts (*vide* our last issue, p. 487) referred to the death of his father, the late chairman (Sir Herbert S. Leon). The coal dispute had substantially reduced the company's revenue, and a further adverse factor had been motor-'bus competition. Until the licensing authorities took steps with regard to the latter they could not look forward to the future with any confidence. Nevertheless, the company would be able to weather the storm; already there were signs of a dawning reasonableness among their competitors. They realised that eventually tramways might be superseded by omnibuses, and they were accordingly increasing their motor-'bus business in preparation for that day. The report and accounts were adopted.

London Electric Supply Corporation, Ltd.

In common with the other London companies, this company prefaces its report with the announcement that the accounts have been prepared in accordance with the London Electricity (No. 2) Act, 1925. The profit for the past year was £200,079 (against £202,426). After meeting debenture interest and sinking fund contributions the available balance is £102,677. The preference and standard ordinary dividends are paid and a balance of £1,784 is carried forward. The amount of energy sold rose from 90,905,284 kWh to 131,873,891 kWh. The average receipts per kWh fell from 1.22d. to 1.11d. The meeting was to be held yesterday (Thursday).

Bournemouth and Poole Electricity Supply Co., Ltd.

The balance on the revenue account for 1926 was £141,418, and to this is added £10,076 brought forward, making £151,494. After meeting the debenture interest and special redemption fund payment the reserves receive the following sums:—Depreciation, renewals, &c., £25.000; taxation, £5 000; general, £50,000. A final ordinary dividend of 5½ per cent. is recommended, making 10 per cent. for the year, less tax, together with a bonus of 4 per cent., free of tax. This leaves £9.376 to be carried forward. The sales of energy rose from 9,715,129 to 10,656,342 kWh. Meeting: April 7th.

Para Electric Railways and Lighting Co., Ltd.

The gross receipts for 1926 were £203,902, as compared with £144,015 in 1925, and the net revenue rose from £60,030 to £71,436. After meeting debenture charges and other expenses, there was a credit balance of £27,600. The accrued debit balance is cleared off, £10,000 is transferred to reserve, and £7,785 is carried forward. The improved position is said to be due to the rise in the value of the milreis and the revision of fares which was put into force. Meeting: April 5th.

Kensington and Knightsbridge Electric Lighting Co., Ltd.

The report for the year ended December 31st last states that the accounts have been prepared in accordance with the London Electricity (No. 2) Act, 1925. The connections increased from 25.353 to 27,499 kW, and the energy sold amounted to 12,315.290 kWh. The net profit for the year was £31,259, and after paying the preference and standard ordinary dividends, a balance of £2,134 is carried forward. The meeting was to be held yesterday (Thursday).

Costa Rica Electric Light and Traction Co., Ltd.

The report for 1926 records net earnings in Costa Rica of £27,611 (against £27,808), and the net profit is £9,500 (against £8,906). The balance of net profit has again been placed to the depreciation and renewals account. During the year extensions costing about £30,000 were carried out, and it is anticipated that increased business will result. The meeting was to be held yesterday (Thursday).

Egham and Staines Electricity Co., Ltd.

The net profit for 1926 was £20,247, and after meeting debenture interest, preference dividend, &c., it is proposed to pay a dividend of 5 per cent. on the ordinary shares. During the year over £42,000 was spent on distributors and services; the sale of energy is growing and the extensions made are being rapidly developed. Meeting: April 4th.

Anglo-Portuguese Telephone Co., Ltd.

The report for the past year records a gross income of £166,567, a gross profit of £52,055, and a balance available of £60,364 (including £27,591 brought forward). A final dividend of 4 per cent. is to be paid, making 7 per cent. for the year (against *nil* for 1925) and £20.319 is carried forward. The annual meeting was held on Monday.

Durelco, Ltd.

The report for the year ended September 30th last shows a profit of £155, after writing off a part of the debenture expenses. The combined profits of the company's subsidiaries, before providing for debenture interest, &c., was over £19,000. The total standing to the credit of profit and loss accounts of subsidiaries is £41,740.

North British Aluminium Co., Ltd.

The directors state that the construction of the Lochaber hydro-electric works was retarded last year by the mining dispute, but satisfactory progress is now being made. The annual meeting was to be held yesterday (Thursday).

German Companies.

The *German Telephone Works and Cable Industry Co.*, Berlin, states that larger orders were received in 1926 from the Reich postal authorities for the telephone factory, particularly for automatic installations, while business in individual apparatus and private telephone installations again showed an increase. The greatest high-frequency network in the world is in hand for Finland. The cable factory was satisfactorily occupied. The dividend is 6 per cent. out of net profits of 509,000 marks, as in 1925.

The *Wolfram Lamp Company*, Augsburg, which is closely associated with the Osram Company, reports net profits of 68,000 marks for 1926, as against 62,000 marks in the previous year, the rate of dividend being 10 per cent., as in 1925. At the recent meeting it was mentioned that in the second half of last year the company changed over exclusively to the manufacture of the "N" lamps (new "Osram" lamps), and that the present course of business is satisfactory.

Brown, Boveri & Co., Baden, report a net profit for last year of £51,417, as compared with £43,025 in 1925. Although in the meantime the capital of the concern has been increased from £250,000 to £750,000, the dividend is being raised from 7 per cent. to 8 per cent.

The *Electricity Supply Company*, Berlin, reports net profits of 2,300,000 marks, as compared with 2,080,000 marks in 1925. The dividend is to be raised from 9 to 10 per cent.

The *German Cable Works Company*, Berlin, states that the works were well employed during 1926, and although sale prices reached a very low level, the value of the turnover increased by nearly 50 per cent. over the previous year. Large orders were received from Government departments, and the export trade was also materially greater than in 1925. The accounts show net profits 350,000 marks as against 376,000 marks in 1925, and the dividend remains at 6 per cent.

The *Electro-Works Company*, Berlin, which is now in the possession of the Reich, reports net profits of 5,060,000 marks, as against 5,010,000 marks in 1925, the dividend being maintained at 8 per cent.

French Companies.

A number of French electricity supply undertakings are increasing their capital for plant extension purposes. Thus the capital of the *Société Electrique du Nord-Ouest* is being raised from 56 to 65 million francs; that of the *Société Pyrenéenne l'Energie Electrique* from 30 to 35 million francs; and that of the *Société Union Hydro-Electrique Amoricaine* from 12 to 27 million francs.

Swiss Companies.

The *Schweizerische Gesellschaft für Elektrische Industrie*, of Basle, is declaring a dividend of 8 per cent. on all three classes of shares for the past financial year, as in 1925. A sum of £20,000 is also being placed to special reserve.

The *Oerlikon Accumulator Company* proposes to pay a dividend of 20 per cent. for 1926, as in the previous year. The share capital is to be increased from 2,200,000 to 2,500,000 fr.

Swedish Company.

The *A.B. Elektrolux* reports gross profits of 2,450,000 kr. for 1926, and net profits of 1,018,000, as against 705,000 kr. in 1925. It is proposed to pay a dividend of 10 per cent., as against 8 per cent. in 1925.

British Engine, Boiler and Electrical Insurance Co., Ltd.

An interim dividend of 13s. per share was paid in June last, and after transferring £20,000 to the pension fund, and £10,000 to the contingency fund, there remains a balance of £24,567. The directors recommend a final dividend of 14s. per share.

Parker, Winder & Achurch, Ltd.

The profit for 1926 was £10,407, and to it is added £7,958 brought forward, making £18,365. A final dividend at the rate of 15 per cent. is declared, making 10 per cent. for the year, as for 1925; £5,000 is transferred to reserve, and £9,264 carried forward.

Canadian Light and Power Co.

The report just issued is the first since the company's acquisition by the Shawinigan interests. The revenue was $313,404 gross and $51,716 net. Of the latter sum $32,997 was transferred to sinking fund reserves, and the balance to depletion reserve. The total assets are given as $6,810,987.

Robey & Co., Ltd.

There was a loss of £29,385 during the past year, as compared with a profit of £5,997 in 1925 before meeting debenture interest.

Montreal Light, Heat and Power Co.

A dividend of $0.5 per share has been declared on the common shares for the quarter ended March 31st.

P. & W. Maclellan, Ltd.

The balance to the credit of the profit and loss account for 1926 is £13,608 (against £30,239). The directors state that they cannot recommend the payment of the preference dividend.

Stewarts & Lloyds, Ltd.

The profit for 1926 was £186,911, as compared with £291,119 in 1925. The dividend on the deferred shares is reduced from 7½ to 2½ per cent.

Victoria Falls and Transvaal Power Co., Ltd.

It is reported that the net earnings of the company for the quarter ended December 31st last were £266,311, before providing for taxation.

Direct Spanish Telegraph Co., Ltd.

The board recommends a dividend of 10 per cent. on the ordinary shares, free of tax, for the past year. An interim dividend of 4 per cent. has already been paid.

G. D. Peters & Co., Ltd.

The net profit for the past year was £9,530 (against £7,203). The preference dividend is passed, £12,830 being carried forward.

Tilling-Stevens Motors, Ltd.

The profit for 1926 was reduced from £36,888 to £3,512, and the preference dividend is passed.

Associated Telephone and Telegraph Co.

The usual quarterly dividend of $1.75 per share on the 7 per cent. preferred stock has been declared.

Stocks and Shares.

Monday Evening.

Although business has fallen away to a great extent in the Stock Exchange markets as compared with what it was a month ago, a state of affairs which is deemed to be due to the news from China and the near advent of the Budget, prices are well maintained, and there is a steady flow of investment capital into industrial shares as well as into more gilt-edged securities. In regard to the Budget, there is little doubt but that the uncertainties surrounding its provisions are having the effect of laying a check upon enterprise, or willingness, on the part of those with capital. People want to see how the cat is going to jump before they invest money, or speculate in stocks and shares. It is not anticipated that the electrical industry will be affected in any direct manner. Prices in the manufacturing group are inclined to be heavy, owing to the less optimistic view that is now taken of the next batch of dividends.

The Home Railway market appears to be regaining a little of its past popularity. The public are not anxious to invest money in Home Railway stocks, but prices have reached levels at which they make an appeal to the speculative spirit, and the Undergrounds are doing sufficiently well to warrant the speculative investor taking up Districts and Metropolitans, with Underground £1 shares as a makeweight, so to speak, in the expectation of materially higher prices in two or three years' time. It is generally admitted that some kind of regulation must be imposed for the sake of the travelling public upon transport in London, and this, when it comes, will put a stop to the indiscriminate competition that has barred the way to a proper settlement of the problem. Logically, it is absurd that so much money should be employed in the industry without any return being obtainable from it. Admitting that grave mistakes were made years ago, when the companies were started, the fact remains that the latter have provided, and are still providing, indispensable services, in return for which those people who put up the money to finance them are entitled to some modest income in the shape of dividends. Underground £1 shares are 1s. higher at 16s. 6d.

Most of the London electricity supply companies have now issued their reports, and amongst those which have made their appearance during the past week are Chelsea, Brompton, Charing Cross, London Electric, Metropolitan, and St. James'. The figures are very much what the market had expected them to be, though the Metropolitan has done better than anticipation looked for. The Bournemouth & Poole is repeating its 14 per cent. dividend of last year, though the profit is less than that of a year ago. Richmond (Surrey) Electric Light and Power Company shows an improvement of about £900 at £37,100 in its revenue balance. It will be remembered that the latter company issued, not long ago, a fresh amount of ordinary capital which now ranks for dividend. On the increased capital the dividend is 9 per cent. against 10 per cent. previously. The price of Richmond shares is about 29s. 6d., while Bournemouth & Poole stand at 3 1/32.

It now becomes possible to re-arrange the dividend tables in such manner as will permit the inclusion of the 1926 figures in the majority of cases. There are still some companies that have not announced their figures, but the blanks will be supplied as soon as the companies' declarations are made. As regards the London electricity supply shares, the only com-

pany whose figures cannot yet be included is the Notting Hill. The rest can be set out as follows :—

Company.	Dividend 1926. Per cent.
Brompton & Kensington	8.6275
Charing Cross	8.15
Chelsea	8.875
City of London	10
County of London	7 1/7th
Kensington & Knightsbridge	8
London	8.4285
Metropolitan	8
St. James' & Pall Mall	7.9375
South London	8½
South Metropolitan	8 1/12th
Westminster	8.8

The standard dividend up to and including 1931 on the present increased ordinary share capital is paid by the Brompton, Chelsea, City of London, London, St. James's and Westminster Companies. The Metropolitan's is better than the standard rate, and the South London's 8½ is a shade below the precise 8.5789 per cent., which is the exact standard. To include four places of decimals in the dividend columns of our tables would be as awkward as it would be valueless. Therefore we have given the nearest vulgar fraction to the decimal, without going into minute differences. The yields are calculated, as before, on the basis of the 7 per cent. dividends that will probably rule after 1931. At the risk of being tedious, we would add that in all the London electric supply shares, the actual yields at the present time are higher than those set out in our column, and will continue to be so for the next five years.

South Londons are 1s. higher at 25s. 6d. Midland Electric Corporation Power shares rose ½ to 55s. In the foreign list, Shanghai Electrics receded 1/10 to 37s. 6d. The Shanghai Stock Exchange has taken the unusual course of asking the London Stock Exchange to express its thanks to the British Government for sending troops to protect life and property in that city.

The English Electric report shows that the company made a small profit on trading, but that this was changed into a very unpleasant loss by the various charges. The net profit came to the bagatelle of £10,000, comparing with £195.000 last year and £263,000 in the year before, but interest charges absorb £124,400, and £9,000 was written off expenses of the debenture issue, in addition to which a further £29,500 has to come in as the half-year's preference dividend paid to June, 1926. The deficit carried forward is £78,600. The directors attribute the disappointment to the coal strike and the dislocation of works thereby occasioned. They refer to fierce competition in foreign and colonial markets for heavy electrical and mechanical machinery, but once more the report sounds a note of hopefulness in regard to the future. The price of the preference shares has fallen a shilling to 12s. 6d., and manufacturing shares are dull as a whole. Electric Constructions are lower, and so are Metropolitan-Vickers and India Rubber, though Henleys at 90s. are a little better. British Electric Transformer are a good market, on the resumption of dividends on the ordinary shares with 5 per cent., the first time a dividend has been paid on these for six years. The shares strengthened to 16s. 6d., the preference remaining at about 18s. 9d. The latter receive 10½ per cent. dividend, which includes the six months' arrears due to them. All the arrears have thus been wiped off.

Automatic Telephones are flat at 50s., the 10 per cent. dividend being regarded as anything but encouraging. The yield on the money for some time past has been so trifling as to imply the anticipation of a bonus or share distribution of some kind that would justify the comparatively high figure at which the price ruled. Nothing has happened, however, and this week's drop of 3s. 3d. is the result of selling on the part of the people who are tired of waiting for something better. The current price includes the dividend recently declared. Telephone Manufacturing shares went down to 6s. 6d., but rallied to 7s. International Telephones are two guineas, and the deferred stand at £2.

The Eastern cable quartette is somewhat irregular, Easterns being a point up and Eastern Extensions ¼ down. Marconis are holding their rise at 17s. 6d., and Marconi Marines scored a further improvement at 23s. 9d., Canadians being a firm market at 4s. Interest has been revived in Marconi shares, and a feeling of subdued hopefulness is the principal feature in the situation. The Marine Company paid 7½ per cent. for the last completed year, and an interim dividend of 3¾ per cent. in October, 1926. It is hoped that the final may be 6¼ per cent., to make 10 per cent. for the whole of last year.

British Electric Traction ordinary has receded a point. British Columbia stocks are inclined to be lower. Anglo-Argentines made further improved progress, and Brazilian Tractions have shot up 3 points. The Mexican group is quietly firm. Barcelona Tractions have been moving in consonance with Brazilians, being better at 47. Depression continues to characterise the iron and steel list. Company reports and accounts for 1926 are mostly couched in melancholy vein, as the coal stoppage rendered it inevitable that they would be, and confidence has yet to revive in the outlook for a return to prosperous conditions this year. Rubber shares show hesitation in view of the new electrical treatment said to have been discovered for the lengthening of the life of rubber by giving it a greater resiliency and wearing capacity.

The Electrical Exports of Germany.

Statistics for 1925 and 1926 Compared.

WITH the publication of the monthly returns, for December, and the twelve months of 1926, of the foreign trade of Germany, some interesting information regarding the progress of the electrical trade of the country is available. As, however, a number of alterations in the classification were made on October 1st, 1925, when the new Customs tariff came into operation, an exact comparison of the results for 1925 and 1926 is not always possible. In the following table are shown the number of dynamos, motors, convertors and transformers of certain specified weights exported during 1926, together with the total weight in double centner (= 220 lb.) and the value in gold marks.

	Number.	Weight. Do. c'tner.	Value. Gold mk. (thousands)
Up to 10 kg.	261,308	4,691	4,974
10 kg. to 25 kg.	23,765	3,934	2,223
25 kg. to 150 kg.	46,194	31,437	8,447
150 kg. to 500 kg.	10,159	27,524	7,038
500 kg. to 3,000 kg. ...	5,072	55,504	11,774
Over 3,000 kg.	791	86,605	13,575

Argentina, Holland, Austria, and Czecho-Slovakia figure prominently amongst the destinations of machines up to 150 kg. in weight; Russia, Italy, Argentina and Brazil are good customers for those from 500 to 3,000 kg., whilst of those over 3,000 kg. 86 went to Argentina, 72 to Italy, 61 to Russia, and 48 to Spain during the period mentioned.

In regard to the following items a useful comparison can be made of the results for the two full years :—

	1925.	1926.	Inc. or dec.

* Figures not available.

German Manufacturers' Combine.

With the object of reducing competition, a joint sales office has lately been established in Berlin under the title of the Verkaufs Gesellschaft Elektrotechnischer Spezialfabriken by a number of German manufacturers of electrical machinery and apparatus. Among the firms embraced in the new scheme are the Maffei-Schwartzkopff Co., of Munich and Berlin, the Pöge Elektricitäts Gesellschaft, Chemnitz; Voigt & Haeffner Gesellschaft, Frankfort-am-Main; the Dr. Paul Meyer Gesellschaft, Berlin; the Sachsenwerk l icht-und-Kraft Gesellschaft, Dresden; Dr. M. Levy, Fabrik Elektrischer Maschinen und Apparate, Berlin; and the Lloyd Dynamowerke Gesellschaft, Bremen.

Large German Rectifier Order.

What is stated to be the largest order for rectifiers and rectifier transformers so far placed has lately been secured by Brown, Boveri & Co., Baden, Switzerland—*viz.*, 95 rectifiers with transformers, air pumps and accessories having a total output of 114,000 kW, in connection with the electrification of the Metropolitan Railways of Berlin to convert the 30,000-V, 80-period a.c. supplied by the Berlin municipality to 800 V d.c. The contract also includes the supply of 160 high-speed 3,000-A circuit breakers for the d.c. side of the sub-stations. The rectifiers are notable not only from their mean continuous output of 1,200 kW per unit (1,500 A), but by the required overload capacity. The starting current of a motor coach is 3,000 A during 40 seconds, followed by 300 A during 50 seconds, this process being repeated every 90 seconds. The rectifiers will be located in 40 small sub-stations; these will be built into the arches of the viaducts and feed directly on to the rails. The German State Railway Co. has also divided the contract for thirty rectifying installations for the less important suburban lines between the Allgemeine Electricitats Gesellschaft, the Siemens-Schuckertwerke, and the Bergmann Co., of Berlin.

London's Electricity Supply in 1924-1925.

The L.C.C. Annual Report.

THE last of its annual reports on electricity supply in London (covering the year 1924-25) has been received from the London County Council (P. S. King & Son, Ltd. Price, with map, 5s.). In future the collection of statistics, &c., will be in the hands of the London and Home Counties Joint Electricity Authority. The period covered is the year ended March 21st, 1925, in the case of local authorities, and the year ended December 31st, 1924, for the companies. The area dealt with is 1,797 sq. miles with a population of 8,178,766 (1921 census) and a rateable value of £75,926,030 (April, 1925). The total number of authorised distributors was 89, comprising 44 local authorities and 45 companies. These figures include three local authorities not actually supplying electricity and exclude two purely bulk-supply companies. The first part of the report gives the areas, populations, and rateable values of the districts supplied by undertakers, together with particulars of the Orders authorising supply, &c.

Section (*b*) deals with plant capacity and output. It is shown that generating capacity rose from 758,477 kW to 843,517 kW, an increase of about 11.2 per cent. The local authorities' plant increased from 357,182 kW to 391,037 kW (9.5 per cent.), and that of the companies from 401,295 kW to 452,480 kW (12.7 per cent.). There was a fairly large rise in the capacity of plant installed for transforming bulk supplies, from 131,000 kW to 166,546 kW (27 per cent.); this increase was mainly attributable to the company undertakings. The number of consumers (premises connected) at the end of the respective periods was :—Local authorities, 228,404; companies, 251,984*; total, 480,338. The last figure represented an increase of about 9 per cent. The increases in connections were as follows :—Local authorities to 660,970 kW (8.8 per cent.); companies to 810,224 kW (14.0 per cent.); total 1,471,194 kW (11.6 per cent.). The total maximum demand rose from 550,268 kW to 606,420 kW, and the load factor improved from 21.6 to 22.3 per cent. (local authorities from 23.1 to 23.3 per cent.; companies from 20.3 to 21.4 per cent.).

The next section deals with output and sales. The total amount of energy sold by the municipal undertakings, deducting intersales, was 479,620,308 kWh, as against 426,801,721 kWh, an increase of 12.4 per cent. The companies sales rose by 15 per cent. to 521,679,086 kWh, and the grand total by 13.3 per cent. to 964,924,072 kWh. Of this total traction supply accounted for 50,671,801 kWh, as compared with 46,480,498 kWh in 1923-24.

Financial results are next dealt with. The total capital investment of the municipal undertakings at March 31st, 1925, was £19,232,872, indicating an expenditure of £1,296,146 during the year. (These figure exclude expenditure out of revenue.) The total loans raised amounted to £18,988,370, and 40.31 per cent. of this amount had been repaid or was provided for by sinking fund. The average rate of interest was 4.60 per cent. The revenue from all sources for the year under review was £4,438,174 (as against £4,202,706), while the working expenses were £2,352,188 (£2,221,441), and after meeting rates, taxes, &c., the balance available to meet capital charges was £1,887,915 (£1,782,209). Out of this were paid :—Interest, £526,342; loan repayment, £737,348; reserve funds or capital expenditure, £471,782; making a total of £1,735,469 (against £1,573,620). The net profit was thus £152,446, as compared with £208,589. Nothing was taken from the rates, but 17 undertakings contributed a total of £145,930 to rate relief.

The tables relating to the company undertakings show a total capital expenditure of £28,968,474 at December 31st, 1924, as against £26,253,452 at the end of 1923, an increase of £2,715,022. The total capital called up rose by £1,014,466 to £23,781,563.* Ordinary capital represented 34.5 per cent.† of this; preference capital 27.0 per cent.†; and debenture capital 38.5 per cent.† The average rates of dividend on the ordinary and preference shares were 13.42† and 5.87 per cent.† respectively. The over-all average rate of dividend and interest was 8.11 per cent†, as compared with 8.00† per cent. in 1923. The total revenue for the year was £6,624,761 (against £6,127,194), and the total working expenditure £2,688,010 (against £2,433,369). The amount available for capital charges was £3,901,960 (£3,728,939). Interest and dividends absorbed £1,972,214† (£1,829,602†), and £1,897,270† (£1,638,261†) was transferred to reserve funds or expended on capital works, making a total of £3,869,484† (£3,467,863†). At the end of the year reserve, renewal, &c., funds showed a total of £8,694,886† (£6,986,998†).

Table 7 gives the average rate of interest and dividends paid by the London companies in each of the 24 years from 1902 to 1925. In the last year the total average dividend was 7.97 per cent. (compared with 8.22 per cent. in 1924 and 8.07 per cent. in 1924). The highest rate (16.12 per cent.) was paid by the Notting Hill Co. and the lowest (4.72 per cent.) by the Kensington and Notting Hill joint station. Up to the end of 1925 premiums raised by the London companies on the issue of capital totalled £1,013,022, the bulk of which was transferred to reserve funds. Another table shows the annual capital expenditure of each of the London municipal and company undertakings for the years 1919-1925. The main feature of this is that whereas in 1923-24 the respective expenditure of municipal and company concerns was £1,087,483 and £2,169,714, in 1924-25 it was £1,103,580 and £5,931,695. The large increase in the company figure is traceable to the County of London Co., whose expenditure during 1925 was £3,871,604. St. Marylebone led the local authorities with £165,600.

The next table shows the provision for depreciation or its equivalent made by each of the London undertakings at the end of the year 1924-25 or 1924. In the case of the companies this shows the state of the reserve funds at the end of the year. In one case (the County of London Co.), the amount stood at over £2,000,000, while the City of London Co.'s figure was £1,768,694, and that of the Metropolitan Co. £1,206,864. In the case of the borough councils the total loan repayment is shown. St. Marylebone, with a total capital investment of £2,713,804, is recorded to have repaid (or provided for the repayment of) £834,486. It is pointed out that the real value of this table can only be gauged when a number of factors are taken into account.

As usual, a large section of the report (12 pages) deals with charges for supply. The lack of uniformity in this respect makes fair comparison impossible. No fewer than 22 different methods of charging are in force and comparison can only be made within each class. With the spread of the two-part method, it is not always fair to assume that flat rate charges give a true indication of the level of prices fixed by an undertaking, but it is the only system which is employed by all undertakings. Then, again, the flat rate shown for an undertaking is sometimes merely the first step of a sliding scale; in the case of lighting, at least, a few domestic consumers, we believe, qualify for the further steps. With these points in mind we can examine the flat rate tables. The lighting rates, it is seen, vary between 4d. per kWh in respect of six undertakings (five municipal) to 11d. in the case of two companies. Ninety-three charges shown give an average rate of 6.75d. per kWh. In the preceding year the average of 85 charges was 6.9d. per kWh (min. 4d., max. 1s.). The table giving flat rates for power contains a record of 74 charges (some, again, the first steps of sliding scales). The lowest is 1d. per kWh in three undertakings (two municipal), and the highest is 7d. in the case of two companies, in each instance the first step of a sliding scale. The average rate is 2.81d. per kWh. The last report gave an average of 2.95d. per kWh for 72 undertakings (min. 1d., max. 7d.). Heating and cooking flat rates number 90. In this case a charge as low as ¾d. per kWh is given (Wimbledon, summer quarters), and there were 15 undertakings with a charge of 1d. per kWh (three companies). The highest rate was 6d. (company), and the average of the 90 was 2.07d. per kWh, comparing with 2.2d. per kWh the average of 85 undertakings in the last report (min. 1d., max. 6d.).

Assuming that these flat rate figures afford an indication of price-level changes, the decreases in charges were as follows :—Lighting 2.17 per cent.; power 4.75 per cent.; and heating and cooking 5.91 per cent.

In another section the annual sales of energy by each undertaking are detailed for five years. With the 1924-25 figure is given the percentage increase above the preceding year. The greatest improvement among the municipalities was shown by Bermondsey (31 per cent.); Wimbledon was very close (28 per cent.). In the Metropolitan area, Stepney's sales only rose by 6 per cent., but in the outer area there were three below this. The best showing among the inner London companies was that of the County of London Co. (20 per cent.), but, in outer London, there were several better than this—the Egham and Staines Co. showed an increase of 59 per cent. On the other hand, two of the outer London companies reported decreases (12 and 6 per cent.). The overall increase for all undertakings was 14 per cent.

This concludes the report proper, but there is a valuable appendix bringing the statistics for the companies up to the end of 1925. The information given may be briefly summarised as follows :—Plant capacity at end of year 528,940 kW (generating) and 140,160 kW (transforming); maximum demand 419,739 kW; number of consumers, 214,873*; total connections, 827,341 kW; overall load factor, 21.1 per cent. (max. 25.7, min. 7.7); energy sold, 610,615,295 kWh (traction, 23,540,418 kWh); capital expenditure at end of year £35,417,261; capital called up, £26,428,017; average rate of dividend and interest, 7.95†; total revenue, £7,030,837; working expenditure, £2,735,041; available for capital charges, £4,306,410*; capital charges, £4,287,521*; total of renewal, reserve, &c., funds, £10,338,601*.

* Incomplete totals.

† Calculated on incomplete totals.

The Telephone Service.

Development Statistics relating to the North-East Coast, North Wales, and Birmingham Districts.

ANNUAL reports to the Telegraph and Telephone Advisory Committees (copies of which have been sent us by Mr. J. R. M. Elliott, superintending engineer, Northern District, P.O. Engineering Department) show that during 1926 development in the Northern District was as follows:—

Northern Development.

Newcastle-upon-Tyne.—The gross increase in telephone stations was 4,082; there were, however, 2,229 cessations, making a net increase of 1,853 stations, equal to 5.8 per cent. Of the new services added, an average of 55 per cent. was completed within one week of receipt of the order, and 70 per cent. in two weeks. An analysis of statistics is as follows:—

Exchanges	117
Telephone stations (total)	31,666
Residence rate stations	4,158
Call-office stations	474
Street kiosks	48
New exchanges, rural	23
Rural party-line stations	90
Rural railway stations	1

In the Newcastle area considerable progress has been made with the preliminary work in connection with the introduction of automatic switching, and several new buildings for housing the equipment have already been completed. Similar progress has been made in the Sunderland area. New exchanges were opened at six places during the year, and arrangements made to open others. Switchboard extensions have been made in 21 cases, and conversion of the Newcastle City exchange to modern common-battery working improved operating facilities. The construction of a new exchange at Durham will be put in hand immediately the new premises are ready; the switchboard will be of the latest common-battery type. The introduction of automatic working in the Gateshead area will involve the opening of an independent exchange at Low Fell, and a temporary manual exchange is about to commence operation. In addition, consideration is being given to the provision of new building accommodation for exchanges at 12 places. The number of originating local and fee junction calls for 1926 in the Newcastle-on-Tyne district exceeded 28,800,000 and the trunk calls 2,316,000, in each case an increase on the figures for the preceding year. The number of written complaints from subscribers in connection with the local and junction working was 2.3 per 100,000 calls, and for trunk working 5.6; 69 additional trunk and junction circuits were brought into use. The average speed of answer by telephonists was 5.6 seconds, the percentage of calls answered in 5 seconds was 65 per cent., in 10 seconds 91.2 per cent., and in 20 seconds 99.2 percent., while the average time taken to obtain a reply from subscribers on local and junction calls was 31.4 seconds. The permanent Newcastle repeater station at Kenton will shortly take the place of the temporary station now functioning, and at Catterick another on the same line of communication will be brought into service concurrently. Private branch automatic exchanges in subscribers' offices are growing in popularity, and in the Newcastle district the total number was five. The main-line underground trunks and telegraph lins increased by 2,523 miles to 43,342; and underground local line (subscribers) by 10,850 to 66,666 miles.

Middlesbrough.—The number of telephone stations in use was 11,264, an increase of 750; of the new services added, an average of 50 per cent. was completed within one week of receipt of the order and 70 per cent. in two weeks. A total of 27 new call offices were opened, six in town sub-offices, 9 in rural sub-offices, and 2 at railway stations. The number of street kiosks was also increased by 17 to a total of 37, and three further kiosks were in course of erection; the total number of call offices (including kiosks) was 261. An additional feature recently established in this district by the police authorities was the provision of telephone police boxes at various points in the larger towns; in certain areas they may be used by the public to call the police, fire brigade, or ambulance headquarters, and the total number of such boxes was 7. Improvements in switching equipment were effected in various parts of the area, and in sparsely-populated districts two new rural exchanges were opened, while the establishment of three additional rural exchanges was in hand.

The conversion from manual to automatic switching at West Hartlepool and Hartlepool took place in September, 1926, and the policy of extending underground conductors continued; additional trunk lines were completed and considerable progress was made in the Middlesbrough telephone district in the extensive preliminary work which is necessary in connection with the general introduction of automatic switching. At Hartlepool and West Hartlepool the total of 1,105 subscribers are highly satisfied with the change, and agree that a much superior service is rendered by the new system.

The existing automatic exchange at Marton, which provided for 100 subscribers, is at the present moment in course of extension to provide accommodation for a further 200 subscribers' lines. At Middlesbrough, Stockton, and Linthorpe new buildings for the accommodation of the new automatic exchanges are expected to be completed in the early part of this year. The number of effective trunk calls brought to account for the quarter ending December 31st, 1926, was 287,442, an increase of 3.2 per cent. The number of telegrams received by telephone decreased to approximately 33,000, as against 40,400 for the corresponding period in 1925. The approximate daily average number of originating local calls was 11,990, being an increase of 10.3 per cent.

Midland Statistics.

The abstract of the report which follows (a copy of which has been sent us by Mr. T. Plummer, superintending engineer, North Wales District, deals with the development of the service in the Birmingham area during 1926.

Birmingham.—The area covers 700 square miles and extends from Brownhills on the north to Bidford on the south, and from Kinver on the west to Coleshill on the east. Telephone stations totalled 57,919, representing an increase equal to 9.89 per cent. for the year, which is lower than that for the previous three years, and is doubtless due to the general depression in trade. The appreciation of internal systems in large stores or offices is indicated by the fact that during the past year approximately 1,800 telephones were provided for subscribers already hiring an installation consisting of two or more telephones. Subscribers' private automatic exchanges provided during the year totalled 16 installations, and there are now 813 such stations working in the district; 1,630 stations were installed during the year at private residences, making a total of 9,810. The demand for call office facilities is growing rapidly, and 142 additional call office stations were installed, making the total 642; of that figure 260 are street kiosks.

The number of local calls made in 1926 was 50,600,850, an increase of 17.7 per cent. The number of trunk calls increased by 9.6 per cent. to 3,362,978, and the number of telephone telegrams dealt with was 744,828, which shows a decrease of 5.1 per cent., due partly to the reduction in betting telegrams since the introduction of the tax on betting transactions.

Partly owing to the extensive operations of laying ducts and the drawing-in of cables carried out in 1924-25 there was not so much need for expansion in this direction during 1926; 3,108 miles of wire was brought into use for trunks and telegraphs, 29,828 miles for subscribers' telephones, and 13,728 miles were added in reserve for future extensions under all classes of service, making a grand total of 225,370 miles. Overhead wires erected during the year amounted to 1,548 miles, bringing the total up to 23,817 miles, an increase of 7 per cent: the comparative increase for underground wires was 11.5 per cent. for main lines and 24.3 per cent. for subscribers' lines.

One exchange was opened during the year at Earlswood with switchboard capacity for 60 subscribers, making altogether a total of 76 exchanges in the district. A new exchange will shortly be opened at Northfield, and extensions of equipment at 30 existing exchanges were carried out. The repeater installation was extended by the addition of 80, bringing the total equipment up to 110, and complete precision testing apparatus has been fitted. The average time of answering subscribers' calling signals for the year was 5.6 seconds, 88.2 of the calls being answered within 10 seconds or less, a considerable improvement on that for the preceding year.

The operating staff numbers nearly 800 telephonists and supervisors, in addition to over 100 male night operating telephonists. Over 113 new entrants to the service passed through the Birmingham Operating School (including six for other districts), and 14 telephonists employed by subscribers for their private branch exchanges were trained. The total engineering staff employed in the construction and maintenance of telephone and telegraphs in the district during the year reached 955, in addition to an average of 245 workmen employed by contractors in laying conduits and other work.

North Wales District.

In the Chester, North Wales, and Hanley area during 1926 some 2,939 telephones were added during the year bringing the total to 31,786. The number of effective trunk calls was 3,226,982, or 12.5 per cent. increase; telegrams passed over the telephone totalled 350,000; local effective calls amounted to 13,583,429, or 3.2 per cent. increase; 103 additional trunk and junction circuits were connected. Public call offices and kiosks increased by 53 to 774, and additions to the underground plant cost £68,600. During the year 2,335 miles of wire was brought into use for trunks and telegraphs, 11,107 miles for subscribers' telephones; 495 miles were used from the reserve for future extensions under all classes of service, leaving a balance of 18,590 miles of wire available for this purpose. The gran total of wires for all classes of service existing amounts t 89,142 miles. Overhead wires erected during the ye amounted to 2,846 miles, bringing the total for the combine district up to 60,939 miles, an increase for the year of 4. per cent. Attention may be directed to the comparativ increase of 13 per cent. for the main lines and 28.3 per cen for subscribers' lines underground.

Fifteen new exchanges, making a total of 294 in the di trict, were opened during the year. Extension of switchin equipments were carried out at 77 exchanges, the tot additional accommodation being for 3,250 lines. The ne automatic exchange at Shrewsbury, opened in January, 192 is giving very satisfactory service.

A New Type of Tramway Controller.

The Cam-operated Contactor Pattern introduced by the Metropolitan-Vickers Co.

THE ordinary drum type controller, which until recently was the only type used in tramway work, has, within its limitations, given excellent service. The adoption of more powerful motors and higher car speeds has, however, increased the maintenance cost of control gear and shown the drum type to be already inadequate to meet present-day requirements.

In approaching the problem it is necessary to keep in view certain fundamental requirements: the mode of operation

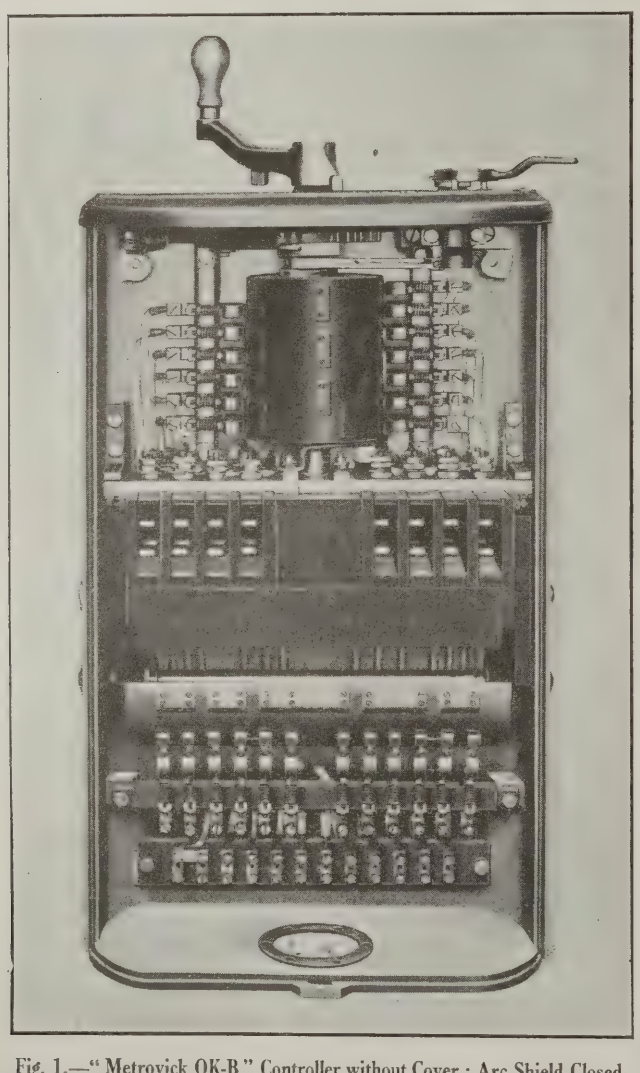

Fig. 1.—"Metrovick OK-B" Controller without Cover; Arc Shield Closed.

must follow closely the present method with which drivers are familiar and, consequently, the position and movement of the control handles must be similar to those of the well-known drum controller. Limitations of size and weight are also important, and the all-important maintenance cost must be satisfactory. An important contribution to the solution of this problem is provided by the recent development by the Metropolitan-Vickers Electrical Co., Ltd., of a tramway con troller in which the hitherto universal drum and finger con tacts have been replaced by cam-operated contactors. Con trollers of the new type have been thoroughly tried out unde severe service conditions, and have both reduced and simplifie maintenance work, and have shown that they are capable o service for which controllers of the drum type would b quite inadequate. Whilst contactors are a new feature i tramway controllers, it is worthy of note that their intro duction has not been accompanied by an increase of cost but by a reduction in size and weight for a given capacity.

In external appearance the new controller is very simila to the ordinary type; its interior is shown in fig. 1. Al current-rupturing is done by eight contactors mounted on horizontal shaft and operated by cast-iron cams clamped upo an insulated steel shaft of square section, the latter bein driven with the aid of cut-steel bevel gears by the mai controller handle; the arrangement of these parts is shown in fig. 2. Power and brake connections are made, withou arcing, by a quadrant arranged horizontally below the con tactors and rotated by mechanism fixed to the camshaft i

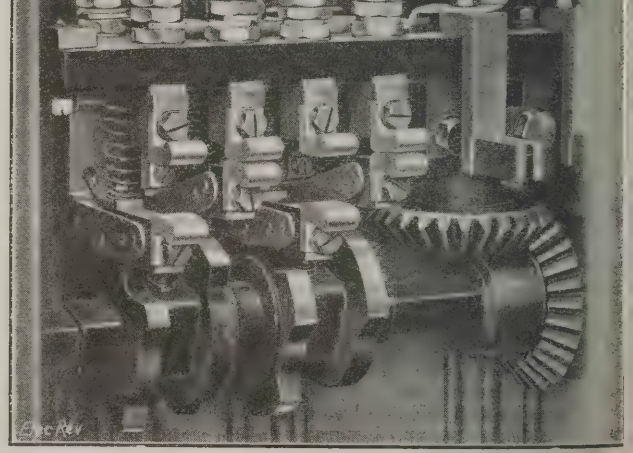

Fig. 2.—Contactors and Cam Mechanism of Controller.

such a way that it is positively held in the power, brake or off positions. The forward and reverse drum is mounte loosely on the control spindle above the contactors; it i constructed of Bakelite, secured to a cast-iron spider, and is operated by a separate handle that is interlocked with the main controller handle to meet all requirements for norma running in either direction. Cutting out a defective moto is provided for by extra positions on the reverse handle Any of the usual combinations of rheostatic and magnetic braking can be arranged for and a notch-by-notch device can be fitted to the main handle if required.

When the arc shield is closed, as shown in fig. 1, the fire proof insulation forms a separate cell-like enclosure for each contactor. Closing the arc shield also carries into position the blow-out coils and core plates; the contacts for the blow-out coils close the main power circuit, so that the controller cannot be used without the arc shield in position. Important advantages are offered by the new design: not only are con tactors in themselves claimed to be more effective than finger contacts for arc rupturing, but the wear on contacts is stil

urther reduced by the more effective arrangement of blow-out evices which is possible with contactors; further, only one

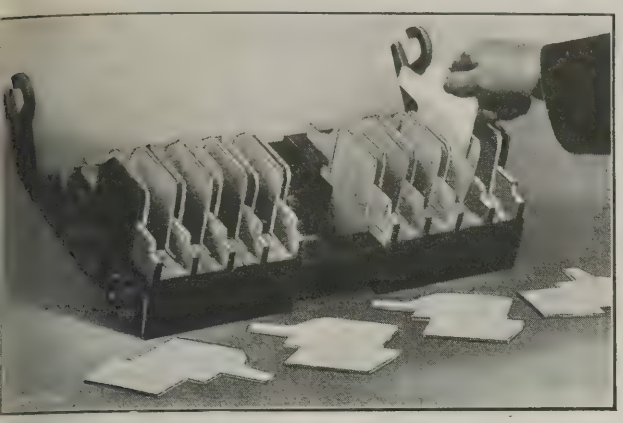

Fig. 3.—Arc Shield, showing Simple Method of Renewing Partitions.

ind of arcing tip is used, the tips do not get burnt at the oint of fixing, and replacements are made more easily and quickly. Fig. 3 shows how the partitions of the arc shield can likewise be renewed with a minimum of trouble. Each partition is held in a slot, from which it may be withdrawn and a new one inserted in a moment, no further fixing being necessary; thus renewable parts are small, simple, few in number, and easily replaced. Accessibility of all parts has been facilitated: the arc shield when swung back can be lifted off bodily, and the contactor and camshafts can be removed by simply slackening their bearings; the terminal board being at the base of the controller, all incoming wires terminate at that level, a much more convenient arrangement than the usual side connections.

The anticipated improvement in operation and reduction of maintenance costs are claimed to have been fully realised in operation in the last three years, during which period some difficulties such as are inevitably met with when introducing a new design have been overcome. Since 1922, when the first contactor controllers were put into service, four hundred have been supplied and are now in successful operation under the severe service conditions of the London L.C.C. tramways, and many others have been installed on other systems. An important order was recently received by the Metropolitan-Vickers Electrical Co. from the Leeds Corporation for tramcar equipment, including three hundred controllers of this type, and a considerable number have been already installed and are operating satisfactorily. Indications are that the advantages of the contactor-type of controller will appeal to tramway engineers.

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

A Small Electric Oven.

Arising out of the article published in our issue of December 31st last, "The Trials of a Housewife due to Trials f Electricity," by May M. Cramp, we have received from he Windsor Electric Range Co., Windsor House, Victoria treet, London, S.W.1, some particulars of its product, the Windsor" electric oven, fig. 1. This is a particularly uitable apparatus for use in the small flat, or where space s limited. It has a low loading, 660 W, and, it is claimed, vill provide for a two-course dinner for four to six persons or a consumption of only ¾ kWh. It is constructed on mass roduction lines, and is suitable for supply pressures from 00 to 250 V. The heating elements are claimed to be par-icularly robust and designed for exceptional durability. Top nd bottom heating are provided, four-fold circuits being

Fig. 1.—Small Electric Oven.

rranged in each case, so that should a coil fail, even during he process of cooking, there is ample heat to continue the perations satisfactorily. The cooking space is 13 in. by) in. by 12 in. Three-heat control is provided. The pparatus was shown at the Exhibition of Inventions, Central lall, Westminster, in October last, and was briefly referred to in our issue of November 5th, 1926.

An Improved Ironclad Switch.

An addition to the range of switchgear of the General Elec-ric Co., Ltd., Magnet House, Kingsway, W.C.2, is the D.B. inor d.p. switch with fuses, fig. 2. It is mounted in a ast-iron case with external fixing lugs, and suitable for 10-A ading at 500 V, or 15-A at 250 V. This device has been specially designed to meet the increasing demand for inexpensive but efficient switchgear suitable for lighting and heating circuits in house-service and similar installations, and also for small power circuits in factories and workshops. The apparatus can be rendered weatherproof by inserting a gasket in a groove in the lid. It is provided with positive quick-make-and-break actions, controlled by a powerful non-corrosive spring which is in compression only during the operation of the switch. The switch blades are of hard-

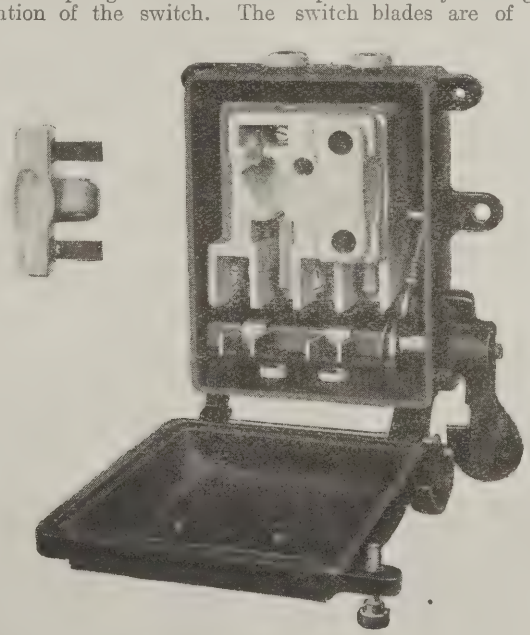

Fig. 2.—Ironclad Switch-Fuse.

drawn copper firmly secured to a square-section steel coupling bar, which is insulated throughout its length by bakelite. The fixed contact blocks are of brass with two clamping screws, and have phosphor-bronze side pressure wings, all the parts being of ample current density. The fuse carriers are fitted with heavy-section brass blades which engage with brass contact blocks having phosphor-bronze side pressure wings. The fuse wire passes through an asbestos tube fixed in the body of the holder, and when in position is situated low down in the deep arcing chamber in the base. There are two cable inlets at the bottom of the case, and two at the top, all being wood bushed. The unit is of liberal design and substantial construction throughout, and complies in every respect with the H.O. Regulations.

Another Internally Frosted Lamp.

Messrs. Siemens & English Electric Lamp Co., Ltd., 38-39, Upper Thames Street, London, E.C.4, inform us that they have recently introduced a new size of "Purlite," internally frosted lamp, of 15-W capacity, to meet the demand for a low-power unit suitable for the usual lighting supply pressures. This is available and suitable for any pressures up to 260 V. "Purlite" gasfilled lamps are now supplied in 40-, 60-, 75- and 100-W sizes, and "Purlite" vacuum lamps for 15 and 25 W.

Machinery Fault-Detecting Apparatus.

What should prove very useful to all engineers in charge of running machinery is the Bin-Aural apparatus which has been developed by the Capac Co., Ltd., 11, Willow Avenue, Barnes, S.W.13, for the audible detection of mechanical faults and comparing the running conditions of various parts. The apparatus consists essentially of a stethoscope, which is used in conjunction with specially designed sound reproducers for internal or external sounds. For internal work the "Tectoscope" is employed; a metal rod is screwed into this, and by applying the free end to the external part of the bearing or other part to be tested, the sound emitted is reproduced in the stethoscope and conveyed by means of specially designed connecting tubes to the ears. By means of a boss, angles may be introduced in the conductor rod, and a special joint serves for various sizes of rod up to ¼ in. section for distance work. It is claimed that with ¼-in. mild-steel rod long runs up to 100 ft. may be satisfactorily employed. For external work the sound is reproduced by means of the "Tectophone"; this carries a small mouthpiece, which is held near the part to be tested. This is particularly suitable for testing gearing for tooth noise; leakages of gases may also be detected in this way. An important feature of the apparatus is the provision for comparison testing, one bearing, or other part, with another. A junction in the tube in this case serves for two "Tectophones" or "Tectoscopes," or one of each. By first applying one only, and then the other in addition, the sound difference can be defined and the running conditions compared.

A Unit-Type Feeder Pillar.

A unit-type feeder pillar is being made by Messrs. Johnson and Phillips, Ltd., Charlton, London, S.E.7, and figs. 3 and 4 show one of a batch of seventeen which have recently been supplied to Pudsey Corporation.

The casting is of ample strength, and the pillar is well ventilated and embodies a patent locking device, consisting of two locks operating together, for preventing unauthorised persons from opening the door. Each way of the actual distribution unit is complete in itself, the cable box, link, and fuses being mounted vertically on a pair of steel rods, and the complete equipment can be removed to facilitate jointing. The cable boxes are designed to reduce the time required to connect up the cable to a minimum, and the porcelains are fitted with stems to avoid the necessity for bringing out the cable tails. No copper castings are used either in the box fittings or in the fuses, a maximum conductivity thereby being assured. The fuses and links are insulated from the steel supporting rods by means of substantial porcelains, no slate or hygroscopic insulating material being used. The porcelain fuse holders have self-aligning contacts, and are fitted with Zena fuse elements which can be rated to "blow" at a current much nearer the normal full-load current than can ordinar

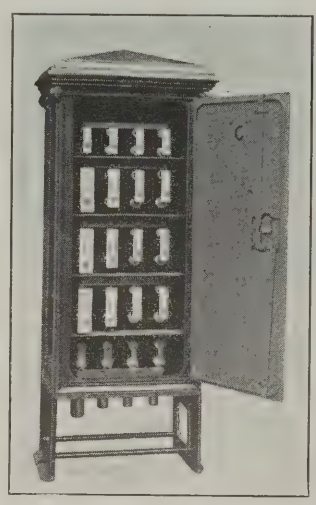

Fig. 3.—Feeder Pillar, Front.

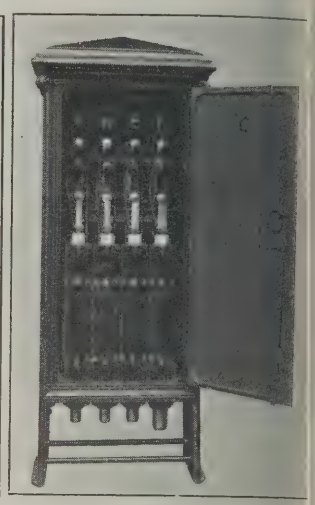

Fig. 4.—Back View.

copper fuse wire. B.E.S.A. clearances are obtained between phases and to earth, and fireproof barriers are fitted between fuses of different polarity. The pillar illustrated is for use on a three-phase, four-wire system, with cables having a fifth core for street lighting service.

A Commutator Lubricant.

We have received a sample of Komm-Glaze, a new commutator lubricant which is to be put on the market by the Ray Manufacturing Co., Fishponds, Bristol. It is prepared in the form of sticks of about ½ in. diameter, and is of a substance closely resembling ordinary candle wax, but smoky in appearance. It is claimed that the use of this lubricant lessens the contact drop, increases the conductivity and the life of the brushes and commutator, and produces a pleasing "copper brown" surface on the commutator. It is guaranteed that the substance will not react or carbonise under any circumstances.

A Small Hydro-Electric Plant.

Electricity Supply to a North Nigerian Tin-Mining Undertaking.

THE Northern Nigeria (Bauchi) Tin Mines, Ltd., is fortunate in having acquired the use of a waterfall some 12½ miles distant from its property for supplying power for the mines, and a hydro-electric station has been established which is now supplying 2,000 kW during the

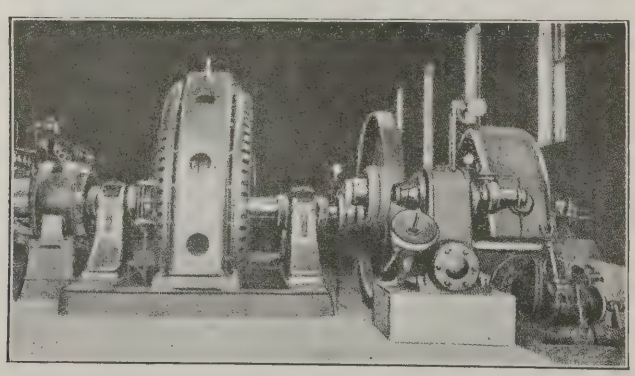

Fig. 1.—500-kW Hydro-Electric Generator.

greater part of the year. The power thus obtained has resulted in a great reduction in the cost of mining, and has enabled the company, without increasing its staff, to double the output of tinstone with highly satisfactory results.

In the power house at Kwall, 700 ft. below the edge of the plateau, there are four generating sets, of which one of 500 kW was supplied by the Swedish General Electric Co., Ltd., and is driven by an Armstrong-Whitworth turbine, fig. 1. Power is generated at 550 V and stepped up to 22,000 V for transmission, over very rough intervening country, to an outdoor sub-station situated at the strategic centre of the property. This is designed for an ultimate capacity of 2,000 kVA, but is equipped at present with two 450-kVA Asea transformers. The supply is here reduced to working pressures of 2,200 V for the large pump motors, and 400-230 V for the small motors and lighting. The lighting supply has proved an important feature of the plant, and has resulted during night operations in a great saving of tin which would otherwise be lost in the tailings.

A further sub-station has since been erected 2½ miles from the main one on an important tin-bearing ground which was previously worked by oil-engine-driven pumps. This houses a 450-kVA Asea transformer.

The climatic conditions on the Nigerian plateau are especially severe for electrical apparatus. In the winter, the air is intensely dry and cold, while in the summer it is the extreme opposite, being humid and warm to an uncomfortable degree. In the dry season, and as a result of mining operations at all times, a great deal of fine sand is blown into the machinery. In spite of these abnormal conditions, however, both plants have given great satisfaction.

Electric Furnaces in Non-Ferrous Metallurgy.

By DONALD F. CAMPBELL, M.A., A.R.S.M.

(*Abstract of a paper read before the* Institute of Metals.)

INGLE furnaces of 4,000 to 10,000 kW are now engaged in smelting pig iron and in the manufacture of carbide, while probably about half a million kW of furnace pacity is engaged in melting metals, to which must be led a million or more kW of generating machinery used for king aluminium and smelting ferro-alloys.

There are a few general principles which seem necessary in design of efficient electro-metallurgical plant. It is essen- that equipment should first satisfy the requirements of metallurgist, and that the electrical engineer should meet demands. The electrical engineer should then be given a hand and allowed to purchase only the very best equip- nt. Numerous failures of electric furnaces are due to metal- gists interfering in electrical equipment, or electrical engi- rs designing unpractical metallurgical appliances, while rchasing departments have not infrequently caused trouble buying inferior equipment for the arduous service insepar- e from metallurgical work. For almost every group of ys an electric furnace of special design is required, and any particular metal, the type of furnace to be selected y depend on the hours of work.

The Ajax-Wyatt furnace is now the standard melting ipment for supplying brass mills. It consists of a cylin- al steel vessel lined with brickwork or rammed refractory terial, below which a transformer is suspended, the secon- y of which is a vertical V-shaped channel arranged so t it passes round the primary winding and iron of the trans- ner. Heat is generated in this secondary circuit and the al is well circulated by electrical forces, so that hot metal onstantly forced out of the secondary, and cooler metal es its place. This mixing effect is due to three forces— ely, convection currents, electric motor effect, and inch " effect.

he electrical design of these furnaces requires care, but allurgically they work with extraordinarily little trouble ne bottoms are properly made and dried. The cost of re- tories may be as low as 1s. per ton melted.

he life of the linings varies from two or three months to or three years, and as the cost of labour and materials ramming the bottom only costs from £30 to £40, it is clear this is not a very serious item on an output of 600 to 0 tons per lining.

nese furnaces are usually run continuously at 60 kW, pro- ng 600 lb. of brass every 60 to 70 minutes, and during ods of idleness the furnace is kept warm with a current sumption of about 8 kWh an hour.

ne power consumption when melting 60 : 40 brass in such a ace should not exceed 220 units per ton, to which must dded the stand-by current consumed during idle hours.

though the efficiency resulting from the generation of the within the metal itself is remarkable, its limitations are ous, as suitable refractory materials have not yet been d to produce linings for metals of high melting point.

considerable economy in the cost of making brass in this ace is due to the accuracy of composition attainable, so the usual margin of copper in excess of the specification be reduced.

the Ajax-Northrup furnace, the newest form of melting pment, the metal is heated by induction in a high-fre- ncy field, wherein there is no need of iron, nor of a ndary of the type used in normal frequency induction fur- s. The furnace itself is of simple construction, consisting of a crucible, round which a spiral inductor coil is wound, the narrow intermediate space filled with zirconite or other heat insulator. Tests showed that 6-cwt. charges ckel-silver containing about 15 per cent. of nickel could be ed in an average time of 1 hour, the average consumption g just under 350 kWh per ton; 4-cwt. charges of cupro- el were melted in an average time of 55 minutes, the age consumption being 448 kWh per ton.

e average life of crucibles in a large number of heats of o-nickel and nickel-silver was 58, which was increased to y patching, but it was found to be doubtful whether the caused by patching was justified by reduced costs. It ires about 4 hours for the crucibles to cool before patch- can be begun, and 6 hours for subsequent drying. The on crucibles is normally about 0.75 in. deep after 60 heats ckel-silver. The conditions of melting in Ajax-Wyatt and hrup furnaces of normal design are not those suitable for ing aluminium and its alloys, which should be melted in uillity.

Experiments are now being made to evolve equipment giving the requisite conditions, but the final form of the most suitable furnace is not yet determined, as all experiments of this type must be made over a long period and on a substantial scale before electric melting can be confidently recommended, and costs of operation and quality of product established.

In some tests in the United States silver was melted at the rate of 10.9 lb. per kWh.

An interesting installation of small units has been erected in Staffordshire to manufacture nickel-iron alloys of exceptional purity to be used for " loading " submarine cables. High-frequency current was produced by mercury spark gaps operated in hydrogen with batteries of condensers for power-factor improvement. Forty-two such units were used and have been operated for many months, both day and night shifts, with satisfactory results.

As compared with " pit fires," this furnace has the advantage of avoiding all contamination from sulphurous fumes and other impurities. Labour costs are reduced, and skilled casters of exceptional strength are unnecessary, while absolute control of heat and complete mixing are obtained. The space occupied by coke and ashes is no longer required, while chimney and furnace repairs are eliminated. Crucible costs are reduced to a fraction of those of pit fires. On the other hand, capital expenditure is considerable, and a skilled electrician is required for rotary machinery. For works operating by day only this furnace has great advantages, though the interest charges are naturally increased by the shorter hours of work.

Discussion.

Dr. H. W. Brownsdon said that from time-temperature curves he had taken while running an Ajax-Wyatt furnace he had found that it required from 50 to 55 minutes to melt the metal, and then a certain amount of superheating was required; the superheating might be 100 deg. or so above the melting point of the metal. He considered the figure of 224 kWh per ton for melting 60 : 40 brass for extrusion billets in a 600-lb. Ajax-Wyatt furnace was reasonable. In the best running conditions he had experienced the metal loss had not been less than 1.1 per cent., and was made up of practically 80 per cent. of zinc represented as oxide. Under average working conditions the loss came out at 1.3 per cent., of which about 1.1 was zinc oxide. It occurred to him that the Ajax-Wyatt furnace needed an arc at the top so that with more heat there the added scrap could be melted more quickly. He considered that there was just as bright a future for the application of electric furnaces to heat treatment and annealing as to melting. In annealing the whole of the energy, except that lost by radiation, could be absorbed into the material, given suitable design, and in an experimental furnace which he had running he had reached the point at which 60 kWh per ton was quite a reasonable current consumption for the annealing of brass; he had no doubt that that could be much improved.

Mr. W. R. Barclay was disappointed that the arc furnace had not received more attention. In arc-furnace melting there were not the same serious troubles as in other electric furnace melting practice with regard to refractories, and there was greater elasticity in choice of refractory materials. Arc furnaces also permitted a certain amount of refining. With proper working the danger of absorption of carbon from the electrodes could be reduced to a minimum. He was not quite sure that purer melting could be obtained with the high-frequency furnace than with any other type. It was remarkable what a high degree of purity could be obtained with the arc furnace, properly controlled. He emphasised the necessity for the close collaboration of the metallurgist and the engineer in design, in order to produce ideal melting plant. The electric furnace gave accuracy of control which was not obtainable with any other type, and the bogie of cost was really not so serious as it appeared to be on paper. One of the great advantages of electrical heat treatment was that one was able to bring the furnace to the work without inconvenience to the operator; when other types of annealing furnaces were used, the cost of transporting material to those furnaces was astounding. In a modern, well-designed, electric furnace one could have a very high standard of insulation, so that a man could work a wire-drawing machine within 2 ft. of a furnace which was annealing the wire at a temperature of 800 or 900 deg., and yet not feel the heat.

Mr. A. Glynne Lobley said that in the Watson furnace, which was English, the electrical portion was out of the way of

the operator, and there was very little fear of breaking the electrodes. He had been faced with the problem of melting aluminium electrically in bulk, and had had to rule out both the arc and the induction furnace. There were several difficulties in the use of the induction furnace for the purpose, including the high conductivity of aluminium, "pinch" effect, and the difficulty with regard to the refractory. He built a furnace using carborundum troughs, with granular carbon as the resistor, and it gave excellent results. Mr. Lobley also referred to a small crucible type of furnace heated by external nickel-chromium resistors. The crucible held 60 lb., the furnace being used for melting aluminium alloys in very small quantities for die casting. The cost of running was rather less than that of the gas furnace which it had supplanted, even though the electric furnace was kept hot all night and used only in the daytime. He had used the star-delta connection for industrial annealing furnaces on 440 V. The dimensions of the smallest furnace were 2½ ft. across and 6 ft. long. In one type of resistor furnace nickel-chromium strip was held in metal supports in such a way that there was no shielding at all, so that hot spots were avoided. The speaker referred to a patented method in which currents of extremely high frequency were applied to bring about surface heat treatment. One could calculate the frequency which was necessary to locate the heating at the surface, and it would be possible to bring about surface heat-treatment where required without having to raise the whole of the material to the required temperature.

Mr. H. H. Hayes quoted figures for a typical week's run of the first Ajax-Wyatt furnaces put down in the Midlands: 98 tons of metal were charged, of which 98.5 per cent. was poured as ingots. The hours of running and melting respectively were 168 and 126. The average consumption per ton of metal charged was 240 kWh, and the total metal irrevocably lost was 2.5 per cent. The supply was at 50 cycles. In a furnace of the same type, but supplied at 25 cycles, the average consumption was 218 kWh per ton. He urged that attention should be given to the design of furnaces in relation to the shape of the articles to be treated. The building of furnaces in the shape of a narrow or shallow trough or tunnel through which straight strips could be pushed or conveyed by conveyor chains would materially increase the efficiency of electrically-heated furnaces.

Mr. Otto Frick said that the problem of finding a suitable lining for non-ferrous metal furnaces did not offer greater difficulties than those already met with and overcome in connection with steel melting, notwithstanding that these difficulties were of a somewhat different character. For brass the problem had been solved already in a reliable and satisfact[ory] way; the lining of the first 120-kW brass furnace in the fact[ory] of A. B. Svenske Metallwerken, Vestersa, Sweden, promise[s] very long life. He described a Frick furnace, which operated [at] 130 kW, in Sweden, and gave perfect satisfaction in all [re]spects, producing 12 tons of brass of absolutely uniform ana[lys]is in 24 hours. Quick transfer of heat and reliable alloyi[ng] were secured without having to rely upon either "pinch" effect or on a V-shaped channel, simply by utilising the rota[ry] movement of the metal in the heating channel well known [to] all users of transformer furnaces. In order to keep the [600] kW, 600 kg., brass furnace hot, from 7 to 8 kW was requir[ed]. The total electrical losses in the furnace and step-up tra[ns]former remained at or below 3 per cent.

Dr. Walter Rosenhain, F.R.S., said that the economy [of] the melting process was not merely a question of the trans[fer] of energy from an electric current generator to the metal; [it] was also a function to some extent of the rate of loss of h[eat] from the container. If the metal container were of an un[de]sirable shape—for instance, a large ring—it was bound to l[ose] heat unduly fast. If it had to be subjected to a very viol[ent] temperature gradient by external cooling, the economy of [the] process would be likely to suffer. The Ajax-Wyatt furn[ace] seemed to be remarkably free from both these defects.

Mr. Campbell, replying to the discussion, said there [were] a considerable number of electric furnaces for annealing [in] this country of which he had experience, some of them be[ing] used for the continuous annealing of wire for submar[ine] cables, in which case it was necessary to work to within v[ery] close limits, and to anneal in an atmosphere of nitrogen. Th[ey] were giving completely satisfactory results. The whole of [the] wire in the Pacific cable, the longest in the world, [was] annealed electrically. Other furnaces of large dimensions h[ad] been erected for the heat treatment of aluminium for [the] Admiralty, and for various other operations of that sort. [In] the arc furnace there was a shallow bath and a large s[urface] area. With the high-frequency furnace he had not expec[ted] efficient refining, because the slag appeared to be cold, but [it] was in fact very hot on the under side, and the speed w[ith] which the metal was brought into contact with the slag [was] enormously greater than in any other furnace. He was c[er]tain that great improvements would be announced before l[ong] with regard to linings. The 600-lb. furnace was suitable [for] brass mills, but there was no reason why larger capacity f[ur]naces should not be used. Within a month or two furnaces [of] from 25 to 30 cwt. capacity would be working. The capac[ity] of the individual furnace depended largely upon the size of [the] shop, the work to be done.

Pulverised-Fuel Firing.

A review of the practice to date in the burning of powdered coal, particularly with regard to its influence on modern boiler design.

By E. KILBURN SCOTT, A.M.Inst.C.E., M.I.E.E.

(*Abstract of a paper read before the* Cleveland Institute of Engineers.)

THE "unit" system of pulverised firing is generally considered the most suitable for applying to existing boilers, including some of the internally-fired type, and it has also a great field for metallurgical furnaces, kilns, and so on. Coal must be dry if it is going to be powdered, because moist coal is difficult to grind, and not safe to store if the free moisture is above 2 or 3 per cent. Coal dryers are usually of three kinds, the rotating tubular type, the vertical type, and the vertical rotating steam dryer.

The first type usually consists of two tubes, one inside the other and upwards of 50 ft. long. The outer tube, which may be 6 to 8 ft. in diameter, is surrounded by a brickwork furnace and has a grate on one side for burning coal to get the necessary heat. The tubes are set at a slight slope from the horizontal, and are rotated slowly, like a cement kiln. The hot gases pass round the outside of the outer tube and then go up the inner tube, the coal being passed along the annular space between them. This type makes a great deal of noise and has the objection of requiring large floor space. The vertical-louvre type dryer is about 10 ft. in diameter and 20 ft. high, and the coal slides slowly down between louvres that permit part of the hot flue gases to pass twice across the path of the coal, and as the gases go through the interstices, they pick up the moisture. The steam dryer is certain in action and the heat can be regulated with great nicety. It consists of a steel casing about 10 ft. in diameter and 20 ft. high, inside of which a number of cast-iron disks are slowly revolved. They are heated with pipes that receive steam from the hollow vertical spindle. The coal is fed in at the top and after making nearly a complete revolution on the first disk is scraped off and pas[ses] down a chute to the next disk, and so on. Steam is bled fr[om] the main at full pressure, and the heat imparted to the [coal] causes the moisture to be carried off by a stream of air t[hat] is induced through the dryer by a fan, which delivers [the] moisture outside the building.

One of the best known grinding mills is the "Raymon[d]" which has its rollers inside a horizontal bull ring, set on a cast-iron base-plate, with tangential openings to allow air to pass inside the grinding chamber. The vertical central spin[dle] carries a number of steel ploughs at its lower end to stir [up] the coal and a spider at the upper end carries the vertic[al] journals of the rollers, of which there are usually four to [six]. Most modern mills are arranged for air separation, that is[, to] say, the fine particles of coal are swept forward by a continu[ous] current of air, which carries them up to a cyclone, where [the] particles of coal are swirled away from the air. When gri[nd]ing coal, the fine powder must be prevented from getti[ng] into the atmosphere, and all joints of machines and pipes m[ust] therefore be kept tight. In order to prevent wear on [the] blades of the air fan by the powdered fuel it is now becom[ing] the practice to place the fan in the return air pipe leadi[ng] to the mill.

In a recent form of feeder, known as the plate type, [the] powdered coal drops on to a cast-iron plate at the bottom [of] the storage bin, in which are two apertures spaced diagona[lly]. An agitator revolves over the top of the plate and the [pul]verised coal passes through the apertures on to a rotor cast[ing] which has fingers that distribute it to a Venturi tube, wh[ere]

meets a current of air. This air is preheated to prevent coal cking by the condensation of moisture. The vertical shaft rrying the agitator and rotor is driven through a worm and orm wheel by an electric motor, the speed of which can be ntrolled from a distant switchboard. The amount of coal n thus be regulated at each burner with great nicety. Plate eders have the advantage of taking less electric power, and ere is practically no chance of the coal "hanging," as was metimes the case with screw feeders.

It is usual for each boiler furnace to be fitted with a conlerable number of burners; a boiler burning 6 tons of fuel r hour may have six or eight. Fishtail burners are now e regular shape, and they are usually set about 2 ft. apart the suspended arch, the flat sides of the burners being at ght angles to the front wall. Owing to the draught of the imney, the resultant flame takes the form of a U, and it is et at intervals in its path by fresh supplies of preheated condary air, which issues from numerous ports in the front all. This secondary air is about 80 per cent. of the total.

When the walls of a combustion chamber are covered with ater tubes it is possible to have higher flame temperatures. ighly preheated air can also be used, and this is provided r a separate preheater. A special form of burner has been signed, having a separate pipe connection for the preheated r and two deflectors to direct this air into the coal and imary air stream at the moment it leaves the nozzle.

Intensive mixing of fuel and air in the furnace is a leading ctor in promoting rapid combustion, for it is necessary to ing the oxygen and carbon together, so that they can come quickly. By this means temperatures of above 2,500 g. F. are obtainable.

In order to get turbulence in the flame, designers are turng their attention to special burners; one of these, the Couch," has the mixture of powdered coal and primary air read outwards by a cone and secondary air jets, which enter om fan-shaped blades, impinge at right angles against the ne of coal, and give it a rotary motion. Experiments have own that up to 35,000 B.th.u. per cubic foot of combustion ace can be liberated per hour by this form of burner.

When powdered coal has to be transmitted for distances der 100 ft., it is usual to employ screw conveyors. For disnces above this pumps or blowers are employed. Powdered al can, of course, be carried in piping along with sufficient r for its combustion, but this is not very safe, and the usual an is to transmit it with only just sufficient air to fluidise e opal, as there is then no chance of back firing.

The Fuller Kinyon consists of a rapidly rotating screw to set e powdered coal in motion, combined with a fan to inject air fluidise it.

At the Ougree Marihage Steel Works, Belgium, a system lled the "Quigley" transmits pulverised coal for 2,300 ft. rough 4-in. piping which follows the contour of the ground, d at one point has a sharp change of elevation of 33 ft.

The increase in the size of boilers led to the Delrick arch, hich has a single layer of firebricks suspended from eel-girder bars. Another form, the Liptak, has two layers refractory bricks, the lower layer being suspended from e upper one, which is in turn suspended from the steel ructure. The refractory shapes or bricks are usually made a mixture containing a high percentage of alumina. A iler now being built for an English power station has water all tubes to take the place of the flat suspended arch, and vo layers of refractory bricks on the top of the tubes to se in the combustion chamber at that point.

The success of the water screen led to the idea of cometely covering the walls, and Mr. Murray, chief engineer, ell Gate power station, U.S.A., introduced the Murray "fin" be, which has strips of steel, 1½ in. wide and ¼ in. thick, welded along each side of the tubes so as to give ample space for them to be conveniently expanded into the headers.

The only backing of the tubes is a layer of asbestos about 2 in. thick.

In addition to water tubes, furnace walls are now also being fitted with steam superheater tubes, through which steam circulates at high velocity on its way from the boiler steam drum to the steam-pipe header. Such tubes are also used for superheating low-pressure steam. With furnace walls so built intensive mixing of the pulverised fuel and the combustion air may be increased to almost any extent, and the whole of the combustion space effectively utilised for combustion purposes.

The new power station at Peterborough is to have the boilers and turbo-generators under one roof without any dividing wall between them, and there are also no coal bins over the boilers, the powdered fuel being transmitted from a separate coal-preparation house direct to the boiler burners. When very high pressures are employed it is important to get the boiler close to the turbine, and this can be easily done when it is fired with powdered coal.

A boiler to give 240,000 lb. of steam per hour at a pressure of 1,200 lb. per sq. in., fired with pulverised fuel, has been recently started at the Lakeside power station of the Milwaukee Electric Light and Railway Co. The two steam drums, each 41½ ft. long, and the mud drum, 40 ft., are made from hollow forgings, machined inside and out. The boiler has 1,602 tubes, giving a heating surface of 28,532 sq. ft. After passing through the h.p. turbine, and becoming reduced to 300 lb. per sq. in., the steam is brought back to a reheater in the wall of the combustion chamber, where the temperature is raised to 720 deg. F. Across the furnace bottom there are 35 water screen tubes, giving a total screen area of 245 sq. ft.

The bin for the pulverised fuel has a capacity of 140 tons, and the fuel is fed by 12 screw feeders, driven by six variable-speed motors through 7-in. diameter pipes to 12 burners. The capacity of the feeders is 35,000 lb. of coal per hour, and the volume of the furnace is 30,100 cubic feet. The primary air has a pressure of 15 in. of water and a temperature of 300 deg. F. The secondary air is supplied through burners and ports in the front wall at a temperature of about 500 deg. F. and a pressure of about ½ in. of water.

The front wall of the combustion chamber is fitted with 70 fin tubes, the total area of which is 420 sq. ft.

The total heat-absorption surface of the boiler is 31,939 sq. ft., of which 3,407 sq. ft., or 10.7 per cent., represents the radiant-heat-absorption surface, not including the front row of the boiler tubes.

A boiler now being experimented with at the works of Messrs. Taylor Bros., Ltd., has its combustion chamber entirely surrounded by water wall-tubes, connected by headers, with the boiler drums at the top and bottom, the combustion chamber square, and the four walls covered with Murray fin tubes. The roof consists of plain tubes that connect the steam drums, and there are also four rows of tubes connecting the mud drums at the bottom.

The powdered coal and air enters the combustion chamber through two burners at each corner near the top. The products of combustion pass between the tubes at the bottom, and the gases turn upwards and pass through the superheater and preheater on their way to the chimney.

Tests have shown that about 40,000 B.th.u. can be liberated per cubic foot of combustion space per hour.

A boiler of this design is being made for the Commonwealth Edison Co. of Chicago, to give 125,000 lb. of steam per hour, 300 lb./sq. in., and two others are being made for the Brighton power station.

Scientific and Industrial Research.

Report of the Department for the Year 1925-6.

LAST week the report of the Committee of the Privy Council for Scientific and Industrial Research for the year 1925-26 was published (H.M. Stationery Office; nd. 2,782. Price 3s. net). It states that the estimated cost the programme of research for 1926-27, and of administraon, amounts to £442,877, as compared with £380,263 for e previous year. During the year Sir Richard Threlfall, r. J. H. Jeans, Sir William Ellis, Sir John Snell, and Sir hn Farmer retired from the Advisory Council on the cometion of their terms of appointment; Prof. H. C. H. Carnter, F.R.S., and Dr. G. C. Clayton, C.B.E., M.P., were pointed members of Council. Commenting on ten years' rk, the Committee endorses the view of the Advisory uncil that in the field of applied research the duty of the epartment is rather to stimulate than to replace private terprise, save in certain directions in which the expenditure of public funds is justified, as in the study of our fuel resources. The fear is expressed that in many cases industry has not investigated the possible applications of new discoveries in pure science likely to lead to new products or processes. Unless research has a practical objective it does not fall within the functions of the Department or, indeed, of industry itself; but industry is undoubtedly concerned with pure research as much as with applied research.

New research associations are being formed and will be assisted. The Committee has adhered to its policy of continuing to assist for a further five years those associations which have done good work, the grants being calculated on a diminishing scale so as to enable the industry gradually to assume full financial responsibility. Amongst other associations whose work has been investigated by independent experts, the British Cast-Iron Research Association has been

offered pound-for-pound grants for three years, and grants at half that rate for a further two years. The Research Association of British Rubber Manufacturers, and the British Refractories Research Association, are also receiving continued assistance. During the year grants to associations amounted to £88,216, and the balance of the Million Fund unexpended on March 31st, 1926, was £429,984. The uncommitted balance of the Fund was £144,647.

Fuel research has been delayed by the difficulties in the coal industry. Several systems of low-temperature carbonisation of coal have been brought to the stage of full-sized construction, and five of these have been tested by the Department. The view of the Royal Commission on the Coal Industry, that a survey of the heat, light, and power requirements of the country was called for, is cordially endorsed. The committee appointed by the Department to examine the Severn barrage proposal has reported in terms sufficiently favourable to justify an extension of the inquiry, and it has been decided to transfer its supervision to a sub-committee of the Committee of Civil Research, which includes members of the original Departmental Committee. The attention given to research as a means of developing the Empire, at the recent Imperial Conference, is mentioned with satisfaction.

The report of the Advisory Council to the Committee surveys the whole field of work covered during the ten years of the Department's existence, and emphasises the necessity of systematic investigation to enable industrial progress to be made; unfortunately, public opinion is not yet fully aroused to its necessity, but there have been many welcome signs of a change in attitude during the past ten years, and more research work is now carried out than ever before. Many prominent industrial firms are rapidly developing their scientific organisations. Greater expansion is necessary and a far greater co-ordination of effort. When an industry consists of a large number of comparatively small and independent firms, these cannot maintain separate research organisations sufficiently large to provide for their needs, nor is it in the general interests of the country that they should do so, for this would involve a great waste of money and effort in the attack of particular problems many times over. There are only two ways out of this difficulty—the formation of large industrial combines, and the encouragement of co-operative research.

Regarding the electrical industry, the Advisory Council says: "The electrical industry not only owes its origin to pure scientific research, but is assisted even now more than any other industry by researches carried out in universities and in Government establishments. Every university encourages the intensive study of electrical science; all the Service Departments spend large sums of money on electrical research, the majority of the results of which are available to industry; the National Physical Laboratory has always had an Electrical Department, and a building and equipment for the special study of high-tension problems is approaching completion. Under the Radio Research Board of the Department investigations have been carried out of direct importance to the electrical industry, and some of the results of the work are already being applied. Grants have also been given to independent investigation for electrical research; in particular, a large grant has been given to the Cavendish Laboratory, Cambridge, for fundamental work on intense magnetic fields. A British Electrical and Allied Industries Research Association has also been formed with the aid of large grants from the Department, and has been engaged for some years now on investigations of general importance to the industry. Finally, in the industry itself there has been a considerable expansion of scientific work since the war. The prominent electrical manufacturing firms have large research laboratories, and we hope that it is only a matter of time before these equal in achievement, if not in size, those of their principal foreign competitors. On the whole, the position is healthy; there is general recognition of the necessity for continuous research if progress is to be maintained independently of foreign countries. The British Electrical and Allied Industries Research Association deserves, however, far greater support from electrical supply companies, for much of its work is of great value to them. To take a comparatively simple instance, the investigations on the safe loading of underground cables, undertaken for the Association at the National Physical Laboratory, have shown the possibility of immediate economies in the electrical supply industry which, according to an independent estimate, are valued at some £250,000 a year. The work of the Association on switchgear and overhead transmission lines is of greater direct importance to supply companies than to manufacturers. We trust that there will be a far greater effort on the part of the supply undertakings to maintain the Association on an adequate financial basis. It will certainly be difficult to justify any continuance of Government grant to the Association after the present grant period ends in September, 1930. As we have said, the electrical industry receives more support in relation to its size and importance from independent and Government research than any other British industry. It has been comparatively prosperous throughout times of great difficulties in other industries, and there is every sign of a continuance of its prosperity for many years. It will only be really healthy when it relies on its own efforts to meet foreign competition, and does not look for further direct support from the taxpayer to aid its scientific development."

Dealing with industries generally, the Advisory Council lays stress on the value of co-operative research in the wid sense, and emphatically records the opinion that the i portance of a steady scientific policy increases in times adversity. The expenditure required to produce results direct industrial importance is trivial in relation to the va of the total output of an industry, and the view is expres that the system of voluntary contributions to co-operat research associations is inadequate; efforts are being m by some associations to introduce some kind of volunt or compulsory levy on raw material, on manufacture, or individual outputs.

In the class of so-called "key" industries, such as t manufacture of scientific instruments and of optical a scientific glassware, the expenditure on scientific and te nical research required to maintain a high standard and c tinuously to introduce improvements is comparatively v high, and these have been helped since the war by a tax imports and by considerable grants of money for scienti research.

Summarising its general policy, the Advisory Council ho that the Department is not justified in spending public fun continuously on work which is for the special benefit particular industries, and which should be carried out by t industries themselves if the results are to be applied efficien and quickly. The duty of the Department in these directio is rather to stimulate than to replace private initiative, a particularly to seek to reduce the gap between new scienti advances and industrial applications. Co-operative resear by means of research associations has been encouraged financial grants over a limited period, and the results sh that this policy has been a wise one. It has led not on to actual achievements which have been applied in industr but it has had a great effect in bringing the leaders of t industry face to face with the need for research, and th encouraging them to provide more directly for scientific wo needed for their own special requirements.

In all the measures adopted by the Department to car out or to promote industrial research, the primary purpo must be to secure the application of scientific knowledge industry. It is one of the most important parts of the D partment's own research organisation to establish utilisati sections for promoting the application of scientific and tec nical information in industry. The same function must discharged by research associations wherever they exis indeed, this function is regarded as being in many cas perhaps the most important function which the resear association can discharge.

A large part of the report is devoted to a summary the work done under the various research organisations of t Department during the year 1925-26, including the Nation Physical Laboratory, the Fuel Research Board, the Eng neering and Physics Co-ordinating Research Boards, the Rad Research Board, and the Illumination Research Committe In nine Appendices particulars are given of the Resear Boards and Committees of the Department, grants to resear workers, aided researches, finance, existing Research Associ tions, research in other parts of the Empire, publications researchers and Government employés, and department publications issued during the year.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Bognor Gas and Electricity Bill.

The Bill promoted by the Bognor Gaslight and Coke C was considered by a Committee of the House of Lords, ov which Earl Russell presided, on March 22nd.

Mr. Rowand Harker, K.C., said that the company supplie both gas and electricity, and the main objects of the Bill we to enable the name of the company to be changed to "Th Bognor Gas and Electricity Co."; to raise additional capita and to extend the limits for the supply of gas and electricit The amount of stock authorised up to the present time wa £104,700, and the Bill authorised £100,000 additional capita and increased borrowing powers.

Originally there were a number of opponents, but agre ments had been reached in most cases. There remained, hov ever, the petition of the Westhampnett Rural District Counc with regard to electricity supply. Part of the area of th rural district was within the existing limits of supply of th Bognor Co., and it was proposed to include further parishe The issue would emerge as to whether the company should b put under the obligation to supply electricity in certain place no matter what the cost would be to the company, irrespectiv of whether that supply would give any proper return on th capital outlay, and irrespective of what the effect of such a obligation would be upon the existing consumers of the com pany. At present there was no supply of electricity i Arundel, but Arundel wanted a supply, and the company wa anxious to give it. The generating station at Bognor wa small, and therefore the company was endeavouring to obtai a bulk supply, through the Chichester Corporation, from th Portsmouth Corporation. A new h.p. main would pas within fairly reasonable distance of certain small township within the Westhampnett Rural District, and if and when th company was satisfied that a reasonable demand for electricit

existed in those townships, it was proposed to tap the main and supply them. The petition of the Westhampnett Council pointed out that for over fourteen years the company had failed to exercise its powers in any of the parishes in the Rural District, although there was a demand. It was suggested that the company should be placed under an obligation to lay mains in the parishes at present within the area of supply within two years from the passing of the Bill. The company had inserted a clause, which it asked the Committee to approve, providing that if, after the expiration of five years from the passing of the Bill, it had not, in the opinion of the Electricity Commissioners, laid suitable and sufficient distributing mains for the supply of electricity in any parish added by this Bill to the existing limits, the local authority or any company or person could apply for powers to give such a supply, and providing for the repeal of the company's powers. That did not apply to the parishes already within the company's limits of supply. Since 1888 the Rural District Council had had power to apply for an Order enabling it to supply in the whole of its district, but it had not exercised that power.

A report from the Minister of Transport pointed out that in cases where extensions of area were sought by Special Order under the Electricity (Supply) Acts, it was usual for promoters to be placed under an obligation to carry out within two years a reasonable amount of compulsory works in the more populous portions of the extended areas, unless justification were shown that such an obligation should not be imposed. Counsel said that a clause had been inserted in the Bill placing an obligation upon the company within two years to lay down distributing mains reasonably suitable and sufficient for the purposes of a general supply of electricity in certain streets in the borough of Arundel. The report also pointed out that an application had been made to the Electricity Commissioners by the Electric Supply Corporation, Ltd., for a Special Order authorising the supply of electricity in an extensive area embracing the borough of Arundel, and some of the parishes it was now sought to add to the area of supply of the Bognor Co. Counsel informed the Committee, however, that the Corporation had not opposed the present Bill, and the Bognor Co. had not heard from it.

After hearing a great deal of evidence, the Committee decided that the parishes of Tangmere, Boxgrove, Eartham and Upwaltham should not be included within the company's limits of supply; that the company should be compelled to lay distributing mains in certain streets in Aldwick and Felpham within two years, and in certain streets in the parish of Clapton within three years. The gas clauses were approved.

Hastings Tramways Bill.

This Bill, which provides for the substitution of trolley vehicles for tramways by the Hastings Tramways Co., was approved by a Committee of the House of Lords last week. There was opposition from the Hastings Corporation, which expressed a preference for motor-buses rather than trolley vehicles. It suggested that the company should withdraw the Bill, on the undertaking that the Corporation would not oppose the preamble of a Bill enabling the company to run buses in Hastings. The company could not accept this, for financial and other reasons.

Colchester Corporation Bill.

This Bill, which proposes to substitute trolley vehicles for the existing tramways in Colchester, was approved by the unopposed Bills Committee of the House of Commons on March 23rd. It was explained by Mr. R. F. Parker, for the Corporation, that the existing tramways were authorised in 1901, and had been running ever since, but the time had come to consider whether they should be reconstructed, at great expense, or whether a more flexible and cheaper form of transport should be substituted. The Corporation had decided to substitute trolley vehicles. The borrowing powers asked for by the Bill are:—For trolley vehicles, £25,800; for electrical equipment, &c., £7,825; for the reconstruction of roads, £9,038; and for the adaptation of buildings for purposes of trolley vehicles, £200. Borrowing powers of £13,000 are also sought for the provision of omnibuses.

Overhead Transmission Lines.

On March 18th Sir D. Newton asked the Minister of Transport what number of applications were made by authorised undertakers for consent to the erection of overhead lines for the years ended March 31st, 1925, and 1926, respectively; and how many such applications had been made for the current year.

Colonel Ashley said that the number of applications received for the year ended March 31st, 1925, was 162 and for the following year 194. From April 1st, 1926, to March 18th, 1927, the number of applications received amounted to 322.

Wayleaves.

On March 18th, Sir D. Newton asked how many local inquiries in respect of wayleaves in connection with the placing of electric lines had been received during the current year; if delay had taken place in regard to inquiries into these matters; and how many officers had been appointed by the Ministry to deal with such questions.

Colonel Ashley said that five applications had been received during the current year. In one case the inquiry was delayed from February 9th to March 4th owing to the death of one of the parties. No official was definitely set apart for this work, individual appointments being made on each application.

Railway Electrification.

During a debate on the second reading of the London, Midland and Scottish Railway Bill on March 21st, a number of members complained of the inadequacy of the travelling facilities in the East End of London, and urged that the company should pay greater attention to the electrification of its lines and to the installation of electrical signalling.

Mr. Fielden, a director of the company, in reply, said that the company had asked its late chief engineer to inquire into the engineering problems in the London district. The question of electrification was one of them. One official was solely engaged in the consideration of schemes for meeting the future requirements of the traffic on the London and Southend sections; progressive electrification was one of them, and alterations and improvements at Broad Street were another. Steps were being taken to avoid delay owing to traffic movements, and additional running lines and facilities were being provided. The company was in process of adopting automatic signalling on the line between Barking and Bow. That work, it was hoped, would be completed by the summer.

Beam Wireless.

On March 22nd Sir W. Mitchell-Thomson informed Lt.-Commander Kenworthy that the "beam" wireless stations erected in this country for the Australian service had passed the seven-day test required by the contract and were about to be taken over by the Post Office. The sending station was at Grimsby and the receiving station at Skegness. The corresponding stations in Australia were at Ballan and Rockbank, near Melbourne; and it was proposed to operate the service between London and Melbourne. Many detailed arrangements had still to be made, and he could not yet state on what date the service would be opened to the public.

Wireless Operators.

On March 22nd Sir W. Mitchell-Thomson informed Mr. Day that the total number of certificates issued to ships' wireless operators during the 12 months ended March 1st, 1927, was 760.

Winding Gear in Collieries.

On March 22nd, Colonel Lane-Fox informed Mr. Paling that about 2,440 collieries had steam and 240 electric winding engines. In the five years 1922-26 58 accidents had occurred, causing injury to persons employed, including 14 deaths; since December 1st five such accidents had occurred, causing three deaths. One of the former, causing injury but not death, and none of the latter, occurred with an electric winder.

Correspondence.

***Correspondents should forward their communications* as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

Faults in Flexibles.

When I drew attention to this matter in your columns last year, in connection with a vacuum cleaner, no interest was taken; but at last people realise the dangers involved, not to mention the annoyance. But I notice that Messrs. Ward and Goldstone now recommend "Feraflex." I wrote to them about this at that time, and they then preferred another of their special wires, "anti-shock" flex, as "they did not consider 'Feraflex' altogether suitable." This is a little confusing, as they do not now mention "anti-shock" flex, though I am using it and have had no trouble since.

J. W. Meares.

Guildford, *March 27th*, 1927.

The Charges for Packages.

In your issue of March 18th Mr. W. Eric Jackson, LL.B., writes a very interesting article on this subject. In the second last paragraph, however, he states that the buyer may return the empty packages at the seller's expense. Strictly speaking, this is not the case, for our railway companies will accept empties only if consigned carriage-paid by consignor, and I have never heard of buyers issuing separate invoices to suppliers for the amount of carriage paid on empties returned by them. I shall be glad to have this point explained.

W. Jackson Harris.

Glasgow, *March 21st*, 1927.

In reply to your correspondent, Mr. W. Jackson Harris, I would say that where the delivery charges are to be borne by the buyer, as is usually the case, the cost of returning the empty package may be considered as part of the delivery charges. The seller bears the cost of making the goods deliverable, *i.e.*, packing them, and the buyer pays whatever other expenses are incidental to the process of delivery. Trade

custom also seems to operate in favour of charging the buyer with the carriage on the empty package. The rules of the railway companies do not affect the legal position. If a buyer is entitled to send back packages at the seller's expense he can charge him with what the railway company has charged. The buyer would be legally entitled to do this where the sale was "carriage free." In such cases no expense is to be borne by the buyer, and he can legally debit the seller with any expense incurred in returning empty packages.

W. Eric Jackson.

A Meter Problem.

With reference to the letter by "E.H.K.P.," which appeared in your issue of March 4th, it is somewhat surprising to find anyone expecting correct readings from instruments used with transformers other than those with which they have been calibrated.

If a discrepancy appeared in the readings in the original instance the only correct method of checking this was to install the new instruments with their transformers as a separate unit, leaving the old ones undisturbed.

Connecting up the old instruments, with the new, to the same transformers would probably have the double effect of not only affecting the old but the new instruments as well.

The remedy for the situation is either to recalibrate the old instruments with the new transformers or put the old ones in circuit again.

P. Oaks.

Blackheath, *March 19th*, 1927.

With reference to the correspondence resulting from my letter inserted in the Review of March 4th, may I encroach upon your space with the following information which I have since been successful in obtaining?

The enclosed table has been constructed from figures taken from the meters concerned. A similar set of readings for the portable meter is not available, because the Supply Co. locked that meter in a closed and sealed box. The only information I have been able to elicit is that the readings of the portable meter were fairly close to those of the Sangamo, but less in value.

	Sangamo.	Aron.		Difference.
		Max. demand,		
Week ending.	KWh.	KWh.	KW.	KWh.
11/1/27	—	7,690	178	—
18/1/27	—	8,070	178	—
25/1/27	—	7,750	168	—
1/2/27	10,580	6,860	138	3,720
8/2/27	10,870	6,690	138	4,180
15/2/27	11,110	9,660	209	1,450
22/2/27	9,980	9,270	192	710
1/3/27	10,500	10,060	—	440
8/3/27	10 090	9,760	—	330
15/3/37	9,740	9,460	—	280

It will be noticed that the first reading of the Sangamo is dated 1/2/27, and this is after it had recorded for a full working week. Simultaneously the Aron meter shows a sudden drop in both kWh and max. kW demand indications. Between 8/2/27 and 15/2/27 the cover of the Aron meter was removed, and some adjustment made to its interior, after which the max. kW returned to approximately the original readings, and the kWh approached more nearly to the Sangamo.

In my opinion, the only accurate and satisfactory method of testing the Aron equipment is to install the Sangamo complete equipment (upon its own transformers) independently of any other apparatus, as current transformers are most sensitive to alteration of the time-constant (X to R ratio) of their loads. Moreover, when the company concerned is one of the largest in London, one would expect the methods of its test department to be above criticism; surely it is only reasonable to suggest, when the accuracy of a meter is questioned, that the test should be as perfect as possible. The company has said no more with regard to charging for its presumed loss. I also cannot understand why, when the consumer is charged on a max. kVA basis, the max. kVA meter is ignored, and he is charged according to the indications of the max. kW as indicated by the Aron meter, although the power factor of the system is 0.8-0.85, and, according to a P.F. meter (connected by the company), lagging.

E. H. K.P.

March 19th, 1927.

The Salaries of Engineers.

In spite of the large number of communications already published on the subject of engineers' salaries, I feel bound to add my small contribution to the swelling chorus of protest. A glaring example is furnished by your "Situations Vacant" columns in the issue of March 25th. There we see vacancies advertised for positions as "Chief Engineers" in two workhouse institutions at salaries of such stupendous dimensions that the successful candidates will, no doubt, soon be able to fulfil the requirements necessary to obtain permanent positions as inmates. In this connection, too, it is noteworthy that the amounts which the guardians of these institutions are prepared to pay their employés, are strictly comparable with those which they "give away" to non-workers in the form of relief.

As one of the younger members of the electrical world, I think a word is necessary with reference to the salaries paid college-trained men, just emerging from their studies, blushin under their many academic successes. A rude shock awai them in the form of offers, few and far between, of positio carrying salaries which a well-trained office-boy would reje with contempt.

I think the position may be summed up by adapting t famous words of *Punch*:—

Advice to those about to become engineers:—Don't!

Advice to those who are engineers:—Give it up and t cat burglary.

Embryo.

March 26th, 1927.

In view of the interest of your readers in the scheme of t S.T.E. to raise both the remuneration and status of enginee may I be permitted to add my wee small voice to the chorus

Your correspondent who sums up our trouble as one of supp and demand, is surely right. It is that, and that only. Wh is the position outside engineering?

In those several kinds of businesses, *e.g.*, large distributi stores, hotels, breweries, amusements, silk stockings, &c., th have done well right throughout the general slump in o basic industries, is there any higher general wage and sala standard than obtains in those languishing industries, en neering, shipbuilding, mining, &c.? No, Sirs, we know the is not; salaries and wages are at a dead level throughout i dustry, quite regardless of the prosperity of the particul industry and the ability of its directors to pay high salarie The law of supply and demand inexorably operates. We the present generation are suffering from the unrestricte over-production of population of the last century. Would th there had been a Parents' Association on the lines of o modern Rubber Growers' Association, Tea Growers' Associ tion, &c. Even now, Sirs, our population is still increasing the rate of round about a million every four years, a large pr portion of them, no doubt, destined to be engineers, or shou I say, part-time engineers? What are we going to do with these people? Is the law of supply and demand going operate still more inexorably for our children, grown to eng neers, than even for us?

If the S.T.E. scheme could be realised, no doubt it wou help engineers by limiting their numbers, but only by pushi would-be engineers into other already overcrowded professio with consequent intensified competition between their me bers, with the usual dire results. I must confess myself pessimist, I see no way out—with our present size of pop lation.

Sociologist and Engineer.

March 26th, 1927.

The Register of Contractors

THE annual meeting of the National Register Electrical Installation Contractors was held at t Institution of Electrical Engineers on Mond last, Mr. P. V. Hunter, C.B.E., chairman, presidin The report of the Executive Committee which w presented made mention of a publicity campaign carri out during the year, and it was stated that a furth campaign was being embarked upon. The figures relati to registration showed that since the inception of the schen up to December 31st last there had been 1,173 applicatio Of these, 946 had been accepted, 116 declined, and 17 wit drawn, while 41 were still under investigation. The numb of registrations cancelled and names struck off the Regist was 52, only two cases being on account of bad workmanshi Since the end of the year a further 30 applications had be accepted. Mr. Purse's paper on "Registration," which w read at the Brighton Conference of the E.C.A. Allied Ass ciations, was reprinted and circulated to supply authoritie architects, consultants and others. There are now 86 loc advisory committees with their full complement of thr members, and 20 others are functioning, although not yet t to number. The following undertakings now place their i stallation work with registered contractors only:—Mancheste Hull, Wolverhampton, Bristol, Preston, Croydon, Newpo Cheltenham, West Hartlepool, South Shields, and the Ne castle-upon-Tyne Electric Supply Co., Ltd. It has been a ranged to issue renewal certificate slips to obviate the annu exchange of certificates. During the year three complain of bad workmanship were received. The Executive Co mittee decided that it could take no action in one case; in t second case the responsible contractors were struck off t register; and in the third case the firm went into liquidatio thus forestalling the cancellation of its certificate. The E.C. passed a resolution calling upon the Register to adopt a co of wiring rules, and a meeting is being arranged with t E.C.A. The retiring members of the Registration Boa were re-elected, but Mr. Barnett was elected in the place the retiring representative of the Electrical Wholesale Federation.

In replying to a criticism of the accounts, both the Chai man and Mr. W. R. Rawlings claimed that the Register w run in a very economical manner. Replying to Co Crompton, Mr. Hunter said that he had heard, unofficiall

hat the E.C.A. had decided to adopt a set of wiring rules. Ir. A. H. Dykes seconded the adoption of the report, and it vas carried.

A member asked for fuller definition of the local advisory ommittees' functions. Mr. H. J. Cash pointed out the resent need for propaganda, which should aim at showing hat registration did not increase costs. He regretted that it ad not proved possible for the Register to adopt the I.E.E. Viring Rules. No doubt their adoption would deplete the Register for a time, but those that were left could pay a arger subscription to make up for that. Mr. W. A. Shaw aid that many large firms were not yet on the Register; e was informed that there were 350 members of the E.C.A. ot yet registered. He suggested the certification of the ompetency of contractors by the municipal supply engineers, 'ho would then take a keener interest in the register. 'ol. Crompton said that the present I.E.E. Rules were ar too complicated, and they were only temporary. They eeded more easily understood rules. That was being done, nd he commended the summary produced by the E.C.A. or the use of its members. Mr. W. Cross said that there ere complaints that individuals had been put on the Register 'ho were not strictly electrical contractors. Many contractors onsidered that the business qualification requirements ould be stiffened up. He also urged the adoption of wiring ules. Mr. F. W. Purse thought that even the "small" an should be registered if he fully complied with the condi- ons; it was easy to cancel his registration if he proved ncompetent, which was all the worse for the man concerned. Ir. Hunter said that there was a member of the E.C.A. n every local advisory committee, which should prove a afeguard. The Executive Committee was more stringent in s requirements from the small man. Messrs. P. V. Hunter nd A. H. Dykes were re-elected chairman and vice-chairman spectively. The rule regarding the status of applicants was nended to enable the Executive to require candidates to sub- it particulars of past work. The members of the Executive ommittee, Messrs. Munro, Calvert and Rawlings, were re- ected. Mr. L. Gaster suggested that the Register should be a eans of enabling the placers of orders to look up the past ork of contractors. The chairman said that the Executive ould consider the matter, although he thought it was beyond ie scope of the Register. On the proposition of Mr. Purse, was resolved to subscribe five guineas to the I.E.E. enevolent Fund. Votes of thanks to Messrs. Cash and urse (the Scrutinising Committee) and the chairman con- nded the meeting.

Published Specifications.

mpiled expressly for this journal by a firm of Chartered Patent Agents. e numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1925.

21,846. "Transmission and reproduction of views, scenes, or images by res or wirelessly." Television, Ltd., and J. L. Baird. September 1st, 5. (266,564.)

31,215. "Electric lamps." R. C. Turner. December 9th, 1926. (267,054.)

31,940. "Electric glow-discharge lamps." Television, Ltd., and J. L. Baird. September 1st, 1925. (Divided application on 266,564.) (267,056.)

32,805. "Apparatus for feeding oil to high-tension electric cables." Pirelli & Co. June 12th, 1926. (Addition to 255,034.) (Divided application on 255,034.) (267,059.)

Trade Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from March 23rd :—

Magnet (design only). No. 471,778. Class 1. No. 471,779. Class 1 (lettering only). Chemical substances used in the manufacture of goods exclusively for electrical purposes.—General Electric Co., Ltd.

Televisor. No. 464,125. Class 8. Apparatus for use in transmitting views, scenes, or images to a distance by telegraphy.—J. L. Baird, The Lodge, Argyle Street, Helensburgh, Scotland.

Mer-tone (lettering and design). No. 474,831. Class 8. Loud speakers for radio-telephonic instruments.—London Radio Manufacturing Co., Ltd., 61, Borough Road, S.E.1.

Omiceon. No. 477,713. Class 8. Apparatus for use in radio-telegraphy and telephony.—W. L. Colassi and G. Ventura trading in co-partnership, 130, Fenchurch Street E.C.3.

Accident Prevention.

The Accident Prevention Department of the National Employers' Mutual General Insurance Association, Ltd., informs us that one of its member firms has just reported a reduction of accident loss by 87.5 per cent., on a man-hours-worked basis. The Department issues posters weekly, suitable for display in factories, and has started a monthly paper styled "Industrial Safety," an interesting 8-page journal containing a variety of information calculated to reduce the frequency of accidents. A note therein recommends the painting of crane hooks white, so that they are more easily seen and fewer heads are broken—unpainted, they are difficult to see against a dark background. Methods of preventing falls from ladders, on stairs, &c., are described, and the use of flashing electric signs to attract the attention of employés to safety "slogans" is said to have proved highly effective. Too much effort cannot be devoted to the prevention of accidents, and the Department is anxious to help all employers to that end.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

AUSTRALIA (Adelaide).—Bridge (£70,000); city engineer.
(Hobart, Tasmania).—Reconstruction Sandy Bay Baths; Corporation engineer.
AYRSHIRE.—Housing scheme (162), for the C.C.; the clerk, Ayr.
BARNSLEY.—Municipal wash-houses and Turkish baths; borough engineer. Casualty and out-patients' buildings, Beckett Hospital; C. F. Moxon, architect, Regent Buildings.
BARNSTAPLE.—Housing scheme (22), for the T.C.; borough surveyor.
BASINGSTOKE.—126 houses, Hackwood Road; borough engineer.
BEBINGTON (Birkenhead).—Church (£7,000), for the Wesleyan trustees; Rev. F. A. Speight.
BEESTON.—42 houses; U.D.C. surveyor.
BRADFORD.—Central improvement scheme, including six-storey block (over £200,000); W. Williamson, city architect.
BRIGHTON.—Reconstruction of station (£90,000), for the Southern Railway.
BROMLEY (Kent).—Houses (92), Bromley Park Garden Estate, for Hugh F. Thoburn. Seven blocks of flats (£13,720), for the T.C.; J. Elliman & Son, Ltd., builders.
BURSLEM.—Extensions marl works, High Lane; Mr. Wilkinson.
CHADDERTON.—Extension of works, Halliwell Street, for Ferranti, Ltd., electrical engineers.
CROYDON.—Extensions, High School; Girls' Public Day Schools Trust. Bank, Brighton Road; Midland Bank, Ltd. Kinema, High Street; R. Cromie, 73, Edgware Road, W.2. 24 shops and flats, Dovercourt Parade North; Robin & Wilsdon, 39, Maddox Street, W.1. Warehouse, 252, London Road; C. H. Ridge.
(Addiscombe).—Flats, Park Hill Road and Addiscombe Road; W. H. Merret & Sons, Carshalton Road, Sutton.
DERBY.—Church (£6,000), for Junction Street Baptist Church; J. Wills & Sons, architect.
DONCASTER.—Houses (80), Bawtry, for the R.D.C.; Ward and Sons, builders, Maltby.
EASTBOURNE.—Additions, Victoria Hotel, Latimer Road; A. Ford, architect.
EDINBURGH.—Extensions at dancing academy, 22 and 24, Albany Street; G. Dickson.
FALKIRK.—Extensions at foundry (£1,400), for Messrs. R. and A. Main, Gothic Iron Works, Camelon; the manager. Reconstruction scheme for Falkirk and Counties Savings Bank (£9,100); J. G. Callander, architect, Royal Bank Buildings.
GILDERSOME.—Rag and mungo warehouse, for W. Morris, Springfield Mills; W. Wilby, Council House.
GRANGEMOUTH.—Reconstruction of buildings for Macpherson & McLaren, timber merchants; Wilson & Tait, architects.
GREENOCK.—Super-kinema, with café and dance hall, for Greenock Picture Palace Company; the secretary.
GRINDLEFORD (Sheffield).—Public hall (£6,000); Major Ross-Innes, President, Public Hall Committee.
GLASGOW.—Clinic, Kennedy Street; medical officer of health.
HAMPTON WICK.—Parish hall (£5,073), for St. John's parish; A. J. Hardwick, architect, Eagle Chambers, Kingston-on-Thames; Bernard & Picket, builders, Wallington.
HUNSLET.—Shed, Stourton Works, for Bramley Engineering Co., Ltd.; J. A. Webster, architect, 12, Hanley View, Bramley.
IRISH FREE STATE.—(Clonakilty, Co. Cork).—Reconstruction of wing at the County Home for the W. Cork County Board of Health; J. J. Crowley, architect.
(Skibbereen, Co. Cork).—Hospital for the West Cork County Board of Health; J. J. Crowley, architect, Clonakilty.
(Cork).—Farm buildings, dairy, and dairy institute, University College; H. H. Hill, 22, George's Street, architect.
(Limerick).—Dock extension (£150,000), for the Harbour Board.
KINROSS.—Additions to Green Hotel (electric lighting and central heating); Sir Basil Montgomery, director, Green Hotel, Kinross, Co., Ltd.
LONDON (Hackney, E.).—Rehousing scheme, Wells Street; L.C.C. architect.
(Stepney, E.).—89 tenements and 10 shops, Vallance Road; borough engineer.
(Hornsey, N.).—Elementary School, Coldfall site; Education Committee.
(Stoke Newington, N.)—Workshop extensions, 166-168, High Street; Eley & Allen.
(Wood Green, N.W.).—Elementary School, Albert Road; Education Committee.
(Battersea, S.W.).—Seventh block of tenements, Plough Road; borough engineer.
(Brentford, W.).—Houses on Gunnersbury Park Estate; Douglas Smith & Barley. 10 shops, Lionel Road; E. Haydon. Sports pavilion, Metropolitan Railway Works, Acton Town; W. Downs, Ltd. Factory, Great West Road. Industrial Constructions, Ltd.
LYTHAM ST. ANNES.—80 houses on three estates; borough engineer.
MAIDSTONE.—Schools (£29,000), Loose, for the borough E.C.; T. F. Bunting, borough surveyor.
MALVERN.—Additional housing scheme (34), for the U.D.C.; W. O. Thorp, surveyor.
NEWCASTLE.—Shopping centre, Walker housing estate; city engineer.
NEWTON-IN-MAKERFIELD.—Housing scheme (154), South Mesnes; J. Elson, architect, Market Chambers, Earlestown.
NORTHOP HALL (Flintshire).—Institute, for the Miners' Welfare Committee; F. A. Roberts, architect, Earl Chambers, Mold.
OLD FLETTON (Peterborough).—Housing scheme (120), for the U.D.C.; H. W. Hawkins, architect.
PAIGNTON.—Hospital accommodation; U.D.C. surveyor.
PENKRIDGE (Staffs).—Wesleyan Church, Wolverhampton Road; F. Jones, Otherby Cottage.
PENRITH.—Improvements, Market Hall; U.D.C. surveyor.
PITSTONE (near Aylesbury).—Cement works, Associated Engineering & Finance, Ltd., London, promoters.
RISHWORTH.—Church of St. John the Divine; Walsh and Maddock, architects, Halifax.
ROCHDALE.—Offices and showrooms, Samuel Street, for Electricity Department (£20,000); borough engineer.
ROTHERHAM.—Sewage works, for R.D.C.; C. O. Rawstron, engineer and surveyor, Grove Road, Moorgate.
RYDE (I. of W.).—Pavilion, Eastern Esplanade; borough engineer.
ST. HELENS.—600 houses, various estates; borough engineer.
SHIPLEY.—Extensions, wool warehouse, Otley Road; Wicksteed & Andrea.
SHREWSBURY.—Museum alterations; Curator.
SKEGNESS.—Secondary Schools, for Lindsey E.C.; director of education, Lincoln.
SOUTH AFRICA (Cape Town).—Schemes to cost £500,000 for various improvements; city engineer.
SOUTHEND-ON-SEA.—School (800 places), for the borough E.C.; A. B. Kelly, director of education. Sanatorium extensions, for the T.C.; borough surveyor.
STIRLINGSHIRE.—Hall at Fallin for West Stirlingshire Unionist Association; the secretary, Stirling.
STOKE-ON-TRENT (Hanley).—Temporary art gallery, School of Art; city engineer. 196 houses, Stoke Lodge Estate; Sutton Trustees. Office accommodation, engineers' department; city engineer.
SWANSEA.—Shops and offices, Union Street and Orange Street; W. C. Phillips-Powell, Cardiff.
THORNTON HEATH.—179 houses, Dixon Road, and other streets; W. H. Aston, Dixon Road.
TORQUAY.—Alterations, Princess Hall, Princess Street; Trustees.
WALSALL.—Additional 536 houses, for the T.C.; borough surveyor.
WALTON-ON-THAMES.—Houses (78), for the U.D.C.; David Weston & Co., Ltd., builders, Blackfriars House, New Bridge Street, London.
WELLINGBOROUGH.—Infirmary and extensions to nurses' block, for the B.G.; Talbot, Brown & Misher, architects, Burystead Place.
WHITEFIELD.—Housing scheme (38), Nipper Lane; C. F. Porter, clerk to U.D.C.
WITTERSHAM (Kent).—Residence, for Mr. Jowett, K.C.
WOLVERHAMPTON.—Infant welfare clinic, Lea Road, for the T.C.; town clerk. Block of business premises, Victoria Street, for Horton's Estates, Ltd.
WORSBOROUGH.—Housing scheme (36), Ward Green, for the U.D.C.; T. Shield, surveyor.

The
Electrical Review

VOL. C. APRIL 8, 1927. No. 2,576.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Canada and Chicago.

THERE are men connected with the British electrical industry who have devoted so many years' thought to the subject of our electrical export trade with Canada that it has become one of their life problems.

Interest in the situation has occurred in waves during the past twenty years and more. It is only typical of the dogged persistence and perseverance of our race that every year or two new men have come forward filled with determination to surmount the peculiar difficulties and to find ways for securing to British electrical products their due recognition and adoption. The vastness of Canada, the immensity of the scope offered to our people through the great national resources of a new world, and the ever-increasing need for population-relief for the Motherland—all these and many other considerations have surrounded the Dominion with an atmosphere of romance and that spirit has naturally had associated with it a home desire to do better business with our kith and kin there, finding increasing employment for our people.

More electrical men have visited Canada to investigate British electrical trade possibilities than have gone to any other electrical market—that is, judging by the number of them who have discussed their experiences with us—yet the actual progress made during a lengthy period has amounted to so little. Also, more electrical men from Canada have conversed with us here on the chances of securing British trade agencies there than have come from any other market, though visitors from Australia have run them pretty close. Many have been the efforts made by private individuals, by co-operating companies, and by associations, to promote new trade, but the actual advance made has been far from commensurate with the effort taken.

Only the newest entrants to the industry need to ask: "Why is it?" Sometimes it is said that our manufacturers have been lacking in enterprise—have neglected the market; this we know is not so in a number of cases. We have too close a knowledge of their endeavours to credit that statement to-day. It is true that the effort in certain instances has been

only half-hearted, but this has been due to the impression, not without justification, that there were handicaps in the Canadian market which existed in no other part of the world save the United States. Therefore, when there were many more promising fields open to them, our firms used their enterprise where it was more likely to bring a reward. Why bang your head against a stone wall in Canada when other countries give easier access? But the acceptance of that state of things as inevitable does not last long with British manufacturers, and it is gratifying to be able to congratulate those who decline to sit down despairingly and do nothing. Grievances have continued too long already, and they will only be removed by persistence and publicity. All honour to those who take the initiative in bringing about a change!

We venture the view that whatever other handicaps there may or may not have been, the one that has been directly and *indirectly* the most serious deterrent to British progress has been the influence of the Chicago Board of Underwriters through its Electrical Rules and Regulations. The attitude is not free from what looks very much like definite obstruction, for certainly from what we hear, irritating difficulties are placed in the way of those seeking approval for British manufactures which are superior to much other product that is permitted or approved. However real this Underwriters' difficulty has been in actual fact—and its seriousness has varied in degree with different products—there has always been a Chicago smoke pall over Canada which has had a restraining influence upon our trading concerns.

With the Electrical Review and its readers and contributors the whole subject is one of long standing. We have supported all efforts that have been made to bring relief to British firms. Fourteen years ago, as the result of operations in connection with which we and our representatives took no small part, we published a report by Mr. C. Hamilton Wickes, then H.M. Trade Commissioner in Canada, in which the effect of the Underwriters' Code upon British trade was dealt with in great detail. Since that date (Elec. Rev., January, 1913) many things have happened, but British traders' wrists are still shackled by Chicago. No British or Canadian trader can feel that we are being fairly dealt with until this restraint is either removed or substantially modified.

We publish two articles to-day in which this and other aspects of the Canadian situation are reviewed, and we hope that the attention that is now being given to the subject will bring about the desired result—reasonable approval of British electrical material and manufactures on the basis of quality, safety, and other merits, taking the place of rejection through prejudice or irritating objections in matters of unimportant detail.

Electricity in Agriculture.

We all know the reputation of "hope deferred," and some of our readers who have followed, perhaps with waning interest, our quarter-of-a-century's advocacy of the application of electricity to farming, may have little faith in the future of that branch of electrical activity. But the omens are favourable, and there are good reasons for believing that the subject will come into prominence in the not-distant future. That the leaders of political parties are interested in the extension of electricity supply to the rural areas is, of course, well known, but we do not attach much importance to that fact; the matter is now in the hands of the Central Electricity Board and will be dealt with as and when conditions permit of it—not much is to be expected from that quarter for some years to come.

But in other ways real progress is being made, which should make itself felt quite independently of State action. The chief obstacles to the application of electricity to farming have been the relatively high cost of the supply mains and the low value of the small and intermittent demand for electricity in farming operations, two factors which entail a high price for energy and thus restrict consumption. So long as the lighting of the farmhouse and the occasional driving of a few small motors constitute the farm load, the business cannot prosper. The remedy is to be found in the heavier applications of electric power, namely, to ploughing, harvesting, &c. Elsewhere in this issue Mr. R. Borlase Matthews gives an account of a remarkable development, on sound commercial lines, of the artificial drying of crops, with the aid of power-driven machinery, which will greatly increase the duration as well as the magnitude of the farming demand. We have reason to believe, too, that the system of electric ploughing devised by Major A. McDowall, which has been described in our columns, has aroused practical interest in influential quarters and is being closely investigated; this system permits of the electric tractor being used for harrowing and other cultural processes involving haulage on the land—an important feature, because it is of little use to replace horses for ploughing if they must still be retained for other operations. Again, the extremely interesting and instructive lectures delivered at various centres in Great Britain and Ireland last year by Dr. A. Ekström made it clear that a supply of electricity immensely facilitated agricultural operations, and that in Sweden this agency was eagerly availed of by the farmers. Another favourable indication is the strong movement towards the use of electric cooking and heating apparatus, which, stimulated by the coal shortage, and fostered by the E.D.A.-E.L.M.A. campaign, is continually gaining strength and will inevitably be felt in rural areas.

Hence the tendency is towards removing the obstacle of small and fitful demand, and obviously, amendment in this respect diminishes the importance of the cost of overhead lines—here, as elsewhere, improvement in load factor is an infallible remedy for high capital charges. If now the Electricity Commissioners would take measures to facilitate the erection of cheap overhead lines in rural areas, a further important advantage would be gained. The development of the rural load was largely relied upon by the Government advocates of the Electricity Bill as a means of improving the general load factor, and they were reminded of it in the House of Commons twice last week.

Hackneyed though the subject may be, we must insist upon its importance; every endeavour should be made to educate public opinion and to pave the way to development in this direction.

Anglo-Australian Wireless Telegraphy.

To-day, we learn, the wireless "beam" service between the Home country and Australia will be opened for public traffic. This is the first wireless channel for regular communication between the two countries on a commercial basis to be brought into existence; it is the longest direct telegraph service in the world. It has a duplex capacity of no less than 100,000,000 words per annum, and is available by day and night.

Do we fully realise the meaning of this stupendous achievement? Even five years ago the feat was utterly impossible—a mere dream of the future, if foreseen at all. We British are only too ready to find fault with ourselves, but slow to take credit for our triumphs. Let us try to view this event in its true light: it is, as we have said, a stupendous achievement, worthy to rank with any of the marvels of science with which the past half-century is adorned. It is the work of two associated concerns—Marconi's Wireless Telegraph Co., Ltd., and Amalgamated Wireless (Australasia), Ltd.—and has been developed under the personal guidance and supervision of Senatore G. Marconi, with the benevolent support of the British and Australian Governments. To all these, but especially to Mr. Marconi himself, we offer our heartiest congratulations.

Electrical Development at Ilford.

The conversion of the 1,000-kW manually-operated rotary sub-station at Goodmayes to automatic working, utilising the existing machines and introducing some new and interesting features in automatic installation work.

An official inspection of the electricity works and sub-stations of the Ilford electricity supply undertaking on Saturday last marked the completion of an interesting job at Goodmayes, and an important stage in both the development of electricity supply at Ilford and the installation of automatic sub-station equipment generally.

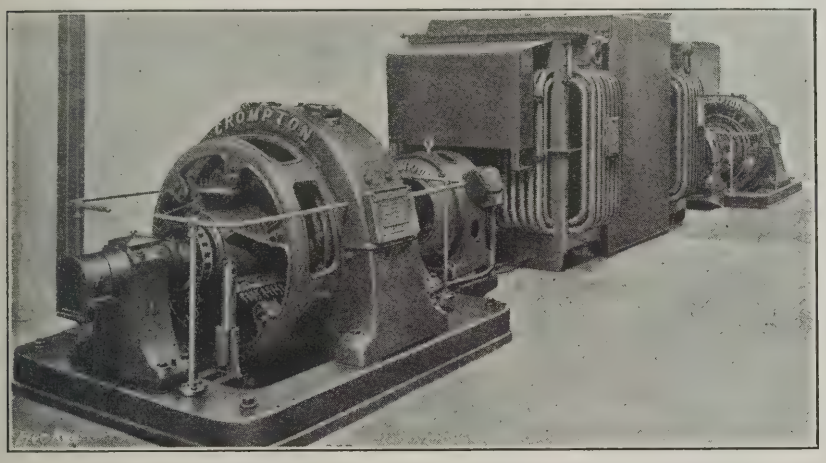

Fig. 1.—Rotaries and Transformers.

The Goodmayes rotary-convertor sub-station, which was up to a few months ago manually operated (Electrical Review, April 30th, 1926, p. 688), has now been converted for either full-automatic or remote-control working. The existing plant of the "sub" has been utilised practically in full for the new scheme, the only alterations being the provision of thermostats and other minor apparatus on the machines and transformers, to give the more complete protection necessary, the replacement of the main h.p. and l.p. circuit breakers, and, of course, the addition of the actual apparatus for automatic control.

The scheme is of increased interest in that it is believed to be the first of its kind where the machines can be guaranteed definitely to run up with the correct polarity for synchronising. Each convertor is run up to nearly full speed by a pony motor, when synchronising current is supplied by means of a special transformer. This current is within the limits necessary to avoid any reaction on the phase sequence built up in the machine itself, under the influence of the driving motor, but is sufficient to bring the machine definitely into step

The sub-station works in conjunction with two ring-main systems and is fed at 6,600 V, 3-phase, supplying at 500 V d.c. to the local networks.

Two standard 6-phase, 500-kW Crompton rotary convertors, directly coupled to pony motors for starting, are installed, and receive the incoming supply at 355 V from two 3- to 6-phase British Electric transformers. These are equipped with coil tappings for 2½ to 5 per cent., above or below, voltage regulation. Fig. 1 shows the rotaries and the transformers. The h.p. switchgear, fig. 2 left, is of the cubicle truck type, duplicate busbars with the necessary change-over switches being provided. The equipment includes two incoming, two transformer, and one p.l. panels, a.c. being used for street lighting in the district. As already indicated, the old transformer switches have been replaced by others suitable for automatic working; these are interlocked with the trucks, but the interlocking is so arranged that it is closed by the switch but can only be opened manually. The h.p. and l.p. breakers, a.c. and d.c., are so interconnected, through lock-out relays, that in the event of a fault on either the a.c. or d.c. system the breaker on the other side is thrown out. A separate flat-type switchboard, fig. 3 and fig. 2 centre, accommodates the automatic equipment.

With a definite drop of voltage across the d.c. bars, a governor relay is energised and closes an a.c. low-voltage contactor which, if the a.c. pressure is up to normal, closes a governor contactor, thereby completing the operating circuit to a timing motor. This, with the rest of the sequence control apparatus for

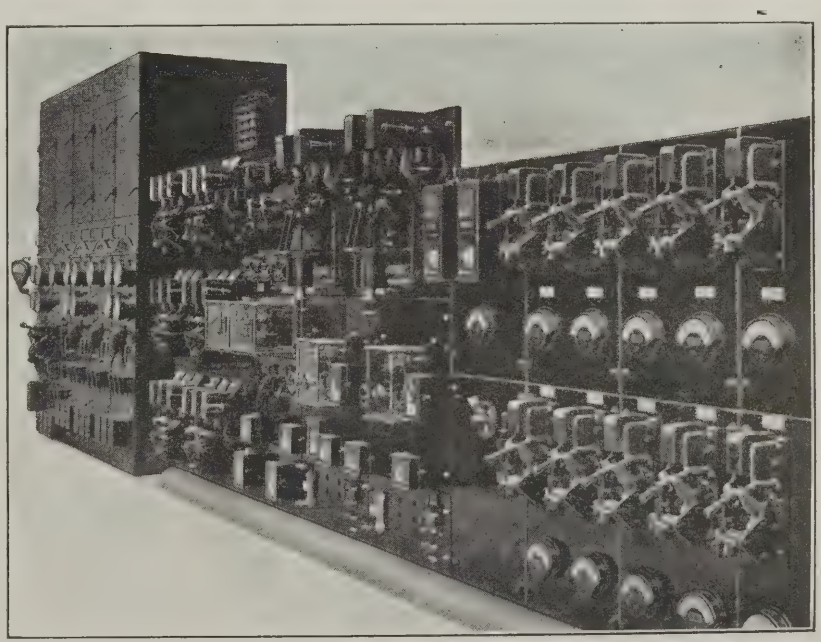

Fig. 2.—Complete Sub-station Switchgear.

each machine, is housed in a glass case, the whole being of a very substantial design. The timing motor, through a suitable train of gearing, drives a common shaft to which are fitted a number of contacts and a

system of magnetic clutches for operating, in the correct sequence, the various circuit-breaker relays. A hold-on coil is also fitted, and is closed simultaneously with the first clutch. This is energised as long as the machine is running, but as soon as the latter is stopped it is de-energised and allows the timing mechanism to return to the "off" position. After a definite time delay of 10 seconds, the first contact switch is closed, providing an alternative path for the operating current, the main governor relay remaining closed, whether the d.c. busbar voltage is normal or not. After a further delay of 5 seconds, the second timing

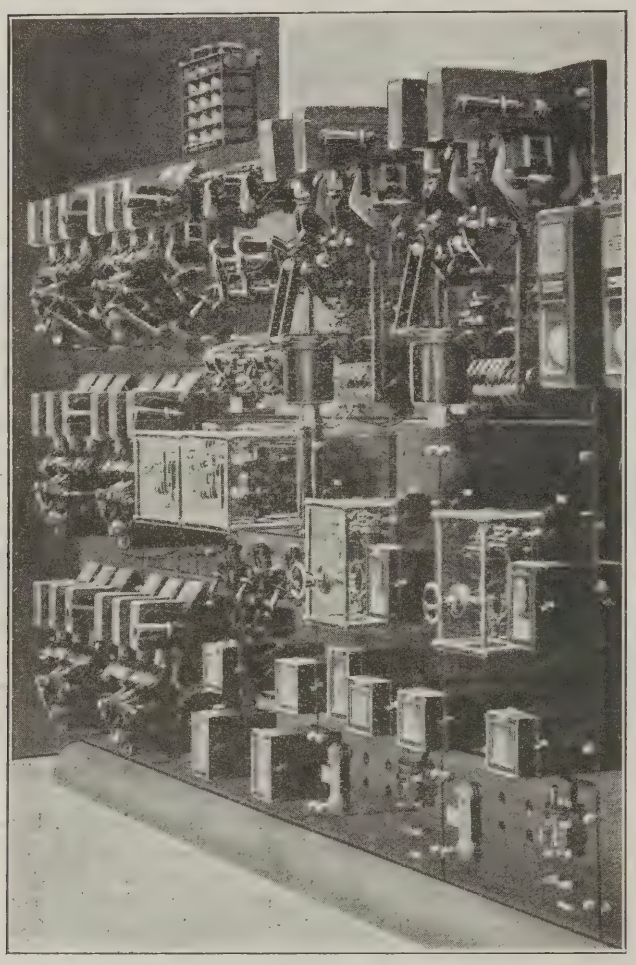

Fig. 3.—Automatic Switchgear.

switch closes and completes the supply to the main operating solenoid of the a.c. oil switch which connects the main transformer to the a.c. system.

With the oil switch closed, a contact switch completes the operating circuit for the coil of the first starting contactor: this is thrown in and the pony motor is connected to the supply, starts, and runs the rotary up to nearly synchronous speed. After a further time delay of 40 sec. another switch of the timing mechanism closes and operates the main synchronising contactor. This connects the rotary convertor to the special synchronising transformer, fig. 3 top left. Another lapse of five seconds, and the last timing switch closes the running contactor, connecting the synchronised rotary to the a.c. system, and at the same time opening the pony-motor and synchronising contactors.

The machine is now self-excited, and running at the correct speed, the supply being carried through polarised and correct-voltage relays. As the latter closes at the correct pressure, the main solenoid of the d.c. breaker is excited, connecting the convertor to the d.c. busbars. This operation connects the supply through the governor relay, which, with the increased pressure, opens and disconnects the timing motor and mechanism. Each machine is started up in a similar manner, duplicate equipment being provided for each, except that the timing mechanism of the second or any subsequent rotary is brought into operation by means of a d.c. loading relay, set, of course, at a predetermined load value. Underload relays provide for the shutting down of the machines. Each of these, on a predetermined loading, connects the timing mechanism in the reverse direction, and the machine is shut down after a time-delay of 15 minutes. To ensure against a polarity reversal on the d.c. side, a suitable relay, interconnected with the lock-out relay, is installed for each machine. Overload, reverse-current and no-volt relays are installed in addition to the other protective devices which have been mentioned. Provision is also made for the machine to shut down should the d.c. breaker fail to close within 5 min. of the completion of the previous sequence operations. A system of sequence switches enables the machines to start up automatically in any order.

For the remote control of the sub-station, a small pilot control board, fig. 4, is housed in the main generating station and enables the operator to stop or start at will either of the rotaries, and also to see at a glance which, if any, of the machines is running. The pilot board is equipped with two indicators and two two-way switches, one of each for each machine. Each indicator is connected to the d.c. bars at the generating station and by means of a pilot wire to the neutral at the sub-station end. A differential relay is employed in conjunction with the remote control apparatus, and operates the timing mechanism to start or stop the rotary according to the position of the control switch. By the insertion of additional resistance in the indicator circuit when the rotary is stopped, different scale deflections are obtained for "run" and "stop," and the scale is marked accordingly.

Arrangements are made for the hand control of the whole of the equipment in the case of emergency.

A particularly interesting feature of the equipment is the automatic voltage regulation. A shunt field regulator is provided with a pressure relay which has its main coil connected directly across the d.c. terminals of the machine. A central contact arm will, according to its position, make contact with either of two terminals of two operating coils equipped with plungers. The plungers are coupled by suitable driving mechanism to a common disk. According to the

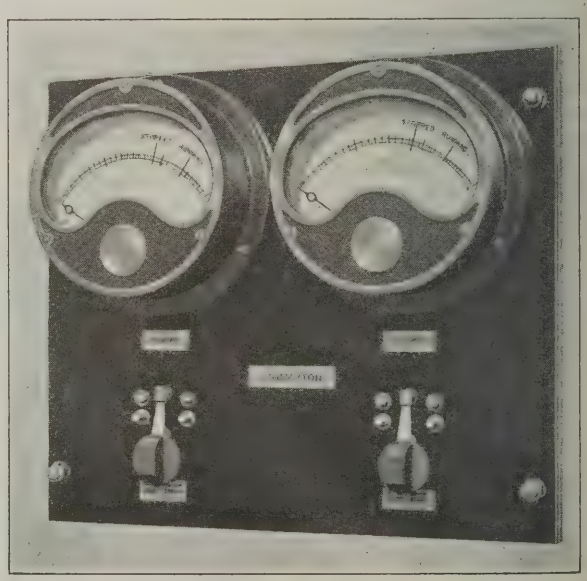

Fig. 4.—Remote Control Board.

direction of travel of the disk, the regulator will be operated to increase or decrease the pressure. It is claimed that the apparatus will result in a pressure accuracy of within 2 per cent. either way.

The load balancing is effected by means of a relay governor controlled by the busbar pressure.

The whole of the work on the change-over scheme has been carried out by Messrs. Crompton & Co., Ltd., under the direction of Mr. A. H. Shaw, M.I.E.E., borough electrical engineer, and most of the automatic equipment was supplied by Messrs. Whipp & Bourne, Ltd.

Electro Farming.

A new continuous crop-drying process, which offers the prospect of an attractive load for the central station and prosperity for the farm.

By R. BORLASE MATTHEWS, Wh.Ex., A.M.Inst.C.E., M.I.E.E., F.R.Ac.S.

NOT only is the problem of haymaking by artificial methods receiving renewed attention in this country, but American engineers are also seriously studying the proposition. Mr. Arthur J. Mason, who was one of the leading American engineers in developing mechanical methods in the steel industry, has been studying and experimenting on the hay-drying problem for the past fourteen years, and has spent over £20,000 in developing a mechanical system for handling and drying crops on his own farm at Flossmor, near Chicago, Illinois. During last season, the first commercial plant was installed on the Walker-Gordon Dairy Farms at Plainsboro', New Jersey, on which there are 3,000 head of cattle, consuming a great deal of fodder.

It might be of interest to explain how Mr. Mason approached the problem. In the first place he was struck by the lack of continuity of operation in agricultural work; for instance, haymaking takes on an average only a few days a year, and all the haymaking machinery lies idle for the rest of the time; and secondly, he was impressed by the fact that artificial drying had displaced natural drying in practically every industry except agriculture. Though this may not occasion any surprise to the engineer, it is most certainly a very strange gospel to the average farmer. It was only a short time ago that the author, when delivering a lecture on his method of artificially curing hay, was taken to task by a practical farmer because the new system he advocated involved the spending of money in doing something that Nature would do for nothing. Of course this is not the view taken by all farmers, but it is general enough to make it necessary to warn engineers of the fact and so make them realise the importance of demonstrating to the farmer that what has been done for other industries can be done for agriculture. The farmer must also be taught that the secret of low costs in the making of bricks, cement, salt and similar products lies in the fact that they can be made on any day in any season and that it is not necessary to wait for the sun to appear before the moisture can be extracted. Important as this change was in these industries, it is far more important in agriculture. Under the old system, say with bricks, those that could not be made one day could always be made at a more favourable time, and every stoppage owing to weather conditions only postponed the operation (and incidentally delayed and restricted deliveries and reduced profits). In the case, however, of farming, apart from the losses cited, if the crop is not cut at the correct time, a great deal of its value is lost, and if the weather is unfavourable, the crop is often ruined.

Not only is an artificial method necessary to improve present practice, but a change of method would open up tremendous possibilities; for instance, there are crops such as lucerne, which grows in abundance in damp climates, yet the very conditions which are favourable to its growth are dead against its successful harvesting; this is, no doubt, why so little lucerne is grown in this country. It is one of the most profitable of crops; a good acre of it will support three times as many cattle as an acre of any other crop. It also binds the land together and enriches it by a process of fixing nitrogen by nodules on the roots. It is claimed by Mr. Mason that at least two, and sometimes three, crops could be grown in one season. Of course, these could not be harvested in the ordinary way, but if mechanical methods were introduced which could cut, carry off and dry the crop in a short time, this would be possible. In fact, Mr. Mason has already done it. He is now farming 600 acres in Illinois, and the crops are on their way to market within a few hours of the time they were growing in the fields.

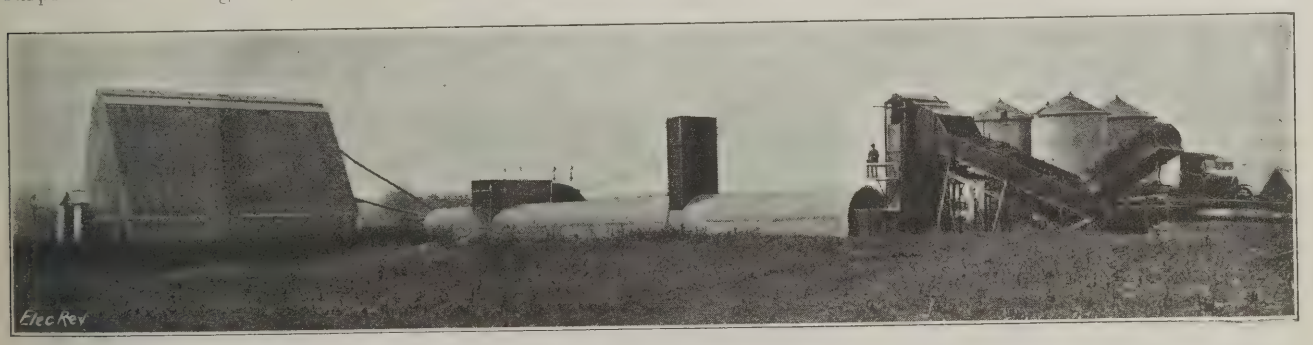

Fig. 1.—The Mason Continuous Hay-drying Plant.

A modified harvesting machine which is drawn by a tractor cuts the crop, chops it into lengths not exceeding 9 in. and delivers it automatically, by means of a special elevator which forms a part of the machine, into a lorry with a capacious steel tipping body about 8 ft. wide, which is driven alongside the harvester. When the lorry is full, another takes its place alongside the harvester, while the loaded one goes off to the drying plant. As an area of 600 acres is a large piece of land, it will mean a haul of 2 to 3 miles, on the average, hence one harvesting machine will probably keep three lorries fully occupied. The crop is tipped from each lorry on to an elevator (fig. 1, right) which is operated by a 10-h.p. electric motor; this carries the crop up to a height of about 20 feet. From here it passes through some spiked rollers or beaters, where it is combed and prepared into an endless mattress of uniform texture, 8 ft. wide and about 10 in. thick. This mattress, which fits closely to the side of the container, is then delivered by a chute on to a horizontal conveyor band, 160 feet in length, which is driven at a speed of about five ft. per min. by a 10-h.p. motor. This conveyor, with the exception of ten feet at each end, is enclosed in a drying tunnel about 8 feet high, made of corrugated, curved,

galvanised sheets (fig. 1, centre). The rectangular vertical structure in the centre is the discharge stack for the used air and gases. The hot-air fan is positioned at the far end of the tunnel (fig. 2, left centre). A floating door which rests on the crop is placed at each end of the tunnel (fig. 3), and another is placed at 60 feet from the finishing end door, so as to cut off the inlet heated air from the escape stack. Heated air at a temperature of about 250 to 275 deg. F. (or for non-leguminous crops, up to 400 deg. F.) is blown in at the finishing end, over the top of the crop. An 80,000-cu. ft. fan, driven by a 30-h.p. motor, is employed for this work. The air is heated directly by an anthracite coal fire. As this coal is free from smoke, sulphur and deleterious fumes, there is no objection to this method. With other fuels, such as ordinary coal, coke, or oil, only indirect heating can be employed, which, of course, is less efficient. About two pounds of dried crop are obtained per pound of anthracite coal consumed, or 20 tons of crop for 8½ tons of coal per day of ten hours. By the time the air gets to the inlet end of the conveyor, its temperature has fallen to about 130 deg. F.

Fig. 2.—The Mason Hay-drying plant, seen from the other side.

The air, which enters at the finishing end over the top of the crop, passes down through the latter, then along underneath it and past the central floating door; it then rises through the crop at the entering end and in a saturated state escapes through the vertical stack. On leaving the tunnel the dried crop is fed by a cross conveyor into a chaffing machine. After this it may either be bagged or baled (with a 15-h.p. motor) as it is, or alternatively, if the crop is lucerne, it can be reduced to a powder in a disintegrating machine. The latter requires a 40-h.p. motor to drive it, including the operation of a fan to blow the finished product through a delivery pipe. In the case of the Plainsboro' plant there are two such pipes; one leads to a barn, equipped with storage bins with a capacity of 200 tons, and the other to a cyclone double sack-filler. These pipes are made of light galvanised sheet-steel tubes and are ingeniously suspended on a steel rope, fig. 3. In this way, it is claimed, a crop growing in the field may be converted into hay and baled ready for transporting in forty minutes, the whole operation being carried out without handling by a single individual.

Fig. 3.—Delivery end, showing the chaffing machine on the right.

The plant will cure 20 tons of hay and bale it in 10 hours (two tons per hour), and the labour required is one man for mowing, three men and lorries for hauling, and four men at the plant. The amount of coal used in the heaters is about 8½ tons per day. By the process, seven men working on 600 acres for 165 days of the year can deal with over £12,000 worth of products.

The cost of the plant, including all machinery, tractors, electric motors and storage plant would seem very high to the ordinary farmer, as it is about £4,500. However, it must be borne in mind that it deals with the crop from 600 acres of land. The annual cost of operating is about £4,200; this includes fuel, allowance for rent of ground taken up by the plant, and the wages of each workman at £4 per week. Hence a product worth £12,000 is created by an installation costing £4,500. The possibilities of improving the farm load with such plants may be gauged by the fact that it is necessary to use 90-h.p. for ten hours per day for about six months of the year when working on lucerne alone. In the Chicago district a month's work can be found before May 15th on winter rye, and after October 15th a month's work on peas. Thus it is not difficult to visualise what such a load would mean in rural areas. No longer would central-station engineers see such difficulties in the way of providing distribution lines for the farmer. The makers are prepared to erect the plant at their own cost on the basis of a royalty on the output. They will also provide plants for groups of farmers who are prepared to contract to supply the necessary tonnage of green stuff.

The author has seen excellent samples of the product of this plant and has sampled the powdered form of lucerne which has been suggested as suitable for human consumption; when cooked it looks like spinach. Of course this material has been successfully used for a long while for chick-feeding at times of the year when it is impracticable to obtain green vegetables or other stuffs rich in vitamines. The author is also assured by Mr. Mason that the hay has passed the highest court of reference: the cattle never hesitate between the so-called natural and the artificial, and always ignore the former if the latter is available.

Mr. Mason is confident that the adoption of similar

methods in England would result in a revolution of the agricultural industry; he states that our moist climate, which is now a liability, can be turned into a great national asset; we should devote our land to forage crops, cut them at the milk stage and then artificially dry them. This would result in the grain crop yielding three times as much animal food as it does now, at least two crops per year, and the culture of lucerne becoming possible, giving 6,000 lb. per acre per year of dry material containing at least 18 to 20 per cent. of protein, as against 14 per cent. (or less if exposed to rain) of sun-made lucerne.

The arguments that are employed in favour of other methods of artificial crop drying apply also to this method. The process can, of course, be carried on during wet weather, as long as the lorries can be run on the land. If chain-track vehicles are employed, there need never be any stoppage for weather conditions.

Here, then, is a new aid to agriculture: a process that enables the farm to operate more along the lines of the factory—and that seems to be the only salvation for the agricultural industry. It is certainly a matter of very great importance to this country and can easily be worked along somewhat similar lines to those adopted for sugar-beet factories. The capital required is infinitesimal when compared with that necessary for such factories; but the farmer has to be convinced, publicity is needed, and confidence has to be instilled. However, the engineer can render considerable assistance in this direction, so let us get on with the good work.

Some Reminiscences.

By a Quondam Apprentice.

TEMPERAMENTALLY thoughtful, and inured to grappling with ever new technical problems, the electrical engineer is apt to consider life a serious business; apart from an occasional smile at the mirth-provoking troubles of the ubiquitous salesman, and his funny stories, he finds little to laugh at. Nevertheless, to most of us, a retrospective glance of memory at the days of our probation reveals a picture of the lighthearted and irresponsible game of electrical engineering as it used to be played in those days.

My own vivid impressions of experiences gained in a small manufacturing shop, manned by equal numbers of workmen and apprentices, fill me now with wonder and amazement—wonder at the tremendous change that has taken place in designs and methods since then, and amazement that with such a state of things a works could ever have been made to pay. Never, surely, was so diverse and withal so irresponsible a company of boys gathered together in one small shop. Nicknames there were for every one, and the workmen were not exempt. One, the young father of a rapidly-growing family, Arthur —— by name, became known as "Arthur-any-more?"; whilst the pattern-maker was rather unkindly given the sobriquet of "Warpy"—a sly reference to the conveniently unseasoned quality of the wood used for his patterns.

"Mack," the shop foreman (of Scottish extraction), whose real name I—and most of the others, I fancy—have forgotten, was at times not immune from the prevailing spirit of folly. Once, requiring some buckets, he sent a boy for them. The lad returned with three.

"What have ye brought them old things again for?" he demanded. "They're leaky: I told the governor I wanted new ones weeks ago."

Taking the buckets from the boy, he upturned all three. "There, now, that's one; that's two; and that's three" (driving the point of a chisel through each in turn). "The governor'll nae doot be able to see the holes the noo."

Even the classes at the technical college were by some regarded as an entertainment—as when the only note made by one of the students was to the effect that Mr. Brown, the lecturer, had "wished everyone a happy new year." The said Mr. Brown, being a practical man, delighted in reliability, and would sometimes hyperbolically describe an armature of which he approved, as one that "might be struck with a sledge hammer without injury." This so impressed our apprentices that one day "Brown's test," as it was called, was wantonly applied to a small armature at the works! The fact that it failed to pass the test was, however, not reported.

The proprietor of the works was, on the whole, an easy-going man, though equipped with an amazing vocabulary which he reserved for special occasions. When in the works he invariably wore a favourite dilapidated straw hat. Always on entering the office he would change his hat or cap for that badge of authority—the ancient straw. There was a legend current to the effect that he had started the works with the assistance of a legacy which was conditional upon his wearing his benefactor's old hat at least once daily.

It was easier then than it is now for employers to impose fines for infringement of rules. One of his rules, that outworkers should make good half the cost of any tools inadvertently lost or left behind on outside contracts, had the curious, though not altogether inexplicable, effect of actually augmenting the shop's small tool equipment.

His right-hand man, and almost constant attendant, was the draughtsman, a quiet-looking individual with tired eyes. When the firm's prosperity had begun to wane, and our employer was becoming morose and irascible, he was giving the draughtsman instructions regarding a dynamo for which he had just obtained the order; and he explained that certain old parts which were in stock were to be used. "We must make a profit on this machine," he said. "Use all the odd parts you can find—build up the machine from the scrap heap, if possible."

"I never know what you call the scrap heap," said the draughtsman, meekly.

"Why, the whole b——y shop, of course," the boss replied. (I regret the adjective, but truth compels.)

At that time it had become the custom on a winter's morning for the workmen and apprentices to gather in a group around the smithy fire in the early morning to discuss the prospects of the local football team, political questions, and that perpetual, favourite, vital subject, the mistakes and failings of the boss. These proceedings usually terminated abruptly owing to the unwelcome arrival of the subject of discussion, whose approach was heralded by his dog, which always preceded him. When the dog died, an effective warning signal was arranged by opening wide the throttle of the electric lighting engine and overrunning the lamps by several volts. This invariably induced the chief, immediately on his arrival, to go first to the engine room and lower the lights.

Through it all, though, some of us did manage to get an initiation into electrical engineering; and perhaps the close contact with practical work, and the rubbing of shoulders with workmen, had their advantages, for which the modern system of engineering training offers no exact equivalent.

That old works was closed down long ago, and ultimately demolished. The picture house since erected on its site is no doubt a more profitable venture—at any rate, for its promoters—than any merely utilitarian concern, such as an electrical engineering works, could ever be. The apprentices who served their time there are now widely dispersed, some to positions of responsibility, some into other trades, and some in no position at all. Yet to all of them the remembrance of their early training must at times bring some amusement, tempered perhaps with a feeling of regret for their follies. Those halcyon days!

Bigger British Trade in Canada.

Some reasons why we are not doing it.

COMPLAINTS are frequently made by British manufacturers that the Canadian market is unsympathetic to British-made equipment, and that American influence dominates Canadian buying. We publish below two important articles dealing with the situation and we commend the observations of our contributors to the serious attention of British manufacturers and exporters.

The writer of the first article—an English engineer who has been resident in Canada for 10 years applying British engineering equipment to Canadian conditions—holds that basic misunderstandings of the Canadian outlook and requirements exist in the minds of many British manufacturers and that these misunderstandings and not any underwriters' regulations or prejudice for American manufactures are principally responsible for more British equipment not being used.

The author of the second article is a Canadian correspondent who has had lengthy practical electrical engineering experience both in this country and in Canada. He holds that great as is the influence of the Underwriters' Laboratories in handicapping the British manufacturer, it is not responsible for the whole, or even the greater part of America's electrical success in Canada. Yet British articles of workmanship superior to American and at least as safe are not being approved, and European products are in consequence not available. He shows that Canadian electrical men object, as do British manufacturers, to electrical goods for sale in Canada having "to be approved in a foreign country," and he refers to the steps that have been taken to formulate a Canadian Electrical Code as a step towards emancipation.

I.—Handicaps to British Business.

(Communicated.)

It is a common occurrence to read and hear complaints made by members of British manufacturing companies visiting Canada, who undertake to enter the Canadian market either by establishing branch assembling or manufacturing plants in Canada or by establishing representatives to solicit business on their behalf. The nature of the complaints is almost always the same, and is to the effect that Canadian policy and practice are completely under the influence of the United States, or the American underwriters—that British equipment is not wanted and that Canadians put forward requirements which are frequently designed to exclude British companies from supplying it—that the requirements are unnecessary and unreasonable—that standard British equipment will actually meet the case, &c.

In the vast majority of cases, these complaints are not justified, and a more careful study and investigation, undertaken with the definite object of securing a real understanding of the Canadian point of view, would show that the British company is probably at fault.

The statement that American example dominates Canadian practice will first be dealt with. It is admitted that there is a great similarity between the general electrical engineering policies and conventions of the two countries, but this is to be expected on economic grounds alone on account of the exact similarity between problems to be solved in each country; British problems are totally different, and require a correspondingly different treatment.

The fundamental nature of the differences is as follows:—

(1) In Canada principally, and the U.S. largely, electrical energy is generated from water power. It is transmitted relatively great distances by overhead lines to distribution centres, which are widely separated and spread out and consequently must serve much larger areas than would be the case in England. The distribution networks are still principally overhead, and even where the larger towns have begun to put in underground cables, the load density per square mile is far less than is the case under similar locations in England, despite the larger energy usage per person in Canada. This is because the towns in Canada have their populations and industries spread over wide spaces and not concentrated into small areas as is unavoidable in the older countries.

It is at once obvious that distribution systems built as in England would involve expenditures quite out of proportion to the revenue earned. This condition has made it an economic necessity to develop distribution apparatus and equipment of the simplest and least expensive nature without undue sacrifice of reliability and efficiency. These latter factors cannot be, and are not, however, given anything approaching the same weight as in England when distribution systems are laid out. This affects sub-station layout and equipment, the pole line hardware, transformers, protective devices, wire and wire insulation, all of which, as used in Canada, would be considered far below permissible standards in Great Britain. This is not a matter of copying American practice, however; it is the spur of economic necessity, which incidentally has for the same reasons produced similar solutions to the problems arising.

(2) Industrially, the economic differences have compelled correspondingly different courses. In Canada, for instance, electrical energy forms a much smaller proportion of total manufacturing costs than in England. Labour is the big item, and rates for skilled mechanics range from 75 cents (3s. 1d.) to $1.00 (4s. 2d.) per hour. Other grades of labour cost less, but are correspondingly more highly paid than in England. With this condition is also the condition that the same grade of mechanical skill is not available—or cannot economically be availed of—in Canada as in England. This applies particularly to the labour used for manufacturing, maintaining, and repairing electrical industrial equipment—motors, transformers, switchgear, &c.

A little consideration of this will immediately show that refinements of design and manufacture for producing the highest efficiencies (and power factors) are quite unattractive to the Canadian buyer if a less rugged machine results. Ease of repair is more important than superior test characteristics, overload capacity than a lower price, reliability under severe (and what in England might be considered unfair) conditions than a merely safe mechanical design. These very definite requirements have also nothing to do with copying American methods; they are dictated by forces just as compelling as are those that have produced typical British practice to-day.

To illustrate how this has worked, a few examples will be given:—

(*a*) *Wires and Cables.*—The Canadian and American standards in quality of copper, quality of insulation

(rubber), and degree of stranding, are much inferior to British standards. They are, however, adequate for the conditions for which they are intended.

(*b*) *Distribution Transformers.*—These are practically all of the pole mounting type, and are sold at prices below English manufacturers' figures, despite the higher Canadian labour costs. The designs of all makers are almost standardised, and every trimming that can be left off has been eliminated. The sizes used are principally 5 kVA, 7½ kVA, 10 kVA, and 25 kVA. It is actually usually cheaper for an owner to sell for scrap a burnt-out transformer, certainly up to 50 kVA, and even up to 100 kVA frequently, than to endeavour to repair it himself or send it to the manufacturer for re winding. Exactly the same condition applies in the States, although, of course, practice in the very large centres like New York, Chicago, &c., is quite different, due, of course, to the entirely different needs. Such centres do not exist in Canada yet.

(*c*) *Motors.*—The industrial needs of Canada have resulted in motors being manufactured and used, which are lower in efficiency and power factor than good English practice will tolerate. Their pulley shafts are larger and longer, their starting torques are greater with consequent greater overload capacity. The air gaps are longer, the stator slots are open (except in small sizes), and squirrel cage machines are used in the ratio of probably 20 for each slip-ring machine. The resultant Canadian and American machine does stand up to the much severer conditions without trouble than do most British motors in Canada, and to-day there are many users in Canada who, after having tried English motors for three or four years, have gone back to the Canadian and American motors at higher prices with poorer technical performances on account of the lack of general ruggedness of some English machines, and because of the difficulty of repair. The only way in which the British manufacturer can compete is to produce equipment just as well able to meet Canadian conditions as the Canadian and American manufactured articles do. Conditions cannot be changed; practice will improve in time, but the process is slow and only evolutionary.

(*d*) *Switchgear and Control Apparatus.*—This class of equipment, as developed in England, is, with very few exceptions, absolutely unsuited for Canadian use, and the Americans have developed motor control apparatus that is cheaper, better and simpler for industrial use than anything produced in England. The policy of switching squirrel cage motors across the line is developing in both the U.S. and Canada. Push button contactor type switches are available, which give proper protection and complete safety at much less than the cost of English manual auto-transformer starters. Even American push button type auto-transformer starters frequently cost less than English manual starters. It is admitted that the English apparatus is generally of a very high grade, but actually the writer is quite unable to see any economic justification for the large amount of copper, iron and oil commonly found in English starters.

English manufacturers of oil circuit breakers generally speaking, over-rate the interrupting capacities and offer such equipment with stated and guaranteed ratings far in excess of what have been proved the abilities of the switchgear in service in Canada. The explanation offered for this is that English systems are far more safely installed (all underground instead of overhead), very completely protected and more carefully watched than is possible in Canada. The result is that serious faults only very occasionally occur, so that the equipment is very occasionally—if at all—called upon to render the service that it is rated at or designed for. The failures that sometimes do happen when a really bad fault comes on are then ascribed to some very unusual and exceptional condition.

In Canada, this is not the case and most circuit breakers and allied apparatus are called on fairly frequently to meet their full duty, as overhead lines frequently fall and short circuits are common on nearly all systems.

Four of the principal lines of electrical apparatus have been enumerated; they constitute some of the major types of electrical apparatus which Great Britain is able to furnish competitively in Canada, and the reason that very large incursions into the Canadian market have not been made, is the very general failure of manufacturers to ascertain what are the requirements of Canada from an economic and industrial (*not* an ideal) point of view, and properly to realise their true significance in respect to actual equipment design.

The Canadian buyer is becoming disappointed with English equipment in many cases—nevertheless, apart from some American owned industries, there has been —and still is among many buyers—a distinct policy to buy British equipment in preference to American if the former is available.

Some British manufacturers do not take proper care to test thoroughly apparatus shipped to Canada.

The Chicago Underwriters are admittedly anti-British but they no longer exercise (and have not exercised for some years) any control over apparatus used. The various provinces have established their own respective inspecting and testing bureaux, which have official status and are independent of any American control. The writer, for years, has never had the least difficulty in obtaining approval of British equipment of a very wide range and of many manufacturers.

To sum up, the Canadian market is available for, and receptive to, British manufactured electrical equipment, and whilst competition with America is much keener than probably anywhere else in the world, due to the proximity of the United States manufacturers, nevertheless British exports to Canada can be very largely increased by a more careful study and appreciation of the actual requirements, and the adaptation of British manufactures thereto.

II.—The Influence of the Chicago Underwriters.

(By a Canadian Correspondent.)

CANADA'S proximity to the United States, with a population some twelve times as great as her own, is responsible for the fact that certain difficulties confront British manufacturers wishing to trade here which are not met with in other parts of the Empire.

One of these, which affects electrical manufacturers particularly, is the domination which the Underwriters' Laboratories of Chicago hold over the Canadian market.

This situation has been discussed several times within the past few months by various technical journals both in Canada and England but some further comment on it may not be amiss.

Figures have been quoted in connection with the discussion referred to, showing the enormous preponderance of Canada's imports of electrical goods from the United States as compared with those from Great Britain. It must not be supposed, however, that, great as may be the influence of the Underwriters' Laboratories in preventing the British manufacturer from selling his products in Canada, that body is responsible for the whole or, necessarily, even the greater part, of the discrepancy between the value of the U.S. and British electrical exports to Canada.

Generally it may be stated that the Underwriters' Laboratories' approval of electrical equipment covers only such materials, apparatus and devices as are in common use in ordinary installations, *e.g.*, wire, conduit, small porcelain insulators and tubes, lamp-holders, the smaller sizes of motors, electric heaters,

domestic electrical appliances and devices, including electric cooking-ranges, &c. Large motors and generators, transformers, switchgear &c., and even incandescent lamps do not come within the purview of the Laboratories. If the value of the latter imported into Canada from the United States be subtracted from the value of the total electrical imports the value of the remaining imports from that country would be appreciably less. This does not make the comparison between Great Britain and the United States, so far as electrical materials are concerned, any less alarming, but it does indicate that the actual influence of the Underwriters' Laboratories of Chicago is not quite so great as it would otherwise appear to be. Furthermore, it is not quite fair to imagine that the Laboratories deliberately plan to keep British, and other countries', manufactures out of Canada—they arrange their rules and specifications to suit United States conditions; Canada is a neighbouring country and of much less account so far as population is concerned, with a great deal of her property insured against fire with United States' companies. Naturally enough, therefore, the Underwriters' Laboratories' standards were made to apply in Canada, and Canadians, finding a ready-made set of rules—the National Electrical Code—and ready-made specifications of the Underwriters' Laboratories, available for their use, adopted them without question, as, in the main, they suited Canadian conditions quite well; moreover, due to American aggressiveness, and perhaps to laxity on the part of British manufacturers, the electrical apparatus, fittings, materials, &c., available to the Canadian buyer were preponderatingly of United States origin.

The present situation has, apparently, arisen gradually from the causes outlined above, probably without anyone definitely foreseeing what the result would be, but the electrical interests of the United States realising, in recent years, what a trump card they hold in regard to their activities in Canada, now play it to the best advantage. British electrical manufacturers have, somewhat tardily, begun to recognise what this situation means to them. Unless they are prepared to turn out products, for the Canadian market, which conform absolutely to the Underwriters' specifications their products will not be approved in Chicago, the Canadian Fire Underwriters' Association will not accept, at standard rates, risks on buildings in which they are installed and Canadians will be loath to use them, as they will not care to run the risk of having to pay higher premiums, or of losing their insurance in case of fire should they install some unapproved materials or apparatus without the knowledge of the insurance company.

It is not only the British manufacturer who feels aggrieved at the fact that electrical goods for sale in Canada need to be approved in a foreign country, but the most important Canadian electrical manufacturers and several organisations and individuals interested in electrical matters object most strongly to the situation which exists. It is owing to this attitude here that, some three years ago, the Canadian Engineering Standards Association took definite action in the matter of formulating a "Canadian Electrical Code" or book of rules and regulations covering electrical installation work as the first step towards emancipating Canada, as far as possible, from the double yoke of the National Electrical Code (of the United States) and the approval of the Underwriters' Laboratories of Chicago.

The Canadian Engineering Standards Association created a strong, representative Committee to deal with the proposed Code and later engaged the services of two men for several months to compile the "Canadian Electrical Code," also, Sub-Committees were formed in most of the provinces, and the first draft of the Code has been under consideration by both Main and Sub-Committees for some time, although, owing to some divergence of views the matter has been delayed considerably. It is believed, however, that there is at present renewed activity and that the first draft is now under review—largely in order to bring it more into line with the National Electrical Code which has just undergone its usual biennial revision. It should be remarked here that Canada and the United States must, inevitably, always have many standards in common and for that reason it is not, in numerous instances, feasible for the latter to depart very far from the rules and regulations and standards adopted by the former.

The next step in the plans of the Canadian Engineering Standards Association is believed to be the preparation of specifications for electrical material, apparatus and devices on lines similar to those adopted by the Hydro-Electric Power Commission and the Underwriters' Laboratories, and when this work is completed there is little doubt that it will result in the establishment of a Canadian Laboratory where approval of electrical goods can be obtained.

Many readers of the Review will have learnt from its columns that Ontario already has its own rules and regulations, its own specifications, and its own electrical testing laboratories, and that approval can be obtained, for Ontario, independently of the Underwriters' Laboratories. The influence of the United States on the situation in Ontario is, however, very strong since the market provided by this one province is, relatively, so small. If the conditions in Ontario were extended to cover the whole Dominion, as the Canadian Engineering Standards Association so much desires, matters would be greatly improved, and the way of the British manufacturer would be less hard.

The "Underwriters' Laboratories of Chicago, Incorporated," an organisation created in 1901, has grown greatly during the intervening years. According to a recent article in the *Electragist* by Mr. Dana Pierce, the president, its technical work is conducted by the following departments:—Protection, Hydraulic, Electrical, Gases and Oils, Chemicals, Casualty and Burglary Protection. A list of the extremely numerous classes of materials, apparatus and equipment tested would be a very long one. Mr. Pierce states that "for the laboratories' purpose a standard is limited to items affecting safety and good practice as regards fire hazards and accident hazards." This, however, is not in all cases strictly true, as it is known that there are instances in which the specifications contain clauses which cannot strictly be held to affect either safety or good practice—this is no hardship to the American manufacturer who has already designed his product and arranged his tools, &c., so that the underwriters' specification will be complied with, but it has the effect of keeping out of the United States market and also, at present, out of the greater part of the Canadian market, perfectly good and safe electrical goods of foreign manufacture which, except for such entirely unnecessary and irksome restrictions, would undoubtedly receive the Underwriters' Laboratories' approval. As a matter of fact, the result of this situation is that many articles, of superior workmanship, at least as safe, and of much better appearance than those of American manufacture, which are readily obtainable in Europe, are not available over here.

"Underwriters' Laboratories of Canada" was formed in 1920 under a Dominion Government charter, and although no actual laboratory is in existence yet, there are rumours that it is intended to establish one before very long, and if this is done, it will make the United States influence in Canada all the stronger and still more difficult to counteract than under existing conditions.

The Underwriters' Laboratories are not the only factor at work in Canada tending to draw this country more and more closely to the United States in matters electrical. The Western Association of Electrical Inspectors has recently changed its name to "International Association of Electrical Inspectors (Western Section)," and now operates internationally in the two countries. The Association of Electragists (International) is similarly constituted. The American Institute of Electrical Engineers has branches in various

parts of Canada, some of them (*e.g.*, that in Toronto) are very active and doing useful work, while the I.E.E. still remains unknown. The *Electrical World* and other U.S.A. technical electrical journals have a great influence in keeping United States' electrical manufacturers and their products and all developments in electrical matters prominently before those interested in such matters, and even the Canadian papers must to a considerable extent follow suit on account of the great similarity between Canadian and United States practice, while British manufacturers, British products, and the British electrical Press are of relatively little importance.

With such numerous and powerful influences at work, the British manufacturer has indeed a hard task before him if he wishes to make headway, but several firms have done it through determination, hard work, and perseverance, so doubtless it can be done by others, through co-operation, especially, rather than by independent action. Last year some aggressive spade work was done in Canada by one British firm which may have far-reaching results; this, combined with the very useful and highly commendable work of the Canadian Engineering Standards Association, as outlined above, will undoubtedly tend to minimise the overwhelming domination of United States influences if properly followed up, though it would seem that this domination will be large for many years to come.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The Trade Union Bill.

The text of the Government's Trade Disputes and Trade Unions Bill was published this week. The main points are as follows:—Strikes with objects outside a trade dispute or directed against the community are declared illegal and punishable. Members of unions refusing to take part in such strikes cannot be expelled. Picketing and intimidation are defined and penalties are prescribed. The political levy is subject to a member's consent and not his refusal as at present. Civil servants are prohibited from joining "outside" trade unions or becoming affiliated to "outside" associations of trade unions. Local authorities are prohibited from making membership of a trade union a condition of employment. The Attorney-General is empowered to apply for an injunction to restrain unions from using their funds in contravention of the provisions of the Bill. The Bill does not apply to Northern Ireland.

The E.D.A.-E.L.M.A. Campaign.

During the last few weeks the organisers have been overwhelmed with ballot papers. The accompanying illustration

The Ballot—A Last-minute Rush.

shows a portion only of one day's haul. On the day in question—March 31st—over 30,000 papers were received.

Irish Free State Electrical Imports.

The imports of electrical goods, excluding machinery, into the Irish Free State during February last, were valued at £31,439, as compared with £38,715 in February, 1926. The imports during the first two months of the present year are returned at £72,373, as against £91,122 in the corresponding period of last year.

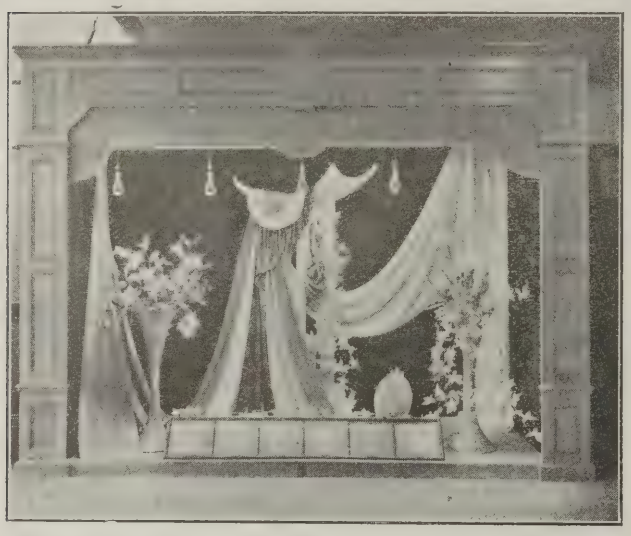
Church Lighting.

The accompanying illustration is a night view of St. John's Church, Great Clacton, which has recently been equipped with electric lighting. To obtain the successful result the fittings are concealed at the bases of the windows in such a way that the light radiates from the windows, giving a daylight effect; the wiring and fittings cannot be seen. There are six win-

St. John's Church, Great Clacton.

dows and the lamps (60-W gasfilled) are installed in groups of four in silvered glass reflectors. The chancel is lighted by six silvered glass reflectors with 100-W gasfilled lamps. The Callender wiring system was employed, and the installation was designed and carried out by Mr. F. Allum (Clacton manager for Mr. Arthur Cozens).

The Free State Radio Apparatus Duty.



In a statement to the Minister of Finance, Mr. James Kitchen, secretary of the recently-formed Irish Free State Joint Wireless Committee, says that in January, 1926, before the imposition of the duty upon imported radio apparatus, the value of imports of such goods was £22,099; in January, 1927, the value was only £3,387. The increase in prices due to the duty is said to be restricting the growth of broadcasting. The potential market is not big enough for the establishment of a home radio manufacturing industry, and therefore a protective tax is not needed. It is considered that the increased revenue from licence fees which would follow the abolition of the duty would more than compensate the Government for loss of revenue. The duty has been the cause of the closing down of a number of wireless retailers' businesses, it is stated.

"Magnet" Industrial Cooking Equipment.

The General Electric Co., Ltd., informs us that important establishments in different parts of the country have been equipped with "Magnet" industrial cooking equipment. Among them are Messrs. Bryant & May's factory at Bow; Messrs. Gestetner's factory at Tottenham Hale; Marylebone Station (G.C.R.); Maison Lyons (Oxford Street); the Regent Street Polytechnic; the Royal Academy of Music; Unity House (National Association of Railwaymen); Bucks. County Mental Hospital, Aylesbury; the Birmingham Infirmary; Messrs. W. D. & H. O. Wills's factory, Bristol; the Belfast Municipal College; and the County Borough Municipal College, West Ham.

Model Shop-Window Lighting.

The nicely-arranged shop window seen in the accompanying illustration formed part of a display arranged by the London Lighting Service Bureau at the recent Drapers' Exhibition at the Agricultural Hall, Islington. The window was a full-sized one. At first glance there seems to be something wrong; those naked lamps are not in accordance with the best practice. This, however, was part of the scheme—the horrible example which was first demonstrated before staging the

A Shop-Window Lighting Demonstration.

correct methods. Copious lighting equipment operated by a sign-type flasher was installed, bringing into play various combinations. Apart from the use of glaring lights, the window showed the effects of complementary banks of colour, and the application of floodlighting and spotlighting. During the exhibition brief lectures were given by members of the Bureau's staff.

Social Events.

On March 11th the staff of the Wiring Supplies Department of the British Thomson-Houston Co., Ltd., held a dinner at the Union Helvetia Club, W.1, the main object of which was to welcome the manager of the department, Mr. J. N. Stephens, on his return after a long illness. The dinner was attended by a large gathering of the staff, and among those present were Mr. R. A. Lower, the assistant manager, and other leading members of the department. The chair was taken by Mr. W. Millner, B.Sc., of the lighting engineers' section, who made a brief speech of welcome. Mr. Stephens, in his reply, expressed his pleasure in being present, and hoped that, in future, a staff dinner would be arranged annually. After dinner there was a concert, contributed to by members of the staff, and a dance.

A Siemens social and dance was held at Slater's, Leadenhall Street, E.C., on April 1st. About 200 people attended, and music for the dancing and community singing was provided by the Bohemians' Dance Band. Messrs. C. Hughes and W. G. Izant acted as M.C.'s.

New Australian Company.

Airzone, Ltd., has recently been formed in Sydney, N.S.W., with a capital of £10,000 to acquire an existing business of radio, electrical and mechanical engineers.

Australian Duty on Valves Deferred.

According to the *Board of Trade Journal*, the Commonwealth Government has further postponed the date of operation of the increased import duties on valves for wireless telegraphy and telephony until July 1st.

Catalogues for Honduras.

Commerce Reports states that the Honduras Government has decided to inaugurate a general information bureau for the benefit of both merchants and agriculturalists in Honduras. It is proposed to maintain a complete file of catalogues of products from different countries, and at present catalogues of electrical products are desired. They should be forwarded to Señor Ingeniero don M. R. Moncada, Ministro de Fomento, Obras Publicas, Agricultura y Trabajo, Oficina de Informacion, Tegucigalpa, Honduras.

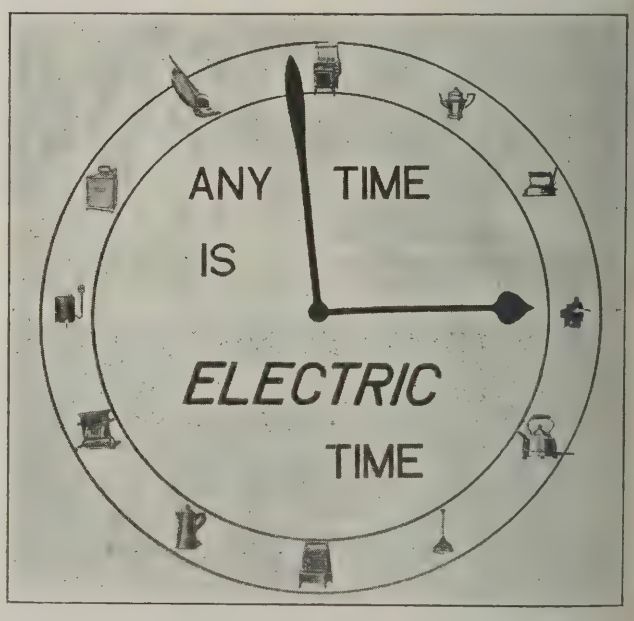
The Luxemburg Concession.

According to the Luxemburg correspondent of a Frankfort newspaper, as the Rhenish-Westphalian Electricity Works Company has given up its idea of competing for the concession for the electrification of Luxemburg, there only remain two offers before the country, those of the Belgian Centrales Electriques des Flandres and the Armstrong, Whitworth Co. The Council of State is said to have expressed itself against the English offer on the ground of the suggested gas concession, the gold currency tariff, the State guarantee for an annuity of over 22,000,000 fr., the lack of a coal and blast furnace basis, the use of English materials, &c. On the other hand preference is stated to be given to a scheme for co-operation between the Belgian company with the Luxemburg iron and steel industry. The project, it is added, will shortly be laid before the Legislative Chamber.

New Italian Company.

A company has lately been formed in Milan with the title La Compania Internazionale per Impianti Elettrolitica to acquire and exploit the patents of the International Electrolytic Patents Co., Ltd., in Italy, Austria, Bulgaria, Czecho-Slovakia, Greece, Jugo-Slavia, and Hungary. It is stated that contracts for a number of installations for the electrolytic production of hydrogen and oxygen have already been obtained.

A French-Belgian-Polish Undertaking.



A company is being formed in Brussels with the title Le Trust Métallurgique Belge-Francais, to amalgamate the principal electric power and tramway undertakings in Poland, including the following: Le Centrale Electrique du Bassin de Dombrowa; la Centrale Electrique du Bassin de Cracovie; les Chemins de fer Electriques Suburbains; and les Chemins de fer Electriques du Bassin de Dombrowa.

The G.E.C. at a Co-operative Exhibition.

The Prince of Wales spent some time during his visit to the Co-operative Exhibition in the old Royal Dockyard at Woolwich in inquiries as to the electrical features installed in the model bungalow by the General Electric Co., Ltd. In the entrance hall a "Magnet" electric fire had been installed, but the Prince's greatest interest was in the kitchen, where he closely examined the "Electric Wizard" which was on view. The Prince plied the attendants with questions as to the details of these electrical appliances, and expressed satisfaction as to their utility.

The "All-Electric" Day.

The photograph shows one of the many arrangements adopted by the Blackburn electrical engineer (Mr. P. P. Wheel-

"Every Hour has its Electrical Appliance."

wright) for the purpose of popularising the showrooms in Darwen Street. The huge clock moves and the hours are indicated by appropriate electrical apparatus.

A French View of the South African Market.

The French Commercial Attaché in the Union of South Africa calls attention to the large consumption of all kinds of electric household appliances in South Africa. Demand, he says, is increasing daily and is at present met principally by Germany and the United States. All the big ironmongers sell these goods retail; they do not order them direct but from the import houses where ample stocks are kept. These houses are usually the exclusive agencies of a European or American factory and either work on a consignment basis or actually buy the goods. The best method of gaining a footing on the market is to have a capable and reliable agent in whose hands a small stock should be placed on consignment.

Irish Contractors and the Government Electricity Bill.

We have already made reference to the Bill which the Irish Free State Government has drawn up, giving it the control of practically the whole of the electricity supply business in the Free State. Last week the Irish Section of the Electrical Contractors' Association issued a temperately-worded manifesto urging the Dail (the equivalent of our House of Commons) to support amendments which it was proposing to Sections 47 and 48 of the Bill which empower the State or local authorities to maintain showrooms and sell installations, fittings, and apparatus. The contractors point to the valuable work which they have already done in the interests of the industry and claim that the best results will be obtained if they are allowed to proceed unhampered by State or municipal competition. They point out that in the parallel case of the British Electricity (Supply) Act a clause agreed between the various interests was inserted; their amendments aim at the same idea.

For Sale.

Ilford Corporation Electricity Department has for disposal one 1,000-kW d.c. generating set. Prestwich County Mental Asylum invites offers for one 75-h.p. motor-generator for battery charging, one 460-V balancer, one mains booster, and one 300-kW Browett-Lindley steam balancer, coupled to 260-V generator. (See our advertisement pages to-day.)

Trade Announcements.

Mr. P. Gardiner, late of Edison Accumulators, Ltd., has become sales manager to Messrs. A. F. A. Accumulators, Ltd., who have been appointed sole concessionaires in British territory of the D.E.A.C. nickel steel alkaline accumulators.

Mr. A. B. Godden, radio engineer and manufacturer, of Canterbury, has removed his business from 31, Wincheap, to 3, Oaten Hill.

Messrs. Allen, electrical engineers, of Watford, have opened showroom premises at 40, High Street, Bushey.

Mr. Lionel Robinson terminated his agreement with Messrs. Henry Wiggin & Co., Ltd., as London manager on March 31st. He is now acting as London consultant for them, and will continue his business at 3, Staple Inn, W.C., from which address he will factor all their nickel and nickel alloy products. Stocks will be carried.

Messrs. Arthur Lyon & Co., 82, Fenchurch Street, E.C.3, inform us that they have been appointed sole distributors of the synchronised electric clocks made by Messrs. Gillett and Johnston, Croydon. The department is under the supervision of Mr. A. A. Lyon, late managing director of Arthur Lyon & Wrench, Ltd.

Mr. Frank Knight, electrical engineer, 16 & 18, Rose Street, Wokingham, has opened new showroom premises.

The Normand Electrical Co., Ltd., 3, North Side, Clapham Common, S.W.4, has decided to open its Clapham works to public inspection on Wednesday afternoons.

New Catalogues and Lists.

Brookhirst Switchgear, Ltd., Northgate Works, Chester. —Folder 194, dealing with the "Brookhirst Junior" solenoid starting panel.

Messrs. Crompton & Co., Ltd., Chelmsford.—List No. 81, containing brief notes and illustrations of the various types of generating plant manufactured by the company.

Wagner Electric Supples, Ltd., 66, Victoria Street, S.W.1. —Stock List No. 22E, containing particulars and prices of fractional h.p. and other motors, starters, &c. Also a pamphlet giving notes on single-phase repulsion motors.

Pope's Electric Lamp Co., Ltd., 5, Arthur Street, New Oxford Street, W.C.2.—April calendar-blotter advertising "Elasta" lamps.

The D.P. Battery Co., Ltd., Bakewell, Derbyshire.—A coloured wall sheet advertising "D.P." wireless and portable accumulator batteries.

Messrs. Mavor & Coulson, Ltd., 47, Broad Street, Mile End, Glasgow.—April calendar-blotter advertising the company's underground conveying equipment.

Messrs. Belbin & Bowden, Ltd., 3, Finsbury Square, E.C.2.—A series of priced and illustrated pamphlets dealing with lamps, radio valves, irons, kettles, and fires.

Hopkinson Induction Motors, Willesden Lane, North Acton, W.3.—April stock list of single- and three-phase motors

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—Catalogue Section H (3) containing fully-illustrated particulars of industrial and commercial electric cooking equipment for hotels, restaurants, bakeries, &c.

Messrs. Mawdsley's, Ltd., Dursley, Gloucestershire.—Two illustrated catalogues containing particulars and prices of the many types of motors and generators made by the company.

Bankruptcy Proceedings.

A. J. Garrod, Whitehorse Place, Wellingborough, manufacturer of radio sets and components.—The first meeting of creditors was held recently at the Official Receiver's offices, Northampton. The statement of affairs showed gross liabilities of £3,219, of which £2,947 was expected to rank, against assets estimated to produce £467, leaving a deficiency of £2,480. Debtor attributed his failure to the calling in of borrowed capital when his wireless experiments were in a critical stage and not quite perfect. It was decided that Mr. P. R. E. Smith should be appointed to act as trustee with a committee of inspection.

L. Wintle, electrical engineer, 27, Stafford Street, Market Drayton.—Receiving order made March 24th, on a creditor's petition. First meeting, held April 5th, at the Official Receiver's offices, 12, Lonsdale Street, Stoke-on-Trent. Public examination, April 28th, at the Court House, Crewe.

G. C. Barnes (Regent Electrical Works), electrical engineer, 3, Swift Street, Barnsley.—First and final dividend of 2s. 0½d. in the £, payable at the Official Receiver's office, 21, King Street, Wakefield.

H. A. Sanders, electrical contractor, The Black Cat Restaurant, Chawston, St. Neots.—Last day for proofs for dividend, April 28th. Trustee, Mr. H. Ball, Duke Street, Bedford.

J. R. Martin, electrical engineer, 11, Middlesbrough Road, South Bank, York.—Receiving order made March 29th, on debtor's own petition.

M. C. Jones (M. C. Jones & Co.), stockists of wireless parts and accessories, 239, Westgate Road, and 65, Thornton Street, Newcastle-on-Tyne.—Trustee, Mr. W. Brittain, Pearl Buildings, Northumberland Street, Newcastle-on-Tyne, released September 24th.

A. Stock, electrical and radio engineer, 323, Chapel Street, Salford.—First meeting, April 12th, at the Official Receiver's offices, Byrom Street, Manchester. Public examination, May 12th, at the Court House, Salford.

F. H. Armitage, electrical engineer, 9, Occupation Lane, Pudsey.—Trustee, Mr. J. O. Morris, Official Receiver, 12, Duke Street, Bradford, released March 25th.

Company Liquidations.

Claremont, Johnson & Co., Ltd., electrical and wireless factors, 4, Union Place, Wells Street, Oxford Street, W.1. The following are the principal creditors herein:—

	£		£
Armorduct Cable Co., Ltd.	233	Finston Mfg. Co. ...	82
Berry's Electric, Ltd. ...	61	Ludenscheider Install Werke	74
Belling & Co.	64	Midland Electric Mfg. Co., Ltd.	82
Bernard & Co.	95	Magnesia-Werke Weissence	95
Credenda Conduits Co., Ltd.	168	National Electric Supplies	81
C.A.S.E.	91	Shrimpton & Sons ...	52
General Electric Co., Ltd.	133	Stella Conduits Co., Ltd.	103
Grothe & Sohne... ...	146	Southgates, Ltd. ...	137
Gottlieb, J. L.	75	Siemens-Schuckertwerke	88
Brownie Wireless Co. ...	79	Three Star Accumulator Co.	116
Krageloh & Co.	235		
London Commercial Electric Co.	146		
Lee, A., & Co.	68		

Autochrome Signs (1926), Ltd., 12, Gerrard Street, W.—A meeting of creditors was held on March 28th, at the Society of Incorporated Accountants, E.C. The chair was occupied by Mr. C. H. Temple, 5 and 6, King Street, E.C., the liquidator in the voluntary liquidation of the company. The chairman reported that the liabilities were £670, whilst the assets were estimated to realise between £250 and £300. A gentleman who had been associated with the company, and who had found money for it, had intimated that if the voluntary liquidation was confirmed he would find sufficient to enable the whole of the liabilities to be paid in full. A resolution was passed confirming the voluntary liquidation of the company, with Mr. Temple as liquidator.

H. Clough & Co. (Bacup), Ltd., Bacup, electrical engineers, &c.—A meeting of creditors was held last week, at the offices of Messrs. F. Hunter, Gregory & Lord, Bacup. Mr. H. Pickup, the liquidator, submitted a statement of affairs which disclosed liabilities of £9,592, and net assets of £619, leaving a deficiency so far as the creditors were concerned of £8,973. As regarded the shareholders there was a deficiency of £11,973. The company was registered in 1919, with a nominal capital of £3,000, all of which had been issued, and was fully paid up. The company had made losses almost from its inception. The creditors confirmed the appointment of the present liquidator. The following are creditors:—

	£		£
Greenwood & Co. ...	237	Mitchell & Co.	22
Bailey & Co.	360	Wright, A.	10
Hunter, Gregory & Lord	34	Irvin & Sellers, Ltd. ...	46
Bacup Corporation ...	20	Keizer, L., & Co., Ltd....	23

The Foolprufe Patent Accumulator Co., Ltd., Market Harborough.—The resolution to appoint Mr. G. T. Berry as liquidator has not been proceeded with, but the shareholders have appointed Mr. J. B. Bullivant, of 6, Friar Lane, Leicester, and Mr. G. T. Berry, 32, The Square, Market Harborough, as joint liquidators. The appointment of Mr. Bullivant followed the wish of the largest creditors expressed at a meeting on March 25th. A meeting of creditors will be held on April 11th. Creditors should send particulars of debts, &c., to one of the liquidators by April 20th.

F. J. Jones & Sons, Ltd., electrical engineers, Chester.—A meeting of creditors was held last week at Chester, when Mr. J. Dodd, the liquidator of the company, submitted a state-

ment of affairs which disclosed liabilities of £5,212. The net assets were £3,945, leaving a deficiency of £1,267. The company was registered in July, 1922, with a nominal capital of £5,000. Shares to the face value of £3,940 had been allotted, of which £3,839 were issued to the Jones family. The business was for many years carried on by the father of the present directors, and after his death by the executors. The company then took over the business, but no cash consideration was paid. During 1925 the turnover was in the neighbourhood of £14,000, and there was a net loss of £239. Down to the end of October last the sales exceeded £14,000, and there was a loss of more than £1,000. Debentures were issued in July, 1925, the consideration being the guarantee of the bank overdraft. A resolution was passed confirming the voluntary liquidation of the company, subject to Mr. F. Lloyd Williams, C.A., Liverpool, being appointed to act as joint liquidator with Mr. Dodd, whilst a committee was also appointed consisting of the representatives of Electric Lamp Factors, Ltd., Callender's Cable & Construction Co., Ltd., Hollingdrake & Sons, Ltd., Crossley Bros., Ltd., and the General Electric Co., Ltd. It was stated that there was reason to hope that the business would be sold on advantageous terms as a going concern. The principal creditors are:—

	£		£
Elec. Lamp Factors, Ltd.	865	Crossley Bros., Ltd. ...	355
Callender's Cable & Construction Co., Ltd. ...	590	General Electric Co., Ltd.	271
Hollingdrake & Sons, Ltd.	469	Lister & Co.	160
		Tudor & Co.	158

Re-Echo Radio Co., Ltd., late 109, Marsham Street, Horseferry Road, S.W.1, radio manufacturers.—A further dividend of 9d. in the £ has been declared, and it is stated that there is an option for three months to purchase the registered trade mark, name, &c., of the company, and should this mature, it will be possible to pay another small dividend.

Goswell Engineering Co., Ltd.—Winding up voluntarily. Liquidator, Mr. R. G. Pye, 6, Martin Lane, E.C. A meeting of creditors was held at 95-98, White Lion Street, N., on April 6th.

Marine & Mechanical Electric Welding Co., Ltd., and Marine & Mechanical Electric Welding Co. (Cardiff), Ltd.—Meetings of members are called for May 2nd, at 146, Bishopsgate, E.C., to hear an account of the winding up from the Liquidator, Mr. L. C. F. Robson.

Electrical Stores (Nottingham), Ltd.—A meeting of members is called for April 28th at the offices of Messrs. Leman, Hill & Hilton, 1, St. Peter's Church Walk, Nottingham, to hear an account of the winding up from the Liquidator, Mr. S. H. Hill.

Kingsway Radio, Ltd.—Winding up voluntarily. Liquidator, Mr. W. C. Todd, 3, Cannon Street, E.C. Meeting of creditors, April 12th, at the Institute of Chartered Accountants, Moorgate Place, E.C. Particulars of claims to the liquidator by May 2nd.

Private Arrangements.

F. F. C. King, wireless dealer, 1, Botley Road, 87, St. Aldate's, and 32, West Street, Oxford.—A meeting of creditors was held recently, when a statement of affairs was presented which showed ranking liabilities of £1,627, of which £1,277 was due to unsecured creditors and £350 to the bank, partly secured. Net assets were £1,221, leaving a deficiency of £406. The present position was attributed to lack of capital. The creditors passed a resolution confirming the deed of assignment already executed, and the trustee was authorised to carry on the business with a view to its sale as a going concern. The following are creditors:—

	£		£
Burndept Wireless Co. ...	110	Johnson & Co., R. J. ...	24
Cleartron Radio, Ltd. ...	20	Kingerlee, T. H., & Sons	23
Cooper, G. R., Ltd. ...	21	Metro-Vick Supplies, Ltd.	40
De la Mare	55	Richardson, W. B. ...	57
General Electric Co., Ltd.	20	Wratton, J.	110
Hayward, C., & Son ...	36	Ewers, C. (Exors.) ...	127
Houghton-Butcher, Ltd.	54	Stroud, P. W.	116
Hughes, A., & Co. ...	53	Langmore, G.	20

Dissolutions of Partnership.

Partridge & Wilson, electrical and radio engineers, 217a, Loughborough Road, Leicester.—Mr. C. A. F. Partridge and Mr. H. G. A. R. Wilson have dissolved partnership. Mr. Wilson will attend to debts and continue the business under the same style.

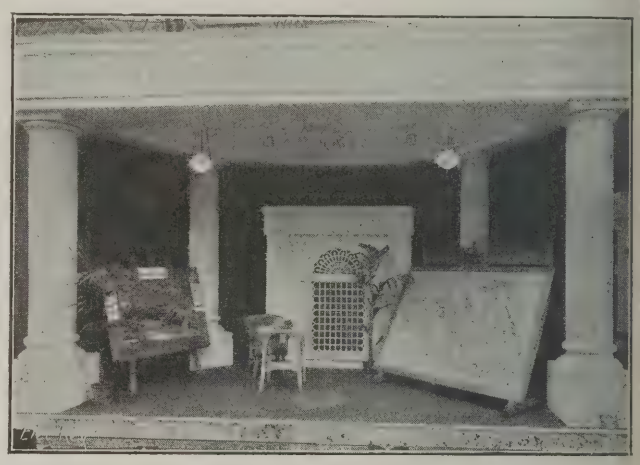
Pearn & Carson, electrical and mechanical engineers, Sherwell Lane, and 27, Tavistock Road, Plymouth.—Messrs. J. E. Pearn and A. S. Carson have dissolved partnership. Mr. Carson will attend to debts and continue the business.

York Radio Supplies, vendors of wireless supplies, Coffee Yard, York.—Messrs. S. M. Stevens and C. Shepherd have dissolved partnership.

Stone & Nicholls, electrical and radio engineers, 7, Locket Road, Wealdstone.—Mr. G. H. Stone and Mr. C. J. Nicholls have dissolved partnership. Mr. Stone will attend to debts and continue the business.

Holt & Co., wireless engineers, &c., 7, Garden Street, St. Annes-on-the-Sea.—Mr. S. I. Holt and Mr. G. W. Hammett have dissolved partnership.

Mutch & Farquharson, motor and electrical engineers, 367, King Street, and Seaforth Road, Aberdeen.—Mr. J. G. Mutch and Mr. C. V. J. Farquharson have dissolved partnership. Mr. Mutch will attend to debts and continue the business in his own name at the old address. Mr. Farquharson will carry on business in his own name at 36, Gordon Street, Aberdeen.



Philpot & Son, electrical engineers, 3, St. George Street, Canterbury.—Mr. D. McKellar and Mr. R. M. Pudney have dissolved partnership. Mr. D. McKellar will attend to debts and continue the business under the same style.

Frozen Time Switches Still Work.

Venner Time Switches, Ltd., has received from the cable ship *Lord Kelvin* photographs of a buoy bearing lamps controlled by "Venner" time switches. The lamps were frozen into a solid block of ice after the buoy had been at sea for five days in a heavy gale. The buoy was then brought aboard the ship after the top of the staff had been broken by the weight of ice. A letter states: "The steel sleeve which extended from above the cross trees to the top of the buoy prevented the lower part of the staff from breaking off, and thus saved the lamps intact, the clocks, &c., being in perfect condition, ticking away as usual."

The Shropshire Power Co. at the Fair.

In our notes on the British Industries Fair, Birmingham, we made mention of the very effective display arranged by the Shropshire, Worcestershire and Staffordshire Electric Power Co. The view reproduced herewith gives a better idea of the stand, which was only one phase of the company's tireless activities. With the photograph we received a little

The Shropshire Power Co.'s Stand at Birmingham.

booklet which the company is distributing. This is a consumer's *vade mecum*, telling him how to read a meter; how electricity is generated and distributed; how to obtain a supply; how to get premises wired; how to replace fuses and effect minor switch repairs; and what one unit of electricity will do. It is one of the best efforts of its kind that we have seen.

Major Segrave's Record.

Although a great deal regarding Major Segrave's speed record has appeared in the daily Press, we are compelled to refer to it, for the 1,000-h.p. "Sunbeam" in which the record was accomplished was fitted with B.T.-H. magnetos. We are also informed that the bearings of the car were made by the Ransome & Marles Bearing Co., Ltd.

Messrs. Vickers, Ltd., state that their steels were used in all the vital parts of the car.

Local Exhibitions.

Carmarthen.—A domestic electrical exhibition was held last week at St. David's Memorial Hall. The organisers were the Carmarthen Electric Supply Co., Ltd., and they secured the assistance of the staffs of local electrical contractors—Messrs. Chapman & Sons, A. H. Stoodley, and I. Davies. The opening ceremony was performed by the Mayor (Ald. W. Spurrell) and he was supported by the chairman (Mr. J. B. Arthur) and other officials of the Supply Co. Mr. Arthur, on behalf of the company, presented an ultra-violet ray apparatus to the County Infirmary, and was thanked by the Mayor. The exhibition was arranged in the form of rooms, each section being equipped in a thorough manner with the appropriate appliances. Cooking demonstrations were given in an adjoining hall. No fewer than 40 firms sent goods for exhibition. The company has an attractive tariff for domestic supply, namely, 1½d. per kWh all the year round.

Battersea.—Under the auspices of the Borough Electricity Department (engineer: Mr. F. A. Bond) an exhibition of electrical appliances was held recently at the Latchmere Baths. A comprehensive range of appliances was shown and demonstrations were given. As the department has a domestic flate rate of 1d. per kWh, as well as wiring and hiring schemes, electricity should be within the reach of everybody in the borough.

Calendars.

Just when we were waiting for it, the new wall calendar of the METROPOLITAN-VICKERS ELECTRICAL CO., LTD., came to hand from Trafford Park. The "Girl" series is continued, but there is a change in the type, and Miss Mona Maris, who acts for the British films, will inspire us and soften some of life's asperities until the end of March, 1928.

BROOKHIRST SWITCHGEAR, LTD., has sent us the April, May, and June cards for its 1927 calendar. These, similarly to their predecessors, bear excellent drawings of architectural features of ancient buildings.

Nottingham Contractors' Dinner.

Mr. H. J. Miles, president of the Electrical Contractors' Association, was the principal guest at a dinner of the Nottingham branch, at which Mr. Sidney Farr presided, on April 1st, and, responding to a toast proposed by Mr. H. Talbot, engineer of the Nottingham Corporation Electricity Department, to which Mr. A. D. Phillips, the manager of the Derbyshire and Notts. Electric Power Co., also spoke, he said their endeavour was to get a square deal not only for members of the organisation, but for everybody connected with the industry. He was sometimes asked why, as there were five or six thousand electrical contractors in the country, the Association had only 1,120 members. There were some electrical contractors whom the Association did not want; they claimed that their members were men who understood their work. Mr. Miles said that if all sections worked together harmoniously the Electricity (Supply) Act would lead to the advancement of the electrical industry. Mr. A. D. Phillips said that the success of the industry was dependent upon the capacity of the consumer. The consumer wanted his wiring done cheaply, but he should pay a fair price for what he got. The Association had gone a long way towards establishing principles of fair dealing. Ald. E. Huntsman, chairman of the Nottingham Electricity Committee and of the East Midlands Board, observed that his committee had determined that Nottingham should be supplied with electricity on the most advantageous terms that forethought, wise expenditure, and good management could secure. The committee aimed at getting electricity in all types of houses for all purposes, and desired very close co-operation with the contractors. A conference would have to be arranged to enable them to get together.

Electrical Imports of British Malaya.

The *Board of Trade Journal* reports that the imports of electrical goods and apparatus into British Malaya during 1926 were valued at £493,289, as against £386,492 in 1925—an increase of 27 per cent.

Book Notices.

A feature of the spring number of the M. & C. Apprentices' Magazine is a portrait and sketch of the career of Sir Duncan Watson, who is proudly claimed as an old M. & C. apprentice. An interesting section is that describing, and in many cases illustrating, suggestions for improvements in processes or equipment for which awards have been granted; in this issue some 50 awards are recorded, ranging from 5s. to three guineas, and nearly 150 suggestions are printed, whether adopted or not, the reasons for their rejection in many cases being given.

The first number of the *Kipling Journal* has been received from the hon. secretary of the Kipling Society, Mr. J. H. C. Brooking, The Milestone, Slough. It contains particulars of the origin and formation of the Society, many interesting reminiscences of Kipling's schooldays by his contemporaries, and a list of members.

"Business Simplified; the W.R.C.H. Plan Explained," by Barry W. Bruce. (18 pp.) Manchester: John Heywood, Ltd. Price, 1s. net.—The initials in the title of this pamphlet stand for "Wholesalers' and Retailers' Clearing House." This suggested organisation would deal with the accounts of businesses of all kinds. A retailer would only need to send a cheque covering the whole of his purchases, with a list of suppliers, and the clearing house would do the rest, saving the retailer money in the direction of cheques, postage, &c. The clearing house would also act as a comprehensive trade protection association, &c.

"Applied Magnetism," by T. F. Wall. Pp. 262; 146 figs. London: Ernest Benn, Ltd. Price, 28s. net.

Messrs. Petters, Ltd., have sent us a copy of an official guide to Yeovil (1s.), which has been written and illustrated by their publicity manager (Mr. A. T. Warbis). It is a production of great merit; the sketches of the features of Yeovil and district are particularly good.

German Turbine Syndicate.

A transaction which has just taken place in Germany has disclosed the fact that a syndicate exists for steam turbines in that country. The matter concerns the transfer to the Siemens-Schuckertwerke of the electrical and turbine branches of the Thyssen machinery works of Mulheim. As a result of the latter being in possession of raw material supplies it had been possible, it is said, for the concern to underbid the electrical firms in the prices of turbines by up to 20 per cent. The transfer of these branches to the Berlin firm will thus dispose of a competitor of the turbine syndicate and at the same time strengthen the position of the latter.

The Brush Co-partnership Scheme.

In connection with the co-partnership scheme which was established twelve months ago by the Brush Electrical Engineering Co., Ltd., shares to the value of £8,000 have been distributed among the employés. The average of allotment represents nine shares per employé. Each of the men engaged on weekly terms have received four £1 shares, which at present stand at 26s. 9d., the weekly staff six shares each, and the monthly staff 16 shares each.

The F.B.I. President's Address.

The annual general meeting of the Federation of British Industries was held on March 30th. In his address the retiring president, Sir Max Muspratt, Bt., said that the general strike from being a great catastrophe was converted into a great advertisement of British common sense and patriotism. During that strike and the coal dispute the F.B.I. gave invaluable assistance to its members to enable them to obtain coal from home stocks and overseas. The industry of this country showed unexpected vitality by the way in which it carried on; that could only be explained by the expansion of the home market in various directions. With regard to the future, there was room for optimism, for if so much of our industry could be maintained under last year's serious conditions, it was not unreasonable to expect that portion to continue and to expand. In addition, there was every sign that our export trade would reach a new normal not appreciably worse than our pre-war condition. Sir Max then dealt with the subject of international industrial conferences. The position had been summarised in the statement that the war had impoverished the Old World and enriched the New World, while it had reduced the purchasing power of the Old World and increased its productive power. It was necessary to make an effort to reorganise, to reduce costs, and to avoid excessive competition. By reason of its frequent meetings the Grand Council of the Federation had become a real clearing house of modern industrial thought. The industrialist must now not only understand his own industry, but must understand its relation to other industries, and be acquainted with all social and economic problems.

Recent Contracts.

The MIRRLEES-WATSON CO., LTD., Glasgow, has just received an important order for pumping machinery from the Indian State Railways for the Kalyan electric power station (consulting engineers: Messrs. Merz & McLellan). The contract includes three 27-in. and two 18-in. vertical-spindle type motor-driven centrifugal pumps, these supplying the condensing water required for the generating units; and nine pumps of smaller size for general service purposes. It also includes the water-screening plant of bracket type, the 42-in. circulating mains, and all pipework from the screens to the condenser and back to the river.

Marlborough House, St. James' Park, S.W., is at present being prepared for the occupation of the Prince of Wales. The extensive alterations include the complete re-wiring of the building, for which a contract has been placed by the Office of Works with MESSRS. H. J. CASH & CO., LTD., of Westminster. The steel conduits used throughout are being supplied by the "Perfecta" Seamless Steel Tube and Conduit Co. (1923), Ltd.

The HORSTMANN GEAR CO., LTD., Bath, has secured an order from the Engineering Department of the G.P.O. for 750 service boxes with time switches, and 250 service boxes without time switches, all for use in telephone kiosks. This is an interesting illustration of the growing adoption of automatic clock control for all types of public lighting.

American Radio Apparatus Licences.

The *Telegraph and Telephone Age* states that the Radio Corporation of America has entered into an agreement with the Zenith Radio Corporation, Chicago, one of the largest independent radio manufacturers, under which the Chicago concern is licensed to use the patents held by the Radio Corporation and also by the Westinghouse Electric and Manufacturing Company and the General Electric Company. The Zenith Corporation, the first of the independents to be so licensed, admitted, in the agreement, that the patents were basic and paid a large lump sum covering their use in the past. It is stated that negotiations are under way with several other independent concerns and that in all probability licences will be issued to those concerns. This movement is generally accepted as indicating that the Radio Corporation is soon to become the controlling factor in the radio industry in the United States. The agreement with the Zenith ends negotiations which have been under way since 1922, and also means the dropping of two civil actions against that concern. Numerous infringement suits brought by the Radio Corporation are pending, and if other independents are to be let in it probably will mean an early end of a great deal of litigation.

Price Reduction.

The MULLARD WIRELESS SERVICE CO., LTD., has reduced the price of its "D.U. 10" rectifying valve, which is used in connection with the "Drake" receiver described in No. 2 of "Radio for the Million."

Improved Tube Production.

At last week's meeting of Stewarts & Lloyds, Ltd., the chairman, Mr. A. C. Macdiarmid, said that the company's tube plants were being continuously improved and speeded up; the new mills were in operation and with full work they would be able to meet fair competition from any source. Special efforts were being made, with success, to open up new markets and develop existing ones. Mr. Macdiarmid also refered to the tube works which was being erected in South Africa by the company in co-operation with the United Steel Corporation (of South Africa), Ltd.

A Large Canadian Project.

M. Taschereau, the Premier of the Province of Quebec, has received a cable from the Agent-General for Quebec in London, Dr. Lemieux, stating that four members of a British syndicate, which has schemes in view for the industrial development of the Lake St. John region, involving ultimately a total capital expenditure of £100,000,000, are sailing shortly for Canada. Dr. Lemieux said that the members of the syndicate represent banking, railway, iron and steel, shipping and electrical supply companies.—*Reuter* (Quebec).

A Birthday Souvenir.

We have received from Venner Time Switches, Ltd., a handy blotter as a souvenir of the company's approaching 21st birthday. Its customers are eligible for similar souvenirs.

Prices of Raw Materials.

The following prices are only general, and they may vary according to quantities and other circumstances:—

CHEMICALS, &c.		Price April 5th.	Fortnight's inc. or dec.
a Acid, Oxalic	per lb.	5¾d.	...
a Ammoniac, Sal	per ton.	£60	...
a Ammonia, Muriate (large crystal)	,,	£52	...
a Bisulphide of Carbon	,,	...	...
a Borax	,,	£25	...
a Copper Sulphate	,,	£25 10s.	...
a Potash, Chlorate	per lb.	4d. to 4½d.	...
a ,, Perchlorate	,,	5½d.	...
a Shellac	per cwt.	£13 10s.	...
a Sulphur, Commercial	,,	£9 10s.	...
a ,, Roll	,,	£9 10s.	...
a Soda, Chlorate	per lb.	3½d to 3¾d.	...
a ,, Crystals	per ton.	£5 to £5 5s.	...
a Sodium Bichromate, casks ...	per lb.	4d.	...
METALS, &c.			
b Aluminium, Ingots...	per ton.	£107 to £112	...
b ,, Wire	per lb.	1/6 to 2/-	...
b ,, Sheet	,,	1/8 to 2/9	...
p Babbitt's Metal and Anti-friction Metal—			
Grade I	per ton net.	£272	£2 dec.
Grade II	,, ,,	£189	£1 dec.
Grade III...	,, ,,	£97	£1 dec.
Brass (rolled metal 2" to 12" basis)	per lb.	9⅜ 1.	¼d. dec.
c ,, Tubes (solid drawn) ...	,,	11¼d. to 11⅜d.	...
c ,, Wire, basis	,,	9⅜ 1.	...
c Copper Tubes (solid drawn) ...	,,	1/0½	...
c ,, Bars (best selected) ...	per ton.	£86	...
c ,, Sheet	,,	£86	...
c ,, Rod	,,	£86	...
d ,, (Electrolytic) Bars ...	,,	£63	2/6 dec.
d ,, ,, Sheets ...	,,	£143 10s.	...

Reporting on the lead position on April 2nd, Messrs. James Forster & Co. stated that a distinctly steadier tone had been in evidence. More activity had been shown by the Continent, Germany being reported as buyers. In this country a better demand was experienced, cable makers were buying fair quantities, while the home trade was fully occupied. Arrivals, on the other hand, in March were not excessive, totalling about 20,000 tons. "The stabilisation of the franc, which cannot now be long delayed, would at once stimulate French consumption, and at the same time relieve this market of its surplus lead."

The London Chamber of Commerce.

We have received from this organisation a copy of its report for 1926. The section devoted to the electrical and allied trades records the resignation of its chairman, Mr. S. A. Russell, through ill-health, and the appointment of Mr. P. M. Rossdale as his successor. Mr. A. M. Sillar continues to act as deputy-chairman. A committee appointed to consider the Electricity (Supply) Bill made a number of recommendations in support of amendments which, however, were not carried. The criticisms were that the Central Board was not under any effective control; that the developed areas would have to contribute to the cost of supplying undeveloped areas; and that the interconnection of stations and the construction of an efficient network could be secured by means which were less objectionable than those proposed in the Bill. The section welcomed the steps which had been taken by municipal supply authorities to reach an agreement with contractors upon the subject of municipal trading. The Merchandise Marks Bill also received the general approval of the section.

An Anglo-Italian Conference.

A conference was to take place yesterday and to-day between representatives of the Federation of British Industries and of the General Fascist Confederation of Italian Industries. The list of Italian delegates included On. Antonio Benni, president of the Confederation and of the S.A. Ercole Marelli and the S.A. Magneti Marelli; Gr. Uff. Avv. Rinaldo Panzarasa, president of the Società Idroelettrica Piemonte and the Società Telefoni Interprovinciali Piemonte e Lombardia; and Comm. Dott. Giorgio Pirelli, president of the Italian Chamber of Commerce in London and managing director of the Pirelli-General Cable Works, Ltd. The British representatives included Sir Max Muspratt, Bt.; Col. O. C. Armstrong, D.S.O. (Greenwood & Batley, Ltd.), Mr. D. A. Bremner (British Engineers' Association), and Mr. D. N. Dunlop and Col. R. K. Morcom (British Electrical and Allied Manufacturers' Association).

Lighting and Power Notes.

Birkenhead.—Supply to Wirral.—General contracts for overhead mains, transformers, sub-stations, kiosks, &c., in connection with the Corporation's electricity scheme to the Wirral Peninsula have been let. In about two months' time six or eight sub-stations will probably be erected in different parts of the area.

Brighton.—New Feeder.—At a recent meeting of the Lighting Committee the engineer reported that to deal with the increasing demand for supply in the south-west area of the borough, it would be necessary to lay a new 460-V feeder and make some slight modification to the existing feeder at present supplying that section of the area. The Committee authorised the work to be undertaken at a cost of £5,000.

Canada.—Electrical Development.—The Gatineau Power Company, subsidiary of the Canadian International Paper Company, has acquired two additional hydro-electric power installations in the Ottawa Valley. The first, near East Templeton, Que., is the Bonhomme electrical plant developing 600 h.p. The other is the plant at Papineauville, Que., of the Papineauville Electric Company, with a capacity of about 1,000 h.p. The purchase of these two power plants includes important water rights on the Blanche, Ottawa and Nation Rivers, and the Gatineau Power Company, which already controls the Chelsea, Farmers Rapids and Paugan Falls developments, on the Gatineau River, intends to carry out extensive works for the augmentation of the supply of electrical energy in the districts which may be served by the company.

Cannock.—Termination of Agreement.—The Urban District Council is to give Wolverhampton Corporation twelve months' notice to terminate the agreement under which the Corporation has had control of the commercial and distributing side of the Cannock electricity undertaking during its initial years. The Council's agreement with Wolverhampton for bulk supplies will continue.

Cardiff.—Loan Sanctioned.—The Corporation has received sanction to the borrowing of £110,000 for mains.

Chelmsford.—Supply to Marconi Station.—The Electric Supply Corporation, Ltd., is to give a supply of electricity to the Marconi experimental station, Broomfield Road.

Continental.—Spain.—The Spanish Consul in Gothenburg states that the utilisation of the waterfalls in Spain is one of the general reforms which are proceeding in that country. It is intended to harness about 1,500,000 h.p., and he states that Swedish firms will presumably be allowed to make proposals for the establishment of the works.

Sweden.—The Korsnaes Saagverksaktiebolag has bought from the Avesta ironworks its share in the Kraangedsforsen waterfalls on the Indal River in Lower Norrland, which will be able to develop about 200,000 h.p. when fully exploited.—*Reuter's Trade Service* (Stockholm).

Italy.—The Società Idroelettrica de l'Alto Timavo is engaged on the construction of an installation for the supply of electricity to the town of Trieste to the extent of 180 million kWh per year. Two hydro-electric stations are being established, one on the River Recca, which will comprise five 15,000-h.p. Pelton-type turbo-generators, and a smaller one one the River Padez, which will have three 1,000-h.p. sets.

Crookhill.—Institution Supply.—The West Riding County Council has arranged with the Doncaster Collieries Association, Ltd., for the supply of electricity to the Crookhill Hall receiving home on the following terms :—The Association to supply, erect and maintain the necessary line from the Association's Edlington Village sub-station to Crookhill Hall; also supply the necessary transformer for stepping down the pressure from 3,300 V to 110 V for lighting and power; the County Council to make a minimum annual payment of £80 for an annual consumption up to 9,600 kWh, but if the consumption exceeds this amount the payment to be at the rate of 2d. per kWh.

Darlington.—Electricity Supply.—The Rural District Council has consented to the application of the Town Council for a Special Order to supply electricity to houses in the garden suburb, outside the borough, but has reserved power for the Cleveland & Durham Co. to take over the supply if found convenient. Consent has also been given to the company for the erection of an overhead cable to supply electricity to Middleton St. George.

Eastbourne.—Opposition to Order.—The Corporation has lodged formal objection to the application of the Electric Supply Corporation, Ltd., for a Special Order authorising it to supply electricity in the parish of Hailsham, which is proposed to be included in the Eastbourne area.

Harwich.—Loan.—The Electricity Committee is to apply for sanction to the borrowing of £5,000 for the following purposes :—Services, £2,000; meters, £1,000; assisted wiring installations, £1,500; domestic apparatus, £500.

Lytham-St. Annes.—Loan.—Application is being made by the Town Council for sanction to a loan of £31,813 for electricity purposes.

Prestatyn.—Electricity Supply.—According to the *Manchester Guardian*, at a recent meeting of the Urban District Council it was reported that good progress was being made with the laying of the underground cables and the construction of the sub-station, and that the supply to the district would be available shortly after Easter.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts :—

Preston.—Lighting :—In the borough : From 8d. per kWh, less 10 per cent. discount, to 6½d. per kWh, less 5 per cent. discount. In the urban district of Fulwood : From 8d. per kWh, less 10 per cent., to 7d., less 5 per cent. Other districts : From 8d. with no discount, to 7d., less 5 per cent.

Southampton.—The increase of 20 per cent., made owing to the coal dispute, has been removed.

Bedford.—Lighting : Flat rate reduced to 6d. per kWh. The temporary increase of 10 per cent. withdrawn.

Winchester.—The temporary increase of 7½ per cent. has been removed.

Reigate.—Lighting : From 6½d. to 6d. per kWh. Power for commercial purposes : From 2d. to 1½d. per kWh.

Erith.—Domestic purposes other than lighting or power : From 2d. to 1d. per kWh. Power (except supplies given under power agreements) : From 3d. to 2d. per kWh.

Reigate.—Loan.—The Town Council is applying for sanction to a loan of £24,000 for the installation of new plant at the electricity works.

Rochdale.—Supply for Institution.—The Board of Guardians has decided to expend a sum of £3,500 on removing existing plant, and installing new plant to enable electricity from the Corporation's mains to be used at Birch Hill Institution.

Seaham Harbour.—Electricity Scheme.—The Urban District Council has accepted a revised tender of Messrs. Gray Bros. (Newcastle), Ltd., amounting to £15,468, in connection with the electricity scheme for the district, being an increase of £259, and application is to be made for the proposed loan to be revised accordingly.

Scarborough.—Revised Electricity Charges.—The Electricity Committee has recommended to the Town Council the adoption of a flat rate of 6½d. per kWh for electricity for lighting, with a discount of 5 per cent. for prompt payment of accounts. Flat rates of 1½d. per kWh for heating and cooking and 2½d. per kWh, less 5 per cent., for power are also proposed. There is a graded scale of special contract rates for power consumers who take between 10,000 and 100,000 kWh per annum.

Shrewsbury.—Inauguration of New Plant.—A new 600-h.p. Diesel engine, coupled to a 400-kW generator, was formally set in motion by the chairman of the Electricity Committee on March 28th. The cost of the extension was £15,000.

Taf Fechan.—Railway Station Supply.—At a recent meeting of the Water Board the Great Western Railway Co. inquired whether the Board would be in a position to give an electricity supply from its generating station for lighting Pontsticill station, the stationmaster's house and sidings at either end of the platform. The question as to whether a supply might be afforded to the village of Pontsticill was also raised. Consideration of the matter was deferred.

Uckfield.—Rescission of Order.—The Rural District has decided to request the Electricity Commissioners to rescind the powers granted to the Crowborough District Gas & Electricity Co. for the supply of electricity in Rotherfield and Mayfield, on the grounds that the company has taken no steps up to the present to give a supply, and in view of the company's supplying gas, the Council is of opinion that it has less inducement to supply electricity than the Weald Electricity Supply Co., Ltd. If the Commissioners are not prepared to rescind the powers at present, the Council proposes that if the company fails to give a supply in these areas within the next two years, the Commissioners should transfer the powers to the Weald Company.

Acquisition of Gas Stock.—The *Sussex Daily News* reports that the Electric Supply Corporation, Ltd., has acquired practically the whole gas stock of the Uckfield Gas & Electricity Co.

United States.—Electrical Development.—Work will be commenced shortly on a sub-station which the Public Service Electric & Gas Company has planned for the Marion generating station at Jersey City, N.J. According to the *Electrical World* it will cost approximately $3,000,000 and will be called the Hudson switching station. It will be the third of a new type of station to be built by the company, the others being at Trenton and Athenia, near Passaic. The Hudson station will distribute electricity generated at the Essex, Kearny and Marion stations so as to take care of the growing demands of Jersey City, Union City, Hoboken, Hackensack, Bayonne, Rutherford, Englewood, Edgewater, Leonia and other municipalities in Hudson and Bergen Counties. The portion of the station to be completed this year will represent a capacity of 126,000 kW. The ultimate capacity is designed to be 216,000 kW. The station will contain six 85-ton transformers furnished by the General Electric Company. The first part of the station is scheduled to go into operation by October 1st.

Work has commenced on the foundations of Debray No. 3 power station of the Detroit Edison Co., the initial installation of which will include two 50,000-kW turbo-generators. The plant will be put into commission in 1928, and the cost is estimated at $9,500,000. A sixth unit is also to be installed at the company's Trenton Channel station, which will raise the plant capacity to 300,000 kW. At the Marysville station a 30,000-kW set is to be installed which will increase the rating of the station to 110,000 kW. It is anticipated that the company will spend $32,000,000 on construction work during the current year.

Walsall.—Supply to Housing Estate.—Plans for mains to supply 666 houses to be erected by the Corporation on the Ide Road and Four Crosses housing sites have been approved, the estimated cost being £8,000.

Walton-on-Naze.—Electricity in Bulk.—The Electricity Committee has submitted a report to the Urban District Council regarding the conference with Clacton Town Council in connection with the proposed bulk supply of electricity to Walton. The Clacton borough electrical engineer proposes the erection of a sub-station near Frinton railway gates, the cost of laying the cable from the sub-station to Walton to be borne by the Urban Council, and the cost of the cable from Clacton to the sub-station to be borne by the Clacton Council, which has already applied for the necessary Order. It is anticipated that a bulk supply will be available within one year from the granting of the Order.

West Ham.—Loan.—The Town Council has applied for sanction to a loan of £83,280 for mains, services, transformers, feeders, sub-stations, and wiring installations.

Wirral. — Institution Supply. — Whether it would be cheaper for the Board of Guardians to generate its own electricity for the Clatterbridge Institution or to obtain a supply from the Birkenhead Corporation was considered at a recent meeting. Mr. Lloyd Barnes, consulting engineer, advised that it would not be a wise policy to take a supply from the Birkenhead Corporation at the present rates. If the Corporation offered electricity at 1.2d. per kWh the Guardians should accept. A Committee was appointed to meet the Birkenhead Corporation.

West-Midland Electricity District.—Inquiry.—A public inquiry was to be opened at Iron Bridge Police Station on Wednesday last relating to the proposed erection of a super-power station at Buildwas.

Wrexham.—Loan.—The Town Council has applied for sanction to a loan of £1,550 for a rotary-convertor, switchgear, &c., for the Grosvenor Road sub-station.

Wiring of Small Houses.—The electrical engineer is to submit proposals for the installation of electricity in small houses under an assisted wiring scheme.

Showrooms, &c.—A public exhibition of electrical appliances is to be held in September, and it is proposed to open a permanent showroom for the undertaking.

York.—New Boiler Plant.—The City Council has received sanction to the installation of two new boilers in place of certain existing boilers at Foss Islands generating station.

Tramway and Railway Notes.

Bradford.—Tramway Accounts.—A loss of about £10,000 on the year's working of the city tramway is attributed to the general strike. The loss on the tramway during the year has been largely compensated for by increased receipts on the railless-car services and the department's motor-'buses. The revised fares, outlined in our issue of March 25th, came into operation on April 4th.

Continental.—Poland.—Construction work on the first long-distance tramway, between Warsaw and Zyrardow, a distance of 30 miles, which was entrusted to the Power and Traction Finance Co., of London, has been completed. Services will begin when the rolling stock arrives from Great Britain.—*Reuter* (Warsaw).

Belgium.—The Compagnie Générale des Tramways d'Anvers has recently replaced the old rotary convertors at its transformer stations at Merxem and Hoboken by mercury rectifiers. A new transformer station is to be constructed in Antwerp.

Croydon.—Route Abandoned.—The Addiscombe route of the Corporation tramway was closed down on March 31st, and a motor-omnibus service introduced by the London General Omnibus Co. The company has agreed to employ a large number of the men affected by the change, and work is to be found for the remainder.

Dearne Valley.—Fares.—The Dearne Valley Light Railway Committee met recently to receive the report of a deputation which had interviewed Sir Henry Maybury, Director-General of the Roads Department, Ministry of Transport, on the question of protective fares for the Light Railway, over the route from Thurnscoe to Barnsley. According to the *Electric Railway and Tramway Journal*, this matter had been previously discussed with the Minister, but some doubt still remained whether the arrangement applied to the whole route or only that part of it in the areas of the four Councils who form the Light Railway authority. The Committee contended that the protective fares applied to the whole route, and emphasised this in its representations to the Minister. The Minister's ruling on the point is not yet known. It is understood that he is arranging a meeting with the other interested party, the Barnsley Traction Co.

Glasgow.—Tramway Improvements.—A scheme for the reorganisation and reconstruction of the rolling stock of the Corporation tramways has been approved by the Tramways Committee. It is proposed that tenders be invited for 50 new double-deck cars, and for the reconditioning of 150 of the present cars, the work to be carried out at the Department's workshops at Coplawhill. The estimated cost is £345,000. The proposals have been submitted to the Corporation for approval.

Heywood and Middleton.—Light Railways.—The Minister of Transport has recently made the Heywood and Middleton Light Railways Order, 1927, authorising the construction of light railways in the boroughs of Heywood and Middleton.

London.—"Tube" Telephones.—According to *The Times*, further safety devices are being installed on the Underground Railways in the form of telephonic means of communication between driver and guard, and experiments are now being made to ascertain whether the arrangement could be effectively employed to allow of the use of instruments in the carriages, so that announcements as to routes, non-stopping, &c., might be made by the guards to passengers throughout the train. The policy of the company is to reduce to a minimum all automatic or routine manual work, as such work is monotonous and often wasteful. The aim must be to supply the most efficient and fully-developed instrument to be handled by a limited but skilled staff. The change of system will occupy at least two or three years to carry out.

Tramway Station.—The Metropolitan Electric Tramways Co., Ltd., is to construct a tramway station in the forecourt of the Golder's Green Tube station on property belonging to the railway company, and a connection from the existing tramway in Regent's Park Road to connect up with the station at a cost of £1,870.

Tramway Reconstruction.—The Highways Committee of the L.C.C. has recommended the doubling of the tramway track in Old Street and Kingsland Road, at an estimated cost of £12,000.

Perth.—Proposed Abolition of Tramcars.—A Special Committee of the Town Council recently considered a report submitted by Mr. Pilcher recommending the substitution of motor-omnibuses for the present tramway system, and it was decided to meet Mr. Pilcher to discuss his report.

West Hartlepool.—Railless Cars.—Mr. J. H. Parker, Corporation electrical engineer and transport manager, in the course of a recent address to local Rotarians, stated that the town had the largest fleet of pneumatic-tired railless cars of any transport authority in the country. Tramcars had their merits as large-capacity moving platforms in densely-populated areas, but were doomed for passenger traffic outside those conditions. In answer to the criticisms as to the cost of the new service, he stated that the total cost of the new vehicles, the overhead equipment, taking up the tramway track, and the restoration of the roadway, would amount to less than half what it would have cost to relay the tramway track.

The new railless-car service between West Hartlepool and Seaton Carew was formally inaugurated on March 28th. With the conversion of this route, the Corporation's transport service has been completely changed over to railless cars.

Telegraph and Telephone Notes.

Aircraft Navigation.—New Wireless Station.—Among the developments now in hand for the reorganisation of the London air port at Croydon is the provision of a new wireless station, which is to be erected for the Air Ministry by Marconi's Wireless Telegraph Co., Ltd., to replace the one that has done duty there for the last seven years. The new station will consist of a group of four 3-kW transmitters operated in conjunction with a direction-finding receiver. The transmitters will be capable of telephony and continuous-wave and interrupted continuous-wave telegraphy transmission, the wave range being from 800 to 2,000 metres; independent drive circuits will be incorporated to maintain constancy of frequency and wave-length, and energy is to be supplied by a common motor-alternator group, the power from which may be switched on to any of the transmitters. The new direction-finding receiver has been specially designed to have selective characteristics and incorporates filtering and amplifying devices; it is arranged so that, if required, two or more circuits can be operated on different wave-lengths for the reception of telephony and telegraphy on the same aerials. In order to keep the neighbourhood of the aerodrome as free as possible from obstruction, the wireless masts and transmitters will be erected two or three miles from the air port and operated by the "remote-control" system.

"Beam" Radio-Telegraphy.—Australian Service Opened.—Amalgamated Wireless (Australasia), Ltd., announces that the radio-telegraph "beam" service between Australia and England will be opened to-day, April 8th. Messages will be accepted throughout Australia to all parts of Great Britain, Ireland, and the Continent of Europe, and messages from Great Britain, Ireland, and the Continent of Europe will be received for delivery to any address in Australia. Although cable rates between England and Australia have been reduced twice during the past twelve months, the rates of the "beam" wireless service will be lower than the existing cable rates and one-third less than the cable rates existing on January 1st, 1927. A second "beam" station is now being completed for the Amalgamated Wireless Company to give a direct service to and from Montreal. Over this route messages to and from all parts of Canada and the United States and South America will be sent and received, and it will also be available if required as an additional channel of communication with London.

Ecuador.—Telephone Reconstruction.—The Allmaenna Telefonaktiebolaget L. M. Ericsson has received an order from the Government of Ecuador for the complete reconstruction of the telephone system in Quito, the capital. The new system will be equipped to serve 2,000 subscribers to begin with.—*Reuter's Trade Service* (Stockholm).

The Telephone Service.—"Absent Subscribers'" Service.—What is known as the "absent subscribers' telephone service" was initiated, as an experiment, on April 1st by the Post Office. The City exchange was selected for testing the service, under which a subscriber, before going out and leaving his telephone unattended, may inform the exchange how long he will be out and where he may be found, for the benefit of persons ringing him. The fee is: For any period of interception not exceeding four hours, sixpence; exceeding four hours, one shilling. For every call intercepted a charge of a penny will be made. The minimum period for interception is half-an-hour, and the operator continues to intercept calls until the subscriber returns and notifies the switchboard.

Transatlantic Telephony.—London-Mexico Service.—The long-distance telephone line between Mexico City and San Luis Potosi, covering half the distance between the capital and the American border, is now open, and it is expected that the remaining half will be completed in September. By an agreement between the Telephone and Telegraph Companies of Mexico and America, the privileges of the transatlantic service to England will then be extended to Mexico.

Radio Notes.

France.—School Aerials.—On the ground that aerials might during a sudden storm fall to the ground and injure passers-by, the directors of Paris public schools have been requested to take down the aerials erected over their buildings, says the *Daily Mail*. The Paris municipal authorities justify their decision by arguing that the wireless sets installed in buildings used as public schools are not used by the directors for the purpose of teaching their pupils, but solely for their own personal amusement.

Japan. — New Stations.—A considerable extension of Japanese broadcasting is indicated by an order which has been placed with Marconi's Wireless Telegraph Co., Ltd., by the Japanese Broadcasting Association for three broadcasting transmitters. They are to be designed to deliver 10 kilowatts of aerial energy, and it is understood that one is to be located in the Japanese capital (Tokio), and another in Osaka, the largest city in Japan; the situation of the third station has not yet been indicated. Tokio will be the twelfth capital city of the world in which a Marconi broadcasting station has been installed.

It is reported that an order has also been placed with Standard Telephones and Cables, Limited, for the complete equipment of three broadcasting stations, their associated studios and the necessary machinery, for the Japanese Broadcasting Association. The stations will have three times the power of 2LO, which is of 3-kW capacity.

Licences.—Substantial Increase.—On the last day of February, 1927, the number of receiving licences issued by the Post Office had reached 2,234,988, an increase of 329,000 in a year; the total is exclusive of the 4,403 licences which have been granted free of charge to blind persons.

Loud-Speakers.—Sheffield By-Law.—The Watch Committee of the Sheffield City Council has recommended the making of a by-law to control the use of wireless loud-speakers which cause a nuisance by their "noise." A fine not exceeding £5 is the proposed penalty.

New High-Power Station.—Plant Installed.—Complete new transmitting apparatus has been instaled at the Daventry broadcasting station; it will have a power of 20 kW and operate on a wave-length between 300 and 400 metres. It will be the first true source of alternative programmes in this country, which, however, are not likely to become available until the autumn, for the test period will be a lengthy one. When the Postmaster-General formally sanctions the establishment of the first h.p. regional station, the new plant will be removed from Daventry to the location chosen for that purpose.

South Africa.—New Company.—As has already been briefly stated, an agreement has been signed between the Minister of Posts and Telegraphs and Mr. I. W. Schlesinger, of the African Theatres, Ltd., and African Films, Ltd., for the grant of the licence of the J B station to the African Broadcasting Co., which was formed by, and its capital underwritten by, Messrs. I. W. Schlesinger & Co., and listeners will be given preference in the allotment of shares. The Government has two directors and the Transvaal Radio League one. The company will control broadcasting in the Transvaal and Orange Free State. If the licences at Cape Town and Durban are at any time surrendered voluntarily they will be transferred upon application to the A. B. Co. Meanwhile the relaying of A. B. Co.'s programmes will be prohibited unless duly authorised. Within nine months the existing station will be transferred to Bloemfontein, and a licence will then be granted for transmission in the Free State, says *World Radio*, and a more powerful station will be erected in Johannesburg. The Transvaal and Orange Free State licences are to be granted for five years with the option of renewal for another five, the Government retaining the right to take the licence during the latter period. Out of the first profits shareholders will first receive a non-cumulative dividend of not more than 10 per cent. per annum; thereafter further profits will be distributed equally between shareholders and the Government, the latter using its share to reduce fees. To check piracy, the Minister has promised to ask Parliament to pass an Act compelling traders to examine their clients' licences before the latter can purchase wireless sets or parts.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the Electrical Review containing the advertisement is given in parentheses below.

Contracts Open.

Australia.—Melbourne.—May 10th. Postmaster-General's Department. Telephone relays. (B.X. 3333.)*
May 17th. Resistances and reactances. (B.X. 3307.)*
May 23rd. State Electricity Commission. Switchgear and accessories. (B.X. 3285.)*
May 9th. 6,600-V transformers and spares. (B.X. 3331.)*
July 5th. One 15,000-kW steam turbo-generator and accessories. (B.X. 3369.)*
Sydney. — May 9th. Electricity Department. Station auxiliary switchgear. (B.X. 3338.)*
April 26th. A.c. electricity meters. (B.X. 3407.)*

Barnes.—Electricity Department. 1,200 yd. l.p. armoured multiple cable. (April 1st.)

Barking.—May 9th. County of London Electric Supply Co., Ltd. Cables and accessories for the Barking power station. (April 1st.)

Belgium.—Brussels.—May 13th. Municipal Council. Two 6,000-kW steam turbo-generator sets and one 1,500-kW set, for the municipal power station. Particulars (Cahier des Charges), for 125 francs, from Hotel de Ville, Brussels.

Bolsover.—April 19th. Urban District Council. Cables, boxes, pillars, &c. (April 1st.)

Bristol.—April 11th. Electricity Department. 39 miles (approx.) 3-core, paper-insulated cable. (March 18th.)

Clayton.—April 18th. Urban District Council. E.h.p. feeder cables, l.p. distributing mains, fuse pillars and transformer kiosk. (April 1st.)

Colombia. — Bogota.—April 30th. Ministry of Public Works. Two electric lifts. (A.X. 4433.)*

Edinburgh.—April 9th. Education Authority. Electric installation at St. Anthony's R.C. School, Leith. Schedules from office of the Authority.
April 18th. Electricity Supply Department. De-aerating plant and boiler feed pumps. (March 25th.)

Glasgow.—April 23rd. Parish Council and District Board of Control. Stores, including electrical fittings and lamps, for six months. Forms, &c., from Mr. A. Reynard, inspector and clerk, 266, George Street, Glasgow.

Ilford.—April 26th. Electricity Department. One 1,500-kW motor-convertor or rotary-convertor and transformer, 6,600-V switchgear cubicles and alterations to existing switchgear. (See this issue.)

India.—India Store Department. April 26th. 66-kVA motor-driven alternator sets, transformers, switchgear, &c. (April 1st.)
Telephone cable. (See this issue.)

London.—Holborn.—April 13th. Board of Guardians. Electric lighting installation at the London Road, Mitcham, schools. (March 18th.)
London County Council. April 12th. Wiring and fittings for electric lighting for Everington Street School, Fulham (approx. 196 points). (April 1st.)
April 22nd. Electrical installation at the Stonhouse Street elementary school, Clapham (approx. 167 points). (See this issue.)
April 26th. Wiring and fitting for electric lighting in two blocks of tenements at the Ring Cross housing estate, Islington (approx. 274 wiring points).
G.W.R. April 21st. Stores, including electrical wires and cables and telegraph ironwork. (April 1st.)

New Zealand.—Wellington.—May 31st. Public Works Department. 50-kVA transformers for the Waikaremoana electric power scheme. (B.X. 3294.)* 50-kVA transformer for Arapuni scheme. (B.X. 3293.)*
June 21st. Sub-station switchgear and metering equipment for Arapuni. (B.X. 3398.)*
June 7th. Railway sub-station equipment, Lake Coleridge electric power scheme. (B.X. 3295.)*
May 4th. General Post Office, Stores Division. Sub-station protectors. (B.X. 3286.)*

June 13th. New Zealand Railways. Machine tools, workshop equipment and overhead electric travelling cranes. (A.X. 4344.)*

June 6th. Six electric locomotives. (A.X. 4355.)* Overhead equipment for the Christchurch-Lyttelton electrification scheme. (B.X. 3301.)*

Invercargill.—May 31st. Southland Electric Power Board. Transformers. (B.X. 3379.)*

June 15th. 66,000-V, oil circuit-breakers. (B.X. 3378.)*

Plymouth.—April 25th. Electricity Department. Electricity meters, cables, and transformers. (April 1st.)

South Africa. — Johannesburg. — May 7th. Municipal Council. Electric street lamp fittings and globes. (B.X. 3395.)* Cables. (B.X. 3406.)*

Cape Town.—June 1st. The University. Electric cooking utensils for the new residences at Groote Schuur. (B.X. 3393.)*

Southend-on-Sea.—April 9th. Light Railways and Electricity Department. Remote-controlled rotary convertors. (March 11th.)

April 19th. 4,000 joint boxes. (March 25th.) 1,400 current limiters. (April 1st.)

Spain.—Madrid.—Ministerio de Fomento. Six electric cranes for the port of Alicante.—*Reuter's Trade Service* (Madrid).

Stafford.—April 30th. Staffordshire Education Committee. Electric wiring and fittings for the new infants' department of the Slater Street Council school and in the additional class rooms, laboratory, &c., in the Salisbury Street central school. (See this issue.)

Uruguay.—Montevideo.—June 15th. State Electricity Supply Works. 15 transformer sub-station equipments (6,600/220 V, 50 cycles). (B.X. 3371.)*

Wrexham.—April 19th. Electricity Department. One 250-kW rotary-convertor equipment and d.c. switchgear. (April 1st.)

---

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Australia.—Melbourne.—Commonwealth P.M.G.'s Department. Accepted :—

Underground and aerial cable.—(£123,303), British Insulated Cables, Ltd.; (£59,832), Connollys (Blackley), Ltd.

Insulated wire (£1,723).—W. T. Henley's Telegraph Works Co., Ltd.

—*Tenders.*

Birkenhead.—Elecricity Committee. Recommended:—

11,000-V overhead and underground transmission lines (£26,308), l.p. distributing mains for Heswall and Gayton (£15,288).—W. T. Henley's Telegraph Works Co., Ltd.

Brighton.—Tramways Committee. Accepted:—

Brake blocks (£144).—Dover Engineering Works, Ltd.
Trolley wire (£84).—Elliotts Metal Co., Ltd.
Steel tires (£222 15s.)—A. Brown & Co.
Tungsten filament lamps (£100).—Kye, Ltd.

Dundee.—The Electricity Committee has decided to accept tenders for cables from three foreign firms in preference to British offers. The foreign quotations (Dutch, Danish, and German) were £648 lower than the British offers.

Eastbourne.—Electricity Committee. Accepted:—

Cable, transformers and switchgear in connection with the ring main (£10,192).—Standard Telephones and Cables, Ltd.

Glasgow.—Tramway Committee. Recommended:—

Welding of rail joints.—Thermit, Ltd.
Special track work.—Hadfields, Ltd.

Corporation. Recommended :—

Additional electrical work at Kelvin Hall (£119).—Edmiston, Brown & Co.

Hull.—Telephones Committee. Recommended:—

3 tons bronze wire (£276).—F. Smith & Co.

Japan.—

Complete radio equipments for three 10-kW broadcasting stations for the Japanese Broadcasting Association.—Standard Telephones & Cables, Ltd.

London.—London County Council Education Committee. —Wiring and fittings for electric lighting, power telephones, electric clocks and bells at Trade School for Girls, Barrett Street, Marylebone :—

E. Wender	£947
Alpha Manufacturing and Electrical Co., Ltd. (accepted)	**995**
Anderson, Angell & Co.	1,062
J. F. Prendergast	1,095
L. G. Tate & Co., Ltd.	1,098
Alex. Hawkins & Sons	1,157
Richard Hunt & Co., Ltd.	1,167
J. Briggs & Co.	1,241
Pinching & Walton	1,365

Post Office.

Telephone switchboard lamps.—Edison Swan Electric Co.,

London, Midland & Scottish Railway Co.

Part contract for the supply of electric lamps.—British Thomson-Houston Co., Ltd.; Metro-Vick Supplies, Ltd.

London & North-Eastern Railway Co.

Electric lamps.—Edison Swan Electric Co., Ltd.

Southwark.—Electricity Committee. Accepted :—

Battery plates (£189).—Alton Battery Co.

Plymouth.—Tramways Committee. Accepted:—

25 tramway standards (£240).—Equipment & Engineering Co., Ltd.

Reigate.—Rural Council. Accepted:—

Wiring and fitting houses at Chipstead for electric light at £4 16s. and £5 12s. each.—County of London Electric Supply Co., Ltd.

Salford.—Baths Committee. Accepted:—

Electric lighting installation at the Hodge Lane baths and washhouse (£268).—R. H. Clampett & Co.

Electricity Committee. Accepted :—

Extras on the contract price on account of delay and additional testing expenses in connection with the supply of turbo-alternators at the Agecroft power station (£3,950). — Metropolitan-Vickers Electrical Co., Ltd.

Dismantling and supplying new pressure part for No. 19 boiler economiser (£1,100 approx.).—Babcock and Wilcox, Ltd.

Tramways Committee. Accepted :—

25 fully-enclosed top covers for tramcars (£15,300).—Massey Bros.

Sheffield.—Electricity Supply Committee. Accepted:—

12,000-V switchgear for Blackburn Meadows generating station.—A. Reyrolle & Co., Ltd.

South Africa.—*The South African Engineer* states that the Electricity Committee of the Durban Town Council is of opinion that a preference of not more than 10 per cent. should be given to goods of British manufacture over those of foreign origin, and has accordingly recommended the acceptance of auto-transformers from Holland, where the saving was 14 per cent., and lamps from Austria, where the saving varied from 14 per cent. to 19 per cent., but in the case of cables for interconnection between Alice Street and Congella power stations, it preferred the lowest British offer, the gross difference in price, compared with cable from Holland, being 9.8 per cent., which would have been appreciably reduced by the consulting engineers' charges for inspection and testing.

Forthcoming Events.

Physical Society.—Friday, April 8th. Imperial College of Science, South Kensington, S.W. 5 p.m. Ordinary meeting.

Junior Institution of Engineers.—Friday, April 8th. 39, Victoria Street, S.W. 7.30 p.m. "Electrical Osmosis." Mr. E. Ambrose.

Women's Engineering Society.—Friday, April 8th. 26, George Street, W. 6.30 p.m. "A Business Woman's Trip to America." Miss E. M. Kennedy.

Royal Institution.—Friday, April 8th. 9 p.m. "Early Days in Radio-Activity." Sir Ernest Rutherford, F.R.S. Saturday, April 9th. 3 p.m. "The Alpha Rays and Atomic Structure." Sir Ernest Rutherford, F.R.S.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, April 9th. School of Mines, Treforest. 6 p.m. "Aerial Wire Ropeways." Mr. J. W. White.

(London Branch).—Tuesday, April 12th. Junior Institution of Engineers. 6.30 p.m. "Mixed Pressure Turbines for Colliery Use." Mr. C. H. Naylor.

Chief Technical Assistants' Association.—Saturday, April 9th. Holborn Restaurant. 7.45 p.m. Annual dinner.

Institution of Electrical Engineers.—Informal Meeting.—Monday, April 11th. London. 7 p.m. "Maintenance of Small Electric Power Plant." Mr. T. Hodge.

(North-Eastern Centre). — Monday, April 11th. Literary and Philosophical Society, Newcastle-on-Tyne. 7 p.m. "The Applications of Electricity to Agriculture." Dr. A. Ekström.

(Scottish Centre).—Tuesday, April 12th. Royal Technical College, Glasgow. 7.30 p.m. "The Applications of Machinery at the Coal Face." Mr. S. Mavor.

(Western Centre).—Monday, April 11th. South Wales Institute of Engineers, Cardiff. 7 p.m. "The Design of City Distribution Systems." Messrs. J. R. Beard and T. G. N. Haldane.

(South Midland Centre).—Wednesday, April 13th. University, Birmingham. 7 p.m. "The Applications of Electricity in Warships." Mr. W. McClelland.

Edinburgh Electrical Society.—Thursday, April 14th. 117, George Street. 8 p.m. Business meeting.

Electrical Power Engineers' Association (Manchester Section).—Thursday, April 14th. Geographical Hall, Manchester. 7.30 p.m. "Rotary Convertors." Mr. E. P. Hill.

(Glasgow Section).—Friday, April 15th. Reid's Restaurant, Glasgow. 7.30 p.m. "Modern X-Ray Plant and Practice." Mr. W. S. Weir.

The "Electrical Review" Service Department.

Inquiries must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

A hand lamp with magnet in base so that the lamp will attach itself to ironwork. Must operate on usual supply voltages.

An electrical band saw brazing machine.

Notes.

Summer Time.

Readers are reminded that "summer time" comes into operation this week-end. All timepieces should accordingly be advanced one hour during the night of Saturday-Sunday, April 9th-10th.

The British Science Guild.

The British Science Guild dinner will be held at the Criterion Restaurant, London, on Thursday, May 13th, when the Rt. Hon. Lord Askwith, K.C.B., K.C., will preside. Amongst the speakers and other guests will be Sir Alfred Mond, Bart., P.C., M.P., Sir Herbert Samuel, P.C., G.B.E., General Sir George Milne, G.B.E., G.C.M.G., K.C.B., D.S.O., and Sir William Pope, K.B.E., F.R.S. Particulars may be obtained from the Secretary, 6, John Street, Adelphi, W.C.2.

Electricity in Mines.

The 1926 edition of the annual volume of "Regulations and Orders under the Coal Mines Act, 1911," has now been published (H.M. Stationery Office, price 1s. net, by post, 1s. 3½d.). In this edition, which contains the Statutory Rules and Orders relating to mines in force on January 31st, 1927, the amending orders have been consolidated with the relative principal orders, and a general subject index has been added.

Public Lighting Conference.

The annual conference of the Institution of Public Lighting Engineers is to be held this year at Brighton on September 12th to 15th. Among the important papers which will be read are one on the "Public Lighting Scheme of the Borough of Brighton," by Mr. John Christie, M.I.E.E., engineer and manager, Brighton electricity undertaking; and a joint paper, "Descriptive of the British Engineering Standards Association's Standard Specification for Street Lighting," by Capt. L. B. W. Jolley, M.A., M.I.E.E., research engineer, General Electric Co., Ltd., and Mr. Robert Watson, engineer and manager, Doncaster gas undertaking. The proceedings will also include the address of the incoming president, Mr. A. C. Cramb, M.I.E.E., engineer and manager, Croydon Electricity Department. During the conference there will be an exhibition of some of the most modern street-lighting appliances.

Electrical Precipitation of Gold.

An electrical device for reclaiming the particles of gold which formerly escaped up the flue of the smelting furnaces has just been installed in the Government Assay Office at New York. In tests, as much as 600 oz. of gold has been reclaimed from 5,000 lb. of dust extracted from the fumes. Electrical action drives the dust particles from the heavy gases; the dust is collected, and the gold recovered by smelting again. Silver and platinum atoms are also arrested by the device.—*Reuter's Trade Service* (New York).

The Engineers' Club (London).

During this month eleven meetings of societies are being held at the Engineers' Club, of which three are electrical.

Appointments Vacant.

Showroom manager for the Westminster Electric Supply Corporation, Ltd. Meter assistant for the Fulham Borough Council, Electricity Department. (See our advertisement pages to-day.)

Service Notes.

From 15 to 20 vacancies for permanent commissions in the Stores Branch of the Royal Air Force will be offered for competition among young men between 23 and 25 years of age who have not less than five years' business experience in a firm of standing. Accepted candidates will be gazetted to commissions as pilot officers on probation, and will be eligible for promotion to the rank of flying officer. Particulars can be obtained from the Secretary, Air Ministry, London, W.C.2.

Electrical Association for Women.

On March 30th, a party of members of the above Association visited the Poplar power station and were shown the new pulverised-fuel plant. During tea at the staff canteen Mr. J. H. Bowden, borough electrical engineer, and Councillor Keys, chairman of the Electricity Committee, outlined the work which is being carried out by the electricity undertaking.

Conference on Extra-High-Pressure Systems.

As announced in our issue of January 7th, the Fourth International High Pressure Transmission Conference is to be held in Paris from June 23rd to July 2nd next. The work of the Conference will be divided into three main divisions, to each of which a couple of days will be allotted, *viz.*, The Production of Power; The Construction of Transmission Lines; and The Operation of Transmission Systems. Two days will also be devoted to excursions and visits to electrical installations in the Paris district.

The Institution of Engineers-in-Charge.

Annual Dinner.—On Saturday last the annual dinner of this Institution was held at the Holborn Restaurant, London. The president, Mr. L. St. L. Pendred, M.I.Mech.E., was in the chair, and amongst the many guests were Mr. W. H. Patchell and Mr. T. Cooper, past-presidents, Eng. Vice-Admiral Sir R. B. Dixon, Sir Henry Fowler (Pres. I.Mech.E.), Eng.-Capt. W. Onyon (Pres. I. Marine Engineers), Dr. W. H. Eccles (Pres. I.E.E.), Sir Philip Dawson, Sir W. J. Berry, Mr. J. L. Musgrave (Pres. I.H. & V.E.), Mr. D. A. Bremner, and Mr. R. H. Hutchinson (Pres. I. Prod. Engineers).

After the loyal toasts, Sir Philip Dawson proposed "The Institution," commenting on the opportunities it afforded the members to interchange information and thus increase the efficiency of their installations, to visit works, and to engage in social intercourse. He urged them to promote that goodwill and co-operation between employers and employed which was indispensable to industrial success, and prophesied that the closing of small generating stations by the Central Electricity Board would not result in loss of employment to their staffs. The president responded, expressing admiration at the efficiency with which the work of the Institution was carried on, and commending the ability and enthusiasm of Messrs. G. A. Hughes and J. E. Watkins, and Capt. A. E. Penn, the hon. secretary. The meetings, he said, were thoroughly practical; the members spoke of what they really knew.

Mr. H. King, vice-chairman, proposed "Our Guests and Friends," expressing gratitude for the support of the leaders of the great Institutions; Sir Henry Fowler, responding, emphasised the importance of the men who used the machines, and Dr. W. R. Ormandy, also responding, referred to the value of meeting men who controlled men. Mr. W. Edwards, chairman, proposed the health of "Our President," quoting a horoscope cast by Capt. Penn; Mr. Pendred, in response, said he was impressed with the active social side of the Institution, and urged that it was essential for all classes to "get together." All the great engineering inventions were British, and if they held together and used all their resources they would come out on top, in spite of the burden of taxation that weighed upon industry.

Mr. W. H. Patchell proposed the health of the hon. secretary, paying a tribute to his industry and efficiency; and Capt. Penn briefly acknowledged the compliment. A programme of music, interspersed with the speeches, contributed to the success of an enjoyable evening.

Gear-Tooth Grinding.

We have received a copy of a pamphlet, "Notes on straight spur gears with special reference to gear-tooth grinding," by A. H. Orcutt. The author advocates the gear-grinding machine as the only solution to the difficulty of keeping the tooth design within the necessary limits of accuracy. With heavily loaded gearing running at high speeds it is necessary for the error of each tooth to be under .0003 in. Advantage can also be gained by using ground gears for light loads and slow speeds. The truing device on the "Orcutt" machine is briefly described, and the process of setting up and inspection by the Gear Grinding Co., Ltd., is given.

Institution Notes.

Institution of Electrical Engineers.

Summer Meeting.—The summer meeting is to be held this year from June 14th to 17th, at the North-Eastern Centre, Newcastle-upon-Tyne. Visitors will assemble at the Central Station Hotel on the Monday evening to meet the Committees of the Centre (Mr. J. Rosen, chairman) and of the Tees-side Sub-Centre.

On the Tuesday morning and afternoon visits will be paid to the Heaton works of C. A. Parsons & Co., Ltd., and the Hebburn works of A. Reyrolle & Co., Ltd., and there will be a civic reception in the evening at Newcastle.

On the Wednesday morning the North Tees power station of the Newcastle-upon-Tyne Electric Supply Co., Ltd., will be inspected, whilst in the afternoon the main party will proceed on an excursion to Durham, and a subsidiary party (limited to 100) will visit the Blackhall pit of Horden Collieries, Ltd. The evening will be free for members to do as they choose.

On the Thursday there will be alternative visits to the Elswick works of W. G. Armstrong, Whitworth & Co., Ltd., or to the Ford Potteries of C. T. Maling & Co., Ltd. (party limited to 60). During the afternoon alternative visits will be paid to the Wallsend shipyard of Swan, Hunter & Wigham, Richardson, Ltd. (party of 150), the Ford Potteries (party of 60), or the new library at Armstrong College, Newcastle, the Council of which will hold a reception and dance in the evening.

On the Friday morning the new steel works and rolling mills of the Consett Iron Co., Ltd., will be inspected; ladies are advised to avail themselves of the alternative excursion to Hexham and the Abbey. In the afternoon both parties will visit the Roman wall and camp at Borcovicus, returning to Newcastle, where an evening reception and dance will terminate the proceedings.

Mersey and North Wales (Liverpool) Centre.—The annual meeting of the Centre will be held at Liverpool on April 25th. The Committee has nominated the following officers for the 1927-28 session:—*Chairman*—Prof. F. J. Teago, D.Sc.; *vice-chairmen*—Mr. S. E. Britton and Prof. E. W. Marchant, D.Sc.; *ordinary members of committee* (four vacancies)—Mr. G. D. Coe, Mr. H. C. Hazel, Mr. W. M. Horsfall, Mr. E. V. L. Mathias, and Mr. J. L. F. Vogel; *hon. secretary and treasurer*—Mr. Oscar C. Waygood.

Western Centre Summer Meeting.—The week-end summer meeting of the Centre this year is to take the form of a visit to Plymouth, where the chairman, Mr. W. G. Heath, resides, from Friday, May 20th, to Monday, May 23rd. It is proposed to make the journey by charabanc, starting from Weston-super-Mare if the steamers are running, or from Bristol; ladies are specially invited.

The Faraday Society.

Change of Address.—It is announced that the Society has changed its address to 13, South Square, Gray's Inn, London, W.C.1; its telephone number is Chancery 7230.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.

The appointment of Mr. Archibald Page, M.I.E.E., to be chief engineer and manager to the Central Electricity Board, which was briefly mentioned in our last issue, marks an important step towards the organisation of the staff of that body. Mr. Page, whose portrait is here reproduced, is a native of Alloa, N.B., and was educated at Dollar Academy; he received his technical training at the Heriot-Watt College, Edinburgh, and the Royal Technical College, Glasgow. After practical service at the Broad Street Engine Works, Alloa, and Messrs. Mavor & Coulson's, at Glasgow, he joined the staff of the Glasgow Corporation Electricity Department in 1899, and quickly rose to the position of chief assistant engineer under Mr. W. W. Lackie, and deputy chief engineer, positions which he occupied from 1905 to 1917. He then became assistant general manager to the Clyde Valley Electrical Power Co., and two years later general manager. In 1920 he was appointed one of the first Electricity Commissioners. At the end of June, 1925, Mr. Page returned to active participation in the electricity supply industry, becoming a director and general manager of the County of London Electric Supply Co.

His new post is perhaps the most important, and certainly the most onerous, that is open to the ambition of electrical engineers in this country. As engineer to the Board, Mr. Page will be charged with the duty of carrying out the schemes of interconnection and transmission on a colossal scale which are being prepared by the Electricity Commission for submission to the Central Electricity Board; as manager he will conduct an enormous commercial enterprise—the purchase and resale of more than half the total output of the statutory undertakings of the country. But as nothing has been done yet, and it will take time to build up the huge machine and get it into motion, his work for the present will be mainly constructive, laying the foundations well and truly for the structure that will be erected during the next ten or twenty years—the most important commercial undertaking in the Empire. He will take up his new duties on May 1st.

Mr. Page, who has been a vice-chairman of the Scottish Centre, is a vice-president of the Institution of Electrical

Lajayette] *[Glasgow*

Mr. Archibald Page,
Chief Engineer and Manager to the Central Electricity Board.

Engineers; he is held in the highest esteem by his electrical *confrères*, on account of his professional ability as well as his personal qualities, and his appointment will restore the confidence of many whose anticipations of the working of the Act were far from optimistic.

Mr. A. S. Blackman, general manager and engineer of the Sunderland Corporation Electricity Department, has returned from the three months' leave of absence which the Corporation granted him upon his completion of 20 years' service.

Mr. George Offor had many callers and a host of congratulatory letters and telegrams from his friends on March 30th, when he attained his hundredth birthday. The King and Queen sent a telegram wishing him peace and happiness for the remainder of his days, and among the day's callers at Peak Hill Villa, Sydenham, were Sir Philip Dawson, member for the Division, and Lady Dawson, and a delegation from the British Electrical Federation, Kingsway. A brief thanksgiving service, conducted by local ministers, was held at the house, which was decorated with many floral gifts.

At Colne, on March 31st, Mr. Edgar Duckworth, of the London and Provincial Radio Co., was married to Miss Emily Stansfield, of Foulridge.

Accrington Council is recommended to confirm an increase in the salary of Mr. A. W. Clegg, the electrical engineer, from £866 to £913, with a further addition of £50, with bonus at the full rate then prevailing, from April 1st, 1928.

Mr. John Macleod, secretary of the Oriental and China and Japan Telephone Companies, retired on the 31st ult., after 45 years' service.

About 100 members of Blackpool Athenæum Club assembled on March 31st, when a dinner and dance were held in honour of the chairman, Mr. Charles Furness, borough electrical engineer.

The salary of the Perth Corporation electrical engineer has been increased by £25.

The *Financial News* reported last week that Lord Ampthill and Major O. Sumner, O.B.E., accompanied by their principal contracting and electrical experts, had left Southampton by the R.M.S.P. *Andes* in connection with important public works developments in the Argentine Republic.

The *Daily Telegraph* states that Sir James Parr, the High Commissioner for New Zealand, has been nominated by the New Zealand Government as its representative on the reconstituted Pacific Cable Board.

Mr. Robert Allan, of Messrs. Allan & Mayes, electrical engineers, Falkirk, was presented with a clock by staff and friends on the occasion of his marriage.

As we briefly reported last week, Mr. S. J. Watson, borough electrical engineer of Salford, has been appointed chief engineer to the London and Home Counties Joint Electricity Authority. Mr. Watson went to Salford over four years ago, relinquishing a similar post at Bury, which he had held since 1896. Prior to that he was station superintendent to the National Electric Supply Co., Preston. In 1917-18 he was president of the Incorporated Municipal Electrical Association, and he has been chairman of the Manchester local section of the Institution of Electrical Engineers.

Mr. S. J. Watson, M.Inst.C.E., M.I.E.E.,
Chief Engineer to the London Joint Electricity Authority.

Mr. Watson's resignation came before the Salford Electricity Committee on March 30th. In accepting it the Committee expressed its regret at losing Mr. Watson, and placed on record its high appreciation of his services and abilities. Congratulations on his new appointment were also extended to him. The Committee decided to invite applications for the position of city electrical engineer at a salary of £1,500 inclusive, rising by annual increments of £100 to £2,000.

Obituary.—Mr. W. R. Mickelwright.—The death of Mr. W. R. Mickelwright, to which we briefly referred last week, occurred on March 23rd. He was managing director of Mickelwrights, Ltd., electrical engineers, of Alperton, Wembley. He received his early training at Finsbury Technical College, leaving there to take up a post with the Central London Railway. He founded the firm of Mickelwrights, Ltd., in 1912, and served during the war in the Royal Naval Air Service. He had a large circle of business friends, and the Wembley Radio Society had in him a popular secretary.

Eng.-Com. W. Dobson.—We regret to record the death, which occurred on March 29th, at Wembley, after a few hours' illness, of Engr.-Commander William Dobson, R.N.R., M.I.E.E., superintendent electrical engineer at Stonebridge Park power station of the L.M.S. Railway. After serving an apprenticeship with Vickers-Maxim's at Barrow-in-Furness from 1889-1892, he became engineer-in-charge of various liners of the P. & O. S.N. Co., and was granted a commission in the Royal Naval Reserve in 1896. From 1898-1904 he was assistant engineer in the Whitehall Court, Rathbone Place and Amberly Road stations of the Metropolitan Electric Supply Co., Ltd. In 1904-1905 he was operation and guarantee engineer for the Neasden power house contract (Metropolitan Railway) on behalf of the British Westinghouse Co. Then followed seven years (1905-1912) as assistant electrical engineer with the Metropolitan Railway in charge of the electrical operation of the power house and sub-stations, also the train equipments; and, finally, service from 1912 to 1927 as superintendent electrical engineer at Stonebridge Park power station, as stated above. He was 58 years of age.

Mr. G. A. Schanschieff.—We regret to record the death, at the early age of 49 years, of Mr. George A. Schanschieff, for 25 years managing director of the Premier Accumulator Co., Ltd., of Northampton. Mr. Schanschieff passed away on Saturday last after a short illness, at his residence, North View, Marriott Street, Northampton. The works of the company were closed on Tuesday, the day of the funeral. The deceased gentleman was a son of the late Mr. A. Schanschieff, so well known in London many years ago as a battery inventor and expert.

Mr. S. Aspen.—The death is announced of Mr. S. Aspen, who was for many years connected with the Scarborough Tramway Co., of which he was a director. He was 72 years of age.

Mr. W. Chadburn.—*The Times* records the death, on April 3rd, of Mr. William Chadburn, chairman of Chadburn's (Ship) Telegraph Co., Ltd., in his 84th year.

Mr. R. Crush.—The death has occurred, at the age of 68 years, of Mr. Robert Crush, who was for a number of years on the staff of the Electric Supply Corporation at Chelmsford.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Frigidaire, Ltd.—Incorporated outside the United Kingdom. Particulars filed on March 24th. Capital is $25,000 (United States) in 250 shares of $100 each. The company was incorporated in Canada on September 1st, 1926, to manufacture and deal in mechanical and electrical devices, machines, engines, refrigerators, appliances and apparatus of all kinds, especially pumps, washing machines, and other household devices, &c. The chief place of business is at Toronto. British address: Imperial House, 19, Kingsway, W.C.2. H. L. McGurk is authorised to accept service of process and notices on behalf of the company.

W. Hammerl & Co., Ltd.—Private company. Registered March 28th. Capital, £600 in £1 shares. Objects: To carry on the business of manufacturers, importers, exporters, and repairers of and wholesale and retail dealers in all kinds of electric and other lamps, and apparatus for wireless telegraphy and telephony and television, &c. The first directors are:—W. Hammerl, 56, Minster Road, West Hampstead, N.W.2; H. J. McCarthy (permanent), 23, Staverton Road, Brondesbury Park, N.W.2. Secretary: M. J. McCarthy. Solicitors: Romain & Romain, 132, Seymour Place, Bryanston Square, W. Registered office: 4, Norfolk Mews East, Paddington, W.1.

Radio Investigations, Ltd.—Private company. Registered March 29th. Capital, £90 in £1 shares. Objects: To assist in and finance, research, investigation, inquiry into and experimenting upon, developing and perfecting all matters connected with electrical and photographic knowledge and apparatus in connection with such matters, including wireless transmitting and receiving apparatus, kinematograph films, &c. The subscribers (each with one share) are:—L. A. Levy, D.Sc., 31, Shoot-up-Hill, Cricklewood, N.W.2; D. W. West, 5, Shalimar Gardens, Acton, W.3, research chemist. Solicitors: Oliver Richards & Park, 1c, King Street, St. James, S.W.

Partridge & Mee, Ltd.—Private company. Registered March 31st. Capital, £4,000 in £1 shares. Objects: To carry on the business of manufacturers and importers of and wholesale and retail dealers in all kinds of electric telephones and telegraphs and all apparatus used for and connected with the transmission and reception of telephonic, telegraphic and radio telephonic and telegraphic communications, &c. The first directors are:—C. A. F. Partridge (chairman), 6, Clarendon Park Road, Leicester; S. N. S. Mee, 48, Queen's Road, Leicester; V. F. Hewitt, Budden Lane, Quorn, Leics. The first two named are permanent. Solicitors: Stone, Davis, Savage & Partridge, 4, Welford Place, Leicester.

C. P. Ribton, Ltd.—Private company. Registered April 1st. Capital, £500 in £1 shares. Objects: To carry on the business of electrical, mechanical, and general engineers, manufacturers of and dealers in engineering plant and accessories, dealers in motor vehicles, machinery, &c. The subscribers (each with one share) are:—P. A. C. Ribton, 34, Allington Street, Liverpool, electrical engineer; Mrs. A. Ribton, 34, Allington Street, Liverpool. P. A. C. Ribton is the first director. Registered office: 44, South Castle Street, Liverpool.

Jays & Co. (Engineers), Ltd.—Private company. Registered April 1st. Capital, £700 in £1 shares. Objects: To carry on the business of general and electrical engineers, lubricating ring and general manufacturers, &c. The first directors are:—W. Hinson, 25, Irving Street, Edgbaston, Birmingham, engineer; H. Hinson (same address), engineer. Qualification: Two shares. Registered office: 188a, Bromsgrove Street, Birmingham.

Baird Television Development Co., Ltd.—Public company. Registered April 1st. Capital, £125,000 in 100,000 10 per cent. preferred participating ordinary shares of £1 each and 500,000 deferred ordinary shares of 1s. each. The objects of the company are to test, exploit, exercise, develop, manufacture, exhibit, use, let out on hire, grant licences in respect of, sell, and generally turn to account and trade with inventions relating to a system of transmitting views, portraits and scenes by telegraphy or wireless telegraphy, &c., and to enter into certain agreements, the parties to which are not named. The minimum cash subscription is 7 shares. The first directors (to number not fewer than 3 or more than 8) are:—Sir Edward Manville, Kt., 3, Whitehall Court, S.W. (chairman of Daimler Co., Ltd.); Sir James C. Percy, Kt., "Ardenvohr," Cowper Road, Dublin (chairman, Sackville Press); F. R. A. Shortis, Firfield, Weybridge, banker; J. L. Baird, 975, Finchley Road, N.W., inventor (director of Television, Ltd.); O. G. Hutchinson, 87, St. George's Road, S.W. (director Television, Ltd.). Subject to any contract or appointment made, and to the maximum number of directors fixed as above, Television, Ltd., shall, being by itself or its nominees the holder of 300,000 deferred ordinary shares, have the right at all times to nominate and appoint half the directors. One of the directors so nominated and appointed shall, if required by that company, be chairman. Qualification (other than O. G. Hutchinson and J. L. Baird, whose qualification shall be £100): £500 shares. Remuneration: £300 each per annum (chairman £100), free of income tax. Solicitors: Kenneth Brown, Baker, Baker, Lennox House, Norfolk Street, W.C.

Official Returns of Electrical Companies.

Radions, Ltd. — Mortgage debenture dated March 8th, 1927, to secure £800, charged on the company's undertaking and property, present and future, including uncalled capital (ranking *pari passu* with debenture for £1,200 issued October 26th, 1926). Holders: R. Dobson and R. T. Hindley, Mosley Street, Manchester.

Windsor Electrical Installation Co., Ltd.—Satisfaction in full on March 9th, 1927, of mortgage dated March 11th, 1902, securing £20,000.

A. E. Tribe & Co., Ltd.—A. E. Tribe, of 18, London Street, Basingstoke, ceased to act as receiver on March 24th, 1927.

Allen, West & Co., Ltd.—Capital, £150,000 in £1 shares. Return dated February 22nd, 1927. 141,724 shares taken up. £141,724 paid. Mortgages and charges, £60,000.

Electric Advertising Clocks, Ltd. — Capital, £36,000 in 30,000 ordinary shares of £1 each and 120,000 deferred shares of 1s. each. Return dated January 6th, 1927. 27,492 ordinary and 120,000 deferred shares taken up. £8,600 paid (being 10s. per share on 17,200 ordinary shares). £16,292 considered as paid (being £1 per share on 10,292 ordinary and 1s. per share on 120,000 deferred). Mortgages and charges, nil.

General Cable Manufacturing Co., Ltd.—Particulars filed of £60,000 debentures authorised March 18th, 1927, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued. Also registered, a debenture of same date to secure £10,000 with a bonus of £1,000, charged on the company's property, including uncalled capital, subject to above debentures. Holder: H. Bisseker, c/o E. G. Bisseker, 1, Balderton Street, Satisfaction in full on March 18th, 1927, of debentures dated October 26th, 1923, and January 2nd, 1924, securing £20,000 and £5,000 respectively.

B. A. Manufacturing Co., Ltd.—Issue on March 23rd, 1927, of £500 debentures, part of a series already registered.

City Notes.

English Electric Co., Ltd.

The annual meeting was held on March 30th, Mr. P. J. Pybus presiding. In moving the adoption of the report, the chairman said that while the industrial disputes were not the sole cause of their troubles, no group such as theirs could operate profitably under the labour conditions which dislocated their shops for the major portion of last year. Having referred to some of the principal items in the balance sheet, he said that the continued existence of unbridled competition for export work had also been a disquieting feature of the year. Not only their company, but other British companies engaged in the manufacture of heavy electrical plant, starting with the laudable object of defeating the foreigner, had too often found themselves defeating one another in a race for extra output as a corrective for too low prices. Competition in the heavy electrical industry had been carried to a point of wastefulness, and was, from the national point of view, a costly rivalry. That was now generally recognised, and it was to be hoped that some arrangement would be made by which the destructive internecine competition between all the principal companies engaged in the heavy trade for foreign work could be reduced. It needed but a small increase of the selling prices of their invoices for export—certainly not more than three per cent.—to change entirely the result of a year's trading, and to put the heavy business on to a reasonably sound footing. That fierceness of competition was partly a legacy of the war, and the optimism which followed its conclusion. By the amalgamation of 1918 they secured six businesses with works at Preston, Coventry, Stafford, Rugby and Bradford. At two of those works considerable extensions were already in hand at the time of the amalgamation. The optimism of 1918 affected almost every type of business, and they, in common with many other concerns, set out to re-equip their shops for what had so far proved to be an output which they could not secure. Lack of purchasing power abroad, combined with the surplus of producing capacity at home, had brought down prices from two-and-a-half times above pre-war to a point at which, in certain cases, they were little more than 25 per cent. above pre-war. By the end of 1921 it became obvious that not only was the producing capacity greater than the orders necessary to fill it, but that the selling price and consequent gross margin of profit were falling with unexpected rapidity. In February, 1922, a drastic scheme of re-organisation of the works was put in hand and rigid economies were enforced. One great works was closed down, the manufactures of the others were grouped according to type and size, and each works undertook the manufacture of one class of goods, in order to secure for each plant as much repetition work as possible. Then, to effect another economy, the de-centralisation of the London technical organisation to each works was undertaken as far as possible. That was fully completed last November, and the major activities of each works were now concentrated at that centre. The last phase of reconstruction and economy, most of which would have effect during the current year, would bring down expenses to an absolute minimum, and would give them a reasonable expectation of orders at a profit. While they hoped to increase their home business, they were obtaining a fair share of it, but the necessity of filling their works and covering their overhead charges made it essential for them to secure a large amount of export trade. The company depended almost exclusively on orders for heavy electrical and mechanical plant. It did not manufacture cables, lamps or wireless equipment. The prosperity which those light and ancillary products were at the moment enjoying in this country and in America, thanks to a strong patent position or some other cause, had probably tended to reduce price levels in the heavy engineering side, particularly in the export trade. That was, in his opinion, the only explanation of the absurd prices quoted for railway electrification and similar installations in foreign countries and our own Colonies. They had examined each of those ancillary businesses on which, for the moment, the margin of profit was considerable, and were still looking into many more developments; but in general principle they had felt that their only sound course was to concentrate their energies and resources towards a perfecting and extending of the business which they inherited, which they thoroughly understood, and for which their works were specially designed and laid out. Notwithstanding this policy they were constantly seeking for new outlets, directly or indirectly, ancillary to their main operations, and several lines had been developed and were now at the stage of financial success. For instance, the ordinary Diesel and semi-Diesel engine had been established for many years, and was the object of fierce competition. They felt that, if they could develop a new type of oil engine which could safely be carried into sizes larger than was possible with the ordinary Diesel engine, they could secure a market in which there were fewer competitors. That was actually what had happened with their Fullagar engine, and to-day they stood in an unrivalled position in that particular class of work.

That engine was operating with great success in waterless oil fields, in the Sudan, in the Colonies and at home. Thirty-five per cent. of the business consisted of repeat orders. Again, the company had entered the water-wheel business, partly for itself and partly for the orders for electrical plant which it carried with it. In 1922, American competition practically destroyed other British competition, and to-day they stood in the position of being the only British manufacturers capable of producing large water-power units complete with their electrical adjuncts. In conclusion, Mr. Pybus expressed his confidence for the future. A large increase in the electrical business, which had been too long delayed, could not be indefinitely postponed. Delayed legislation in this country and lack of purchasing power abroad had reduced demand and increased competition. That condition could not be permanent, and with a revival in trade should come a fair world selling price. Their works were never in better shape nor their products so good. Their expenses had been reduced enormously, and were still coming down. New types of manufacture had been perfected, new markets had been opened up and were rapidly being consolidated. Their products were well known and favourably regarded all over the world. Further, if to their present large order book they added a very conservative amount for the normal everyday business on which they might rely, that would suffice to keep four out of their five works employed for the remainder of the year. The report and accounts were adopted.

County of London Electric Supply Co., Ltd.

This company's report for 1926 was reviewed in our issue of March 18th (p. 443). The annual meeting was held on March 29th, when Sir Harry Renwick (chairman), in the course of his speech, referred to the capitalisation of £1,773,334 of the reserves and its distribution as ordinary shares. The company's revenue had been adversely affected by the industrial troubles of the past year. Preparations had been made for the supply of electricity to large power consumers who had been unable to take the supply until a much later date than had been anticipated. In addition to that the company had had to pay exorbitant prices for coal, some of which was of very inferior quality. Dealing with the question of the allocation of capital and assets as between the inside and the outside areas, the chairman said that the provisions of the London Electricity (No. 1) Act, 1925, as to sinking funds, standard price and dividends, did not apply to the outside areas, and profits received from those areas would go to swell the profits of the company, and should be available to increase, if desirable, the dividends over and above the standard fixed by the Act. The dividend for the past year was equivalent to 16⅔ per cent. on the old capital, as compared with 15 per cent. for 1925. The authorities had had to agree to the company's schedule of values of assets and they had practically accepted the value shown in the company's books, which meant that the plant was modern and up-to-date. During the year the company's holdings in the South Metropolitan and South London Companies were increased by those companies' bonus issues; further advances towards extensions were made to a subsidiary company. The balance of the reserves remaining was £130,649; that belonged to the shareholders as part of the undistributed reserves. At the beginning of the year the company had reduced its rates for supply by 10 per cent., but that decrease had to be rescinded. After reviewing the accounts, the chairman pointed out that it would not be necessary in future to make provision for depreciation on the same lines as previously, as the matter was dealt with by the sinking funds established by the Act. He pointed out that, in spite of the troubles of last year, progress had been made, and said that an additional area of 33,000 acres with a population of 75,000, had been opened up by the company's distributing mains. It was hoped to have the new Barking extensions ready for service this year, but their calculations had been upset. Referring to the Electricity (Supply) Act, 1926, Sir Harry said that it undoubtedly had great possibilities for good; the Act as passed was a great improvement upon the original Bill. It behoved all who had the interests of the supply industry at heart to co-operate with the Central Board to make the Act a success. By a "sentimental side issue" the Bill for the extension of the company's powers in Essex was defeated in the House of Commons; a less controversial Bill was being promoted. To show that the companies were working in accordance with the spirit of the London Electricity (No. 1) Act, 1925, Sir Harry mentioned that the generating stations of the group had been interconnected and also that the Barking station had been linked up with the North Metropolitan Company's Brimsdown station and the Kent Power Co.'s station at Rochester. After mentioning the social activities of the staff and the acquisition of new premises, the chairman said that the prospects were never brighter and they looked for largely increased output and revenue. The report and accounts were adopted.

British Electric Transformer Co., Ltd.

The annual meeting was held on March 29th, Mr. A. F. Berry presiding. In moving the adoption of the report (Electrical Review, March 25th, p. 488), the chairman, after referring to the loss which the company had sustained during the year by the deaths of his brother, Mr. George Berry, who had been a member of the board and manager since 1907, and Mr. Roothaan, one of the oldest engineers in the company's service, said that the net profit had increased by 12 per cent. It was proposed to pay 12 months' dividend on the cumulative preference shares, bringing the dividend up to date, and 5 per cent. on the ordinary shares. Mr. Berry said that 1926 had been the most difficult year of a bad series. Referring to the general strike, he said he need hardly say that practically the whole of those employed by the company did their utmost to help the community. The long drawn out coal strike caused them the gravest anxiety with regard to supplies of raw materials, and the consequences of the bitter fight would be felt for a long time by many industries, including their own. There were, however, some hopeful signs and illuminating rays among those dark clouds. Having at last seen their error, millions in this country had tightened their belts and now endeavoured to do their day's work more cheerfully. The question before them always at their works was how to get orders and execute them so quickly and well as to ensure future business. The competition in the engineering world was both national and international. There was an effect of the coal strike upon the junior branch of their business to which reference should be made. For many years the company had led a campaign in favour of electric heating and cooking. They knew that the more they could stimulate the orders for electric heating and cooking apparatus the larger would the need for transformers become. Their electric cookers, fires, radiators, kettles, toasters, &c., had steadily been improved, and as a result of much demonstration work and publicity, the public turned to them when coal was almost unobtainable. Their entire output was taken through municipal and other supply authorities and greatly appreciated by thousands of householders. The effect of the extended use of electricity for domestic and kindred purposes consequent upon the coal strike would undoubtedly be very marked in the near future. They were taking steps to care for both the publicity and output sides of that business during this year. It was hoped that early next year, if not before, they might reap substantial benefit as the result of their efforts. The "Tricity" Restaurant, which did excellent service as purveyor and propagandist at Oxford Street, succeeded in making the premises which it occupied too valuable for retention as a restaurant. A new "Tricity" Restaurant in the Strand had been opened. They intended to open showrooms in the same building block, and he had no doubt of the ultimate success of this branch of their sales business.—The report was adopted.

London Electric Supply Corporation, Ltd.

The annual meeting was held on March 31st. Mr. R. H. Benson (chairman), in moving the adoption of the report (*vide* our last issue, p. 528), said that notwithstanding the adverse conditions of the past year, the company's profit had only declined slightly. After referring to the issue of £199,800 of the reserves as bonus shares, Mr. Benson said that the demand for energy continued to increase, and the year's output was over 45 per cent. above that of 1925. The average revenue per kWh had decreased by 9 per cent. The high cost of fuel and rates had had a marked effect upon production costs. The amount of rates paid had increased from £39,783 in 1925 to £76,586 last year—an increase of over 90 per cent.; that figure would be still further increased in the current year. The amount paid represented over 10 per cent. on the whole of the ordinary share capital, and with coal at normal prices was over 30 per cent. of the works costs. The supply to the Southern Railway had materially increased during the last few months. In future, the London Power Co., of which the company was a constituent, would supply the whole of the company's requirements and those of nine other constituent companies. During the general strike 85 per cent. of their men left work, but with the assistance of the remainder of the staff and volunteers the company was able to maintain a full supply. Mr. Benson referred to the Electricity (Supply) Act, and said he hoped that the London companies would be allowed to carry out the obligations under their own Acts without hindrance. If they were, he felt confident that they would combine to assist the Central Board in its task of unifying and consolidating electricity supply. During the past year the company had concentrated to a greater extent upon the development of its residential area, and considerable extensions of mains were made. The public was beginning to realise that the adoption of electricity had many advantages of which it was previously unaware, and the company hoped to obtain increased revenue from domestic consumers within the next few years. With regard to the current year, he thought that, given industrial peace, output and revenue should greatly increase.

Clyde Valley Electrical Power Co.

Among the matters referred to by Sir Frederick Gardiner, K.B.E., at the annual meeting on March 30th, were the passing of the Electricity (Supply) Act and the constitution of the Central Electricity Board. With regard to the Bill he confined himself to expressing the hope that the Central Board would examine and weigh each proposal with great care in order to ensure that the results likely to be attained were commensurate with the expenditure involved. There was reason to believe that a scheme for Scotland would be published without delay, shortly after Easter. The directors would receive it with sympathy, but it would be their duty to subject it to thorough examination. They sincerely trusted that it might be found to further public interests, and that it would deal equitably with the shareholders and consumers of that

company. Should they be disappointed in that regard, the directors would naturally feel bound to take all steps open to them to protect the interests confided to their care. That was the policy they had always pursued, and the company would not fail to discharge its obligations to the area it served. After dealing with the difficult conditions caused by the coal stoppage, Sir Frederick said the company had not lost its vitality. Large sums still fell to be spent under the head of "mains," so that in the area entrusted to their care the demand for electricity might be fully met. As the demand grew additional generating plant would be required, but when and where the plant was to be installed was a matter which would largely be decided by the Central Electricity Board. Work on the hydro-electric scheme at the Falls of Clyde had been delayed. It was expected, however, that the plant would be completed in time for next winter's load. In conclusion, the chairman said that if the energy which was at present devoted to domestic conflict were spent in a united endeavour to recover our trade, he did not doubt that they would find ample reward. He had too much faith in the inbred sagacity and commonsense of all classes of the people to believe that they would continue to be led astray from their plain duty and obvious interest.

Charing Cross Electricity Supply Co., Ltd.

Mr. W. F. Fladgate (chairman) presided at the annual meeting on March 30th, and prefaced his speech with congratulations to Mr. J. M. Gatti upon his appointment as chairman of the London County Council. Dealing with the report (Elec. Rev., March 25th, p. 485), Mr. Fladgate said that although there had been an increase in the sales of energy of 9¾ million kWh, most of the increase was attributable to two large bulk supply consumers—the Metropolitan Electric Supply Co. and the Post Office. The receipts were about the same as in 1925, but it should be borne in mind that substantial reductions had been made in the charges. The chairman then dealt in some detail with the capitalisation of the reserves, &c., and pointed out that the company had only earned about sufficient last year to pay the standard dividend, but the conditions in 1926 were not normal. Efforts were being made to improve the distribution system. A new 1,500-kW automatic sub-station was started up in October last to supply the electricity required in the Soho Square area; that was the first station of its kind in London, and the first anywhere which was entirely underground. A saving of 8 per cent. in the distribution losses had thus been made. In conclusion, the chairman thanked those of the staff who loyally remained with the company during the general strike. The report and accounts were adopted.

Ericsson Telephones, Ltd.

The annual meeting was held on March 30th under the chairmanship of Mr. W. M. Crowe, who, in presenting the report and accounts (Elec. Rev., March 25th, p. 486) expressed the directors' regret at the recent death of Mr. L. M. Ericsson. He said that the issue of about £100,000 seven per cent. cumulative preference shares had met with success; and he also referred to the issue of £200,000 of ordinary shares as a bonus. Their associated company would soon be placing some surplus ordinary shares on the market and permission to deal in those shares had been granted on the Stock Exchange. The results of the past year were highly satisfactory in view of the extremely difficult nature of the period. The future was not altogether free from clouds; the air had to be cleared of the mistrust and suspicion which marred the past year, and it had to be realised that capital and labour were interdependent and not antagonistic. Telephone expansion in this country reached a record level last year, but there was tremendous scope for still greater progress. Orders received during the current year were encouraging, although prices were lower. One important development was the changing over to the automatic system. The company had made a study of this branch and had recently received a number of contracts for automatic exchanges, and further orders were hoped for. The report and accounts were adopted.

Anglo-Portuguese Telephone Co., Ltd.

Viscount St. Davids (chairman) presided at the annual meeting last week, and in presenting the report and accounts (*vide* our last issue, p. 528) said that the company had a bad record as a payer of dividends. Since an interim dividend in 1920, nothing had been paid until last year, when they were able to distribute 7 per cent. In 1924 and 1925 the profits made were used for capital expenditure. Last year, however, they raised their capital and freed themselves from that position. Little damage was done to the company's property during the Portuguese disturbances in February, and the company had done useful work in maintaining communications. They had been in negotiation with the Portuguese Government for a new or extended concession. After about 12 or 18 months, further capital would be required, and the raising of the necessary amount depended upon an extension of the concession. At the present time the company had issued £300,000 on debentures, while £100,000 remained unissued. All the loans had been paid off, and the old 5 per cent. first debentures and extension debentures would be cleared off by May next. The standard rate of dividend for telephone companies was considered to be 8 per cent., and they hoped to reach that rate next year. The report and accounts were adopted.

Lancashire Dynamo and Motor Co., Ltd.

The report for 1926 states that the company's sales were greatly curtailed by the coal dispute; the profit was reduced from £20,201 to £6,801. As the provision for taxation has proved greater than necessary, a part of it (£15,000) is put to the credit of the profit and loss account. Including this and the balance of £2,147 brought forward, the amount available is £23,948. From this the preference dividend and directors' fees are paid, £10,000 is transferred to reserve (making £75,000), an ordinary dividend of 5 per cent. is to be paid (as compared with 7½ per cent.), and £4,128 is carried forward. During the year an agreement for taking over the Crypto Company by an exchange of shares was concluded and powers have been taken to create the additional shares required. The two companies have worked amicably together for seven years and the complete fusion is expected to be still more advantageous. Mr. F. J. West has been compelled by pressure of other business to resign from the board. Mr. S. G. Shaw, the representative on the board of the Crypto Company, vacates his position owing to the amalgamation, but he and his brother (Mr. C. R. Shaw) have been elected directors.

Waste Heat and Gas Electrical Generating Stations, Ltd.

The annual meeting was held on March 25th, Mr. E. Lloyd Pease presiding. The chairman said that no new development had been undertaken during the year. The instalments received during the year in respect of the purchase of the stations under the agreement which was entered into in 1922 amounted to £21,478; the total unredeemed capital expenditure was £219,193. Their investments had been increased by £18,360 and this had been invested in 3½ per cent. Conversion Loan. The total investments were £142,862 and the income therefrom for the year was £7,313, or £1,000 more than last year. The decrease in revenue, due to the reduction in the output from the power stations, was £4,700. All their stations were shut down completely immediately after the commencement of the strike in May and continued so until the end of November or the middle of December. One station, at Weardale, using surplus gas and waste heat from coke ovens, had not yet been commercially started up. The present outputs of the stations were good and the indications were that they would continue to be so during the year.

British Aluminium Co., Ltd.

Speaking at the annual meeting, on March 31st, Major R. W. Cooper, O.B.E., M.C., said that the general strike and coal stoppage had affected every branch of the business, causing a fall of over £100,000 in the net profit. In certain directions the demand for aluminium had developed, particularly in the electrical industry, whose demand last year was double that in 1925. That was the result of the continued good service of aluminium in practice. It was anticipated that the Electricity (Supply) Act would stimulate the use of aluminium for electrical purposes. Other favourable developments occurred in the use of the metal for engine work and domestic utensils. The civil engineering work on the Lochaber hydro-electric scheme was progressing, and during the past year actual tunnelling operations were commenced. The pier to serve the aluminium factory had been completed and the factory and power house foundations had been commenced.

A. Reyrolle & Co., Ltd.

The report for the past year shows a profit of £83,351 (against £70,621 in 1925), to which is added a net amount of £29,123 brought forward, making £112,474. After transferring £15,000 to the reserve account and meeting the preference dividend, it is proposed to pay a dividend of 12½ per cent. on the ordinary shares, as in 1925, leaving £49,674 to be carried forward. The capital expenditure during the year was £19,098, mainly upon machine tools. The report records the death of Mr. W. Negus, who had been a director since the formation of the company, and the appointment to the board of Messrs. F. Coates and H. W. Miller, who have held responsible positions with the company for a number of years. The meeting was to be held yesterday (Thursday).

Gateshead and District Tramways Co.

The total revenue for the past year was £125,611 (as compared with £138,448 in 1925), and the balance on the year's working was £18,235 to which is added £31,410 brought forward, making £49,645. After providing for mortgage redemption and preference dividends, it is proposed to pay a dividend of 10 per cent. on the ordinary shares and to carry forward £23,342. The report says that the traffic receipts fell by 9 per cent., while the local rates payable by the company increased by 49 per cent.

Kensington and Knightsbridge Electric Lighting Co., Ltd.

Col. R. E. Crompton, C.B., presided at the annual meeting on March 31st, and in presenting the report, which was reviewed in our last issue (p. 528), said that during the past year it was hoped to devote a great deal of effort to the further development of the company's domestic business, as distinct from lighting, but the financial rearrangements had absorbed the attention of the staff and the board. In the company's case that matter was complicated by the fact that it was not sole owner of the Wood Lane works. Even now the standard price had not been fixed, and while the company was paying the standard dividend for 1926, he could not say what would be paid for the current year. The indications of increasing

demand were very encouraging. The effects of the coal dispute had been to increase the cost of coal, and the restrictions imposed almost nullified the increase in output which was anticipated when the charges were reduced at the beginning of the year. The output had risen by only 3.15 per cent., and the average revenue per kWh had fallen from 3.21d. to 3.03d. Col. Crompton thought that the industrial outlook was favourable and referred to the establishment of a pension fund for the company's employés.

Stock Exchange Notices.

Dealings in the following have been specially allowed by the Committee under Rule 159 :—

Folkestone Electricity Supply Co., Ltd.—40,000 new ordinary shares of £1 each 4s. paid, Nos. 100,001 to 140,000.

North Wales Power Co., Ltd.—59,918 ordinary shares of £1 each fully paid, Nos. 323,966 to 383,883.

Application has been made to the Committee to allow the following to be officially quoted :—

Atlas Light and Power Co., Ltd.—£889,757 5 per cent. debenture stock.

Ericsson Telephones, Ltd.—99,980 (cumulative 7 per cent.) preference shares of £1 each fully paid, Nos. 200,001 to 299,980.

River Plate Electricity Co., Ltd.

To a net revenue of £49,249 for 1926 is added £7,318 brought forward, making £56,567. It is proposed to pay a final dividend of 8½ per cent. on the ordinary stock, making 11½ per cent. for the year, to transfer £6,555 to general reserve, and to carry forward £7,576. During the year 34,669 £1 ordinary shares were issued to shareholders as a bonus, and 1,318 shares were sold at a premium of £1,412, which has been transferred to reserve, making the latter £353,000.

Peterborough Electric Traction Co., Ltd.

The revenue during the past year increased by £7,299 to £40,536. The net profit rose from £3,508 to £5,618, and the addition of £2,203 brought forward makes £7,821 available. From this £251 is paid in staff bonuses and a dividend of 10 per cent. is paid on the ordinary shares, leaving £3,825 to be carried forward.

Midland Electric Manufacturing Co., Ltd.

The net profit for 1926 amounts to £20,010. The preference dividend is paid, £3,585 is written off preliminary expenses, £10,000 is transferred to reserve, and after paying an ordinary dividend at the rate of 7½ per cent. per annum, £4,454 is to be carried forward.

Tynemouth and District Electric Traction Co., Ltd.

The revenue for the past year was £46,563, and after meeting expenses, including £5,000 for renewals, there remains £2,840 to which is added £2,369 brought forward, making £5,209. It is proposed to pay an ordinary dividend of 5 per cent., and to carry forward £1,364.

London Electric Wire Co. & Smiths, Ltd.

Out of the profits of the past year the directors have placed £25,000 to contingency reserve, and after paying the preference dividend propose a final distribution of 6¼ per cent. on the ordinary shares, making 7½ per cent. for the year. A balance of £23,480 is carried forward.

Reduction of Capital.

C. A. Vandervell & Co., Ltd., & Reduced.—A petition for the confirmation of the special resolutions reducing the capital of this company from £350,000 to £175,000 has been presented to the High Court, and will be heard in London on April 26th.

Babcock & Wilcox, Ltd.

A final dividend of 8 per cent., free of tax, has been declared on the ordinary shares, making 13 per cent., free of tax, for the year. A similar payment was made for 1925, but 3 per cent. was included as a bonus.

Jarrow and District Electric Traction Co., Ltd.

The revenue for 1926 was £9,879, and after meeting expenses and adding £1,596 brought forward, the balance available is £1,724, which is to be carried forward.

Metropolitan-Vickers Electrical Co., Ltd.

The annual meeting was held on Tuesday last; a report of the proceedings will appear in our next issue.

German Companies.

The *Electricity Supply Co.*, Berlin, reports a successful year. Special efforts were made to extend the use of electricity in agricultural operations and for domestic use. The dividend is increased from 9 per cent. to 10 per cent.

The *Saxony Works, Light and Power Company*, reports that the degree of activity in the electrical industry was less than in 1925, and competition increased. Considerable economies were realised through the "rationalisation" of working. The dividend is 6 per cent., as in 1925.

The *Berlin Elevated and Underground Railway Company*, which increased its share capital by 62,000,000 marks to 75,240,000 marks last year for the purpose of taking over the North-South railway and the Schoneberg line, reports net profits amounting to 8,010,000 marks for 1926, as compared with 8,810,000 marks in the previous year, and the dividend is reduced from 7 per cent. to 5 per cent. The number of passengers carried increased from 163.18 millions in 1925 to 172.53 millions last year.

Correction.—The domicile of Brown, Boveri & Co., mentioned in our last issue, is Mannheim, not Baden, as stated.

Belgian Companies.

The *Société Belge pour la Fabrication des Câbles et Fils Electriques* reports that all the fixed property has been written off. The gross profits amount to 2,774,000 fr. The dividends are at the rate of 34.41 fr. per ordinary share (against 25.45 fr.), and 47.14 fr. per tenth founder's share (compared with 25.35 fr.).

The *Société de Constructions Electriques de Belgique* reports a net profit of 1,671,000 fr. for 1926, which has been carried forward. With a view to opening up markets, the report states that a considerable stock of motors was formed and many depôts were established to permit immediate delivery. The sales progressed despite keen competition. A special department has been established for export trade.

Stocks and Shares.

Monday Evening.

There is not a great deal in the present financial outlook to cause any animation in Stock Exchange markets. The continued easiness of money is an encouraging factor, and it is taken for granted in the City that the 5 per cent. Bank rate, which has been in force since December, 1925, would have been reduced, before this, to 4 per cent., had it not been for the trouble that has arisen in China. Were the Far-Eastern cloud to become dissipated, the outlook for cheaper money would be immediately brightened, and, with this in prospect, investment securities maintain a tolerably firm front notwithstanding the expectation that the Chancellor may have something unpleasant to announce in regard to Budget legislation. Any sort of tax upon income, estates, or legacies is a bear point for gilt-edged securities. Curiosity is agog to hear how the Chancellor will deal with the deficit of 36½ millions for 1926-27, and how he will provide for the nation's needs in the current year.

Electricity supply shares show a good deal of firmness, but rises in prices are mainly confined to the shares of the provincial power companies to which attention has been recently drawn here as likely to prove profitable investments from the point of view of the future. Metropolitans gained 1s. for reasons discussed a fortnight ago. Clyde Valleys are 1s. better, so are Lancashire Light & Power and Newcastle-on-Tyne ordinary. The Newcastle company reduced its dividend by 2 per cent. to 5 per cent. for 1926 as compared with 1925, but the decline was due, as the report showed, entirely to the labour conditions that ruled during last year, which can scarcely be expected to recur. The profit for 1926 of £371,700 went against £507,500 in the previous twelve months, which latter is a fairer criterion of the earning capacity of the company than is the former, and, with profits of half-a-million a year, the company can pay 7 per cent. with ease on its ordinary shares. The current price of 22s. 6d. implies that the 7 per cent. dividend is regarded as a better standard of expectation than 5 per cent., for the yield on the present basis of dividend is under 4½ per cent. on the money, whereas Lancashire Light and Power yield 5¾ per cent.

Midland Counties ordinary are in favour, the return in their case being £5 6s. 8d. per cent. on the money. The company is considered to be very well situated for the obtaining of fresh business on a large scale. Its profits last year showed an increase of £16,000 in spite of the industrial state that prevailed, and 6 per cent. was paid on the ordinary shares for the third year in succession. A new issue was made last year, the expenses in connection with which were written off in last year's accounts. The yield is sufficiently modest to imply anticipation of an increased dividend in the comparatively near future.

The strength recently shown by Underground Electric Railways of London £1 shares, and which has raised the price to 16s., has had the effect of directing somewhat specialised attention to the shares of the London tramways companies. We say specialised attention, because many people decline point blank to see any future at all for tramways, except that of the scrap heap. They maintain that investment of money in tramways shares is simply a loss to hospitals or other institutions where the money would prove of some service. On the other hand, the people who adopt the opposite viewpoint to the substantial stake that the L.C.C., to take one authority alone, has in the tramways, contending that it is impossible to imagine the L.C.C. consenting to cut such a loss as would be involved by giving up trams altogether. If the L.C.C. continues with its tramways, then the private companies may be assumed to have a sporting chance of success.

The recent endeavours, evidently quite sincere, that have been made to deal with the London transport systems and to restrict extravagant competition, are held to point to what may be expected in the future. A less haphazard method of traffic direction already prevails, and it is claimed that a purchase of ordinary shares in the London United Tramways, London & Suburban Traction, and one or two others of similar nature, will result in the speculator

doubling or trebling his money within the course of the next few years. The theory has something to recommend it, though not to the man who will only put money into a speculation on the idea that his purchase of this morning must show him a profit in the afternoon of the same day.

The Metropolitan-Vickers net profit for last year came to £179,675, a figure curiously close to the net profit in each of the two preceding years, £178,167 for 1925, and £178,808 in 1924. The price of the shares remains at 28s. 9d., at which the return on the money, on the 8 per cent. dividend, works out to £5 11s. 4d. Johnson & Phillips have weakened to 2 7/16, showing a drop of 3s. 9d. on account of pessimistic dividend forecasts. The rest of the list of manufacturing shares is steady. British Insulated have recovered to 3½. Babcock & Wilcox are unchanged, in the engineering group, at 52s. 6d. The previous dividend of 13 per cent. free of tax is repeated.

The London Electric Wire Company and Smiths made a profit of £90,900 for last year, from which the directors have taken £25,000 to place to special reserve for contingencies. The profit is about £6,600 less than that of the previous twelve months, but the dividend on the ordinary shares is maintained at 7½ per cent. The price of the 7½ per cent. cumulative preference shares is 23s. 9d., and the ordinary, which rarely change hands, stand at 26s. 9d.

In the foreign traction group, Anglo-Argentine Tramways are again better, the first preference improving to 3⅜, while the second preference retain their last week's advance at 3 5/16ths. A good many holders must now be able to secure good profits by selling at to-day's level, and, in spite of the high return which the shares offer, it might be worth the proprietor's while to sell his shares and to take advantage of the improvement that has lately occurred. Possibly the outlook is as bright as optimism declares it to be, but, in the continued state of uncertainty which surrounds the company's affairs, the acceptance of a handsome profit may be discreet.

The Montevideo Telephone Company announces to its shareholders that an offer of £2 per share has been made, by a purchaser whose name the Board does not disclose. The directors advise acceptance of what they consider to be a good price, but the uninformed proprietor naturally asks why he is not given more information. The supposition is that an American, or an American group, inspires the offer, and, if this is correct, the natural question again is: Why? As the shares were quoted not long ago in the neighbourhood of 30s., the bid of £2 looks handsome, and it piques curiosity as to the reason for this offer from someone whose identity is not disclosed. Oriental Telephones are rather easier at 52s. Chili Telephones have gone back to 6½. In the cable list the changes are of no particular consequence.

A well-known firm of Stock Exchange dealers has issued a brochure entitled "Submarine Cables and Wireless Developments, 1927," giving extracts from the report of the Mackay Companies. The intention is not to belittle the achievements or value of radio, but to allay apprehension on the part of shareholders in the cable undertakings. "Had wireless been discovered first," say the authors, "cables would have been welcomed as an improvement." The remarkable financial strength of the Eastern cable companies is set out as follows:—

Company.	Years.	*Net Profit.	To Reserve.	Ordinary Dividend 10 per cent. Free of Tax.
		£	£	£
Eastern	1922	847,248	400,000	500,000
	1925	1,044,399	500,000	
Eastern Extension	1922	724,802	250,000	400,000
	1925	851,294	450,000	
Western	1922	547,518	250,000	311,895
	1926	590,626	250,000	

*Net Profit is calculated after allowing for Income Tax, Debenture and Preference Interest.

The statement made six weeks ago by the President of the Mackay Companies is then quoted. The argument is that neither the "Beam" system nor the transatlantic telephone service is likely to have any real effect upon cable business, and this is the view consistently taken for the past twenty years by those of us who consider that there is ample room for all the various systems. The cable companies have gone steadily ahead. Marconi shareholders have suffered continual disappointments of late years, but the result of the meeting on the Tuesday in this week should prove the foundation of future prosperity. The price of Marconis remains at 17s. 6d. middle.

Brazilian Tractions are 5½ up at 137; the preferred, after touching 122, have reacted to 120½. Dollar stocks are somewhat irregular. Pennsylvania Water and Power capital stock at 188 is 4 up; Canadian General preferred is easier at 59½.

British Columbia Electric Railway stocks have given way, and, in the Home issues, British Electric Traction ordinary is 2 points down. These declines are due to the general condition of markets as a whole, and have little to do with the intrinsic values. The rubber share market is similarly affected. It is now a practical certainty that the exportable allowance of rubber allowed to companies that conform to the Stevenson Restriction scheme will be reduced to 60 per cent. on May 1st. Rubber shares remain in an uninteresting and somewhat neglected condition, the public taking no active interest at present.

Russian Electrical Notes.

(By Our Special Correspondent.)

Electrical Production.—At a recent conference of the representatives of the Leningrad works of the State Electrical Trust, it was stated that the production of all the works embodied in the Trust in 1925-26 amounted to a value of 78,548,000 roubles, an increase of 46 per cent. over the previous year. The share of the Leningrad works in the total was 45 per cent. Reductions in the cost of production were made last year to the extent of 40 per cent. in the case of lamps, 25 per cent. on apparatus, and 10 per cent. on machines.

According to the decision of the Industrial Planning Commission, the total value of production of electrical manufactures in the current year (1926-27) is estimated at 119,700,000 pre-war roubles. The output of the Heavy Electrical Engineering Trust will show an increase of 23 per cent. over the previous year, the Low-pressure Trust an advance of 55 per cent., the Accumulator Trust 20 per cent., and the Karbolite Trust 40 per cent. The demands of the market will be covered by home production to the extent of 80 per cent. The number of workmen employed in the industry will this year be increased by 9 per cent., and that of the staff by 38 per cent., while the efficiency of labour is expected to advance by 16 per cent. and the wages by 8.5 per cent. As to the capital expenditure on extensions this year, it is calculated that a total of 16,500,000 roubles will be required, of which about 44.5 per cent. will apply to the development of the construction of machines; some 51 per cent. of the total capital expenditure will be devoted to new construction and equipment. The scheme provides for the establishment of new transformer works, and works for the production of measuring apparatus and dry batteries. The Planning Commission considers it necessary for the sale prices of heavy products to be reduced by 12 per cent., those of the Low-pressure Trust by 10 per cent., and those of the Accumulator Trust by 12 per cent. It is calculated that the industry as a whole will yield a profit of 16,800,000 roubles this year, or over 11 per cent. on the turnover.

The "Elektrosil" Works.—At the end of 1923, when the question arose of allocating orders for the equipment of the hydro-electric works on the Volkhoff, which was recently brought into operation, the General Electrical Commission decided to place part of the contracts abroad and part with the Soviet works known as the Elektrosil. With great difficulty the latter succeeded in executing its allotted task in the form of two large generators, eight motor generators, and a number of transformers. Now that the contracts have been fulfilled the plant at the works is lying idle owing to the lack of further orders, the staff is being dismissed, and the experience gained is being lost. Under the circumstances it is suggested that fresh orders should be placed with the Elektrosil in connection with the projected construction in the near future of the Svir hydro-electric works, which is to afford a supply to the north-western industrial region.

The first turbo-generator (5,000 kW) has recently been completed at the works of the Elektrosil for the Ural platinum undertaking, the speed being 3,000 r.p.m. A 10,000-kW set is in progress for the Novorossisk works, and designs are being prepared for the construction of a 20,000-kW set.

The First Goods Locomotive.—The first electric locomotive built at Soviet works, constructed according to the system devised by Prof. Obraznova, has been placed in service between the Cherkizovo Okrujnoi station and the works of the former Provodnik, where the production of the State Electrical Trust is concentrated. The line passes a number of works and serves twelve undertakings.

Foreign Engineering Assistance.—In connection with the scheme for the utilisation of the falls of the Dnieper, and the proposed erection of a works of an ultimate capacity of 650,000 h.p., it is stated that the Russian Government has decided to secure the co-operation of foreign engineering firms. Besides the American firm of Cooper, with whom negotiations have already been conducted, it is said that the assistance of German works is to be obtained, as, for instance, the Siemens Bau-Union, which is to submit plans, descriptions, and offers concerning the method of construction and equipment.

The Electrical Bank.—The report for 1925-26 of the Electrical Bank states that the basis capital was increased by 71 per cent. and the turnover by 150 per cent. It is now proposed to raise the share capital by 20,000,000 roubles to 35,000,000 roubles, and to offer the new shares to all interested in electrification.

Hydro-Electric Development.—A representative of the Electric Planning Commission, referring to the projected large hydro-electric works on the Dnieper, is reported to have stated that in all probability it would be possible partly to utilise for this station the technical personnel employed on the Volkhoff constructional works. The Leningrad engineering works would also no doubt participate in the delivery of equipment for the Dnieper works as the former play a prominent part in the construction of hydraulic turbines, cables, &c.

Investigations have been concluded in connection with the construction of a hydro-electric works on the Volga, about two miles to the south of Ulyanovsk, with a capacity of 10,000 kW.

Preparations are now being made with a view to the construction of a hydro-electric works on the Svir, to have an ultimate capacity of 110,000 kW. The subject has attracted interest abroad, a Swedish turbine firm having sent in two schemes, one for three turbines of from 37,000 to 50,000 h.p. each, and one for four turbines. German firms have also asked for particulars of the contemplated works, while the British Vickers interests are said to be occupied in the preparation of estimates for high- and low-pressure equipment. Moreover, the Leningrad Metallurgical Works has presented a project for four turbines of 27,000 h.p.

The four Swedish turbo-generators are now at work at the Volkhoff hydro-electric works, which is largely assisting in affording a supply to Leningrad. The first Russian generator was started in February, and the three others will be put into operation shortly.

The Electric Planning Commission has decided that it is necessary to begin this year the construction of a hydro-electric works in Northern Georgia on the River Rione, near Kutaisa. The initial capacity is stated to be 21,000 kW in three units. The expenditure is estimated at 13,000,000 to 14,000,000 roubles. Hydro-electric works are also proposed in Carelia, Armenia, and on the Neva.

The Shteroff Station.—The first instalment of the Shteroff station, in the coal basin of the Donetz, has been completed, together with five sub-stations. One of the two 20,000-kW turbo-generators is now supplying energy to the neighbouring mines, while the other has been ordered in Germany for delivery this year. Three special furnaces have arrived from France for the consumption of pulverised coal.

A New Regional Station.—It is reported from Kharkoff that the Donetz Coal Trust and the General Electrical Commission have decided that it is necessary to construct a new regional station in the district of Stalin. Even if the extension works in connection with the existing station are fully completed the Stalin-Makevsk district, which is one of the largest in the coal basin of the Donetz, will experience a shortage of supply in 1929. The General Electrical Commission is now in search for a suitable site for the proposed new station. A second message from Kharkoff announces that the necessity has arisen for beginning this year the construction of a new station in the town of Zaporoje for the supply of the local industries and for assisting in connection with the construction of the projected Dnieper hydro-electric works.

Indian Electrical Notes.

(From Our Indian Correspondent.)

THE total provision made in the Indian Railway Budget for the year 1927-28 for the electrification of railways, is about 3¼ crores. The G.I.P. Railway alone accounts for nearly 2 crores of this amount. The projects include the electrification of the main line from Bombay to Igatpuri and Poona (costing altogether 5½ crores), for which 1 crore is provided in the Budget, and the construction of a power house at Kalyan, near Bombay, costing altogether 97½ lakhs.

The rapid success of electrification is quite evident from statistics recently published. The section between Victoria Terminus and Kurla, a distance of 9½ miles, was electrified with effect from February 5th, 1925. By January, 1927, the train mileage of the section had increased sevenfold, and passenger traffic and earnings were twenty times as great as in the period prior to February, 1925. Similarly on the Mahim Chord of the Harbour Branch Railway, which was completed on February 3rd, 1926, a comparison between the statistics of January, 1926, and those of October, 1926, shows that the train mileage increased four times, that passenger traffic was doubled, and that earnings were trebled.

Mysore Electrical Extensions.

His Highness the Yuvaraj of Mysore recently opened the newly-constructed transformer and switching station at Kankanhally, which is meant to receive and transform not merely the power now transmitted from Sivasamudram but also that which may be developed later at Krishnarajasagar and Mekadatu. The present station is well equipped and designed with special care. The essential purpose for which it has been erected is to meet the increasing demands for power from the Kolar gold mining companies and for the lighting and running of industrial concerns in Bangalore and Channapatna.

New Undertaking in Jaipur State.

The Jaipur State in Rajputana in Central India has now been equipped with a modern electric generating plant. The capacity of the power station is at present 650 kW, made up of two sets of 250 kW each and one set of 150 kW, the engines being of Messrs. Vickers-Petters' latest design, direct coupled to alternators by the Metropolitan-Vickers Electric Co., Ltd.; the generating pressure is 3,300 V. The power house building is designed not only to house the present power plant but to provide for ample extensions. It is estimated that the cost of the public supply part of this scheme is over 11 lakhs of rupees, and, in addition to this, there is likely to be an expenditure of five lakhs in the substitution of electricity for gas street lighting, &c.

A "Press" Radio Receiver.

Marconi apparatus guaranteed for aural reception of news bulletins from any long-wave continuous-wave radio-telegraph station at the extreme limit of its range.

A RADIO-TELEGRAPH receiving outfit has been designed by Marconi's Wireless Telegraph Co., Ltd., to meet the growing demand for a dependable instrument wherewith to receive the official news bulletins which are transmitted daily by the Governments concerned from numerous high-power stations all over the world.

This "Press" type Rg.12 receiver is intended to operate over a wave range of from 10,000 to 25,000 metres, and is guaranteed to intercept messages from any long-wave c.w. station at the extreme limit of its range. A feature is that it is readily tunable to any particular station with the aid of the calibration chart and instructions supplied with each instrument; the calibrated handle of each tuning circuit

A, high-frequency filters.
B, rectifier.
C, local oscillator.
D, low-frequency filters.
E, note magnifier.
F, filament resistance, fuses and switches.

Fig. 1.—The Marconi "Press" Receiver.

enables the receiver to be instantly set at the required wave-length, so that the outfit can be used by any telegraph operator, although he may be quite unskilled in wireless reception. It is not a toy, but a high-grade commercial article made for the purpose of regular long-distance reception at predetermined times each and every day with reliability.

The criterion of good apparatus is not so much its ability to receive signals, as its ability to eliminate unwanted signals from other stations which may be operating simultaneously, and disturbance caused by atmospherics and local sources of electric radiation, which interference may be many hundreds of times stronger than the wanted signals. The selectivity of the new receiver is such that two transmitting stations of equal strength, lying in the same direction, can be separated if their frequencies differ by 120 cycles per second, which means that at 10,000 metres the receiver will select between two stations only 40 m. apart, whilst at 20,000 m. it will select between two stations only 160 m. apart.

The Rg.12 outfit (fig. 1), the dimensions of which are 3 ft. 3 in. by 1 ft. $10\frac{5}{8}$ in. by 13 in. deep, incorporates five DE.5 and two DE.5B valves, and selects directively by means of a 6-ft. rectangular wooden frame aerial, on the outside of which two multi-turn coils of insulated wire are wound: three fixed condensers and a variable one are mounted on the frame for aerial-tuning purposes, and each or all of the fixed condensers can be connected across the variable one by plugs and sockets. The vertical components of the frame, which tend to partially destroy its directional properties, are balanced to enable a pure figure-of-eight polar diagram to be obtained. If on the latter the circular polar diagram (obtainable with an ordinary open aerial, which receives with uniform sensitivity from all directions) is superimposed in correct phase (with the aid of the device shown in fig. 2) a "cardioid" diagram will be obtained (fig. 3): O is the centre of reception and X X the direction in which the frame lies; the lengths of the lines O E, O F, O G from O to the periphery of the heat-shaped figure indicate the relative sensitivity of the receiver in those particular directions when the figure-of-eight diagram is superimposed on the circle diagram. It will be noticed that in the direction O F the sensitivity is increased twofold and that the angle θ of approximate zero sensitivity is represented by A O B.

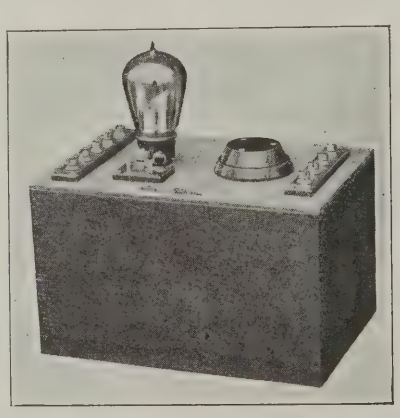

Fig. 2.—The Phasing Device.

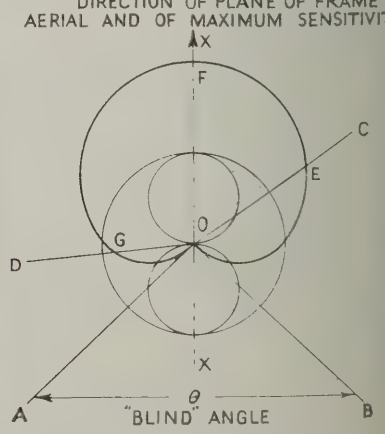

Fig. 3.—Heart-shaped Polar Diagram.

Which particular diagram is the most suitable depends upon the particular conditions prevailing at the moment of reception and can be chosen accordingly. The phasing device (fig. 2), which measures 10 in. by $6\frac{3}{4}$ in. by $7\frac{1}{8}$ in. high, consists of a single DE.5B valve, the grid of which is connected to a 35-ft. single-wire open aerial, whilst the anode circuit contains a rotatable coil inductively coupled to two fixed coils, which are connected to the frame aerial and to the receiver; a simple switch enables the valve to be switched on and off, thereby providing for heart-shaped or figure-of-eight reception respectively.

In addition, high-frequency selection is obtained by a system of three valve-coupled balanced tuning circuits of low damping; each contains a fixed inductance, three fixed condensers (any one of which can be included in the circuit by plug connectors), and a variable condenser. The first valve is coupled to the frame aerial by means of an adjustable coil; the third valve has a separate grid negative connection to enable it to be set at the rectifying point; and each circuit is enclosed in a separate screening box, the series collectively forming an efficient filter.

"Bottom bend" rectification is employed; it has an advantage over the "leaky grid" method inasmuch as it prevents strong atmospheric "paralysis" by enabling the circuits to return instantly to their normal condition. A local oscillator is embodied, consisting of a single valve with a tuning circuit comprising a fixed inductance, a fixed coupling coil, three fixed condensers with plug connectors, and a variable condenser; the circuit is enclosed in a screening box and works in conjunction with the rectifier, reducing the incoming signal to audio frequency before it is passed through two note filters designed for 1,200 cycles, which figure depends upon the difference between the frequency of the incoming signal and that generated by the local oscillator. Since a small change in the former produces a large percentage change in the latter, any incoming signal that differs slightly in wave-length from that to which the receiver is tuned will be eliminated by the note-frequency filters; the latter comprise two valve-coupled tuning circuits in separate screening boxes, one or both of which can be plugged into circuit. The single-stage note magnifier has transformer inter-valve coupling, its input being derived either from the rectifier or note filters, and it feeds low-resistance telephones through a step-down transformer.

The new receiver, other models of which are made for wave-ranges of from 4,000 to 10,000 metres and from 1,600 to 4,000 metres, is normally arranged for the aural reception of telegraphy, but can be adapted for operating a drum recorder by the addition of a Morse rectifier.

The receiver's total filament current is 1.75 A and that of the phasing device 0.25 A at 6 volts, the anodes being maintained at 120 volts with suitable grid bias. The component parts of the outfit are mounted on a vertical aluminium panel fixed to rigid framework which slides into a teak case, so that the whole can me withdrawn for inspection.

Electricity in Warships.

A survey of the applications of electricity on board British naval vessels.

By W. McCLELLAND, C.B., O.B.E., M.I.E.E.

(*Abstract of Paper read before the* Institution of Electrical Engineers.)

PROBABLY the years 1904-6, with the adoption of 220 volts, the ring-main system, and parallel running of dynamos was the beginning of modern electrical development in the British Navy. Since then the applications of electricity have advanced in variety concurrently with those on shore, and the electrical installation of a warship to-day embraces most of the modern uses of electricity. Fig. 1 shows the growth of electrical developments in warships of the British Navy from 1887 to 1920.

The conditions obtaining in warships are so severe that special specifications are necessary, not only for completed apparatus, but for materials also. This does not mean that the Admiralty cuts itself adrift from the movement towards standardisation of specifications; in fact, the opposite is the case. The Admiralty is represented on many of the electrical committees entrusted with the preparation of the specifications of the British Engineering Standards Association, as well as on similar bodies, and British standard specifications generally are applied to the utmost limit possible.

Type of System.—When the whole installation is considered, there is little to choose between the a.c. and d.c. systems on the score of weight; bad commutation is now comparatively rare, and the use of direct current for ship work is supported, therefore, not merely by argument, but also by the consensus of naval opinion of the chief powers. The system of distribution must have its highest efficiency under action conditions. The ideal arrangement of a generator of appropriate size for each watertight compartment with suitable stand-by, so as to make each compartment self-contained, would be impracticable, on account of the number of generators required; the method adopted, however, should approximate to that condition. The d.c. two-wire system is adopted by nearly all navies, except the United States Navy, which uses a three-wire d.c. system at 120/240 volts, probably adopted when difficulties were experienced in manufacturing metal-filament incandescent lamps suitable for 230/240 volts and strong enough to withstand shock and vibration. A full consideration points to the superiority of the two-wire single-pressure d.c. system with both poles insulated; a great attraction of this system is its simplicity and reliability and the comparative ease with which defects can be made good in action.

Reliability, from the naval standpoint, means usually some method of interconnection of dynamos. In certain foreign navies, what might be termed a "multiple switchboard system" is used, each dynamo having its own switchboard from which the various supplies radiate. Separate busbars on each switchboard are arranged to be connected in series, so that by means of change-over switches each board may be fed either from its own dynamo or from the other dynamos in the ship. The chief argument against this system is that the average length of cable run per point must be greater than in the ring-main system; the total weight of cable used must be greater, and the additional amount of drilling of watertight bulkheads which such a system entails is a serious drawback.

The ring-main system was first introduced into the British Navy in 1904 by the late Mr. C. H. Wordingham, C.B.E., the author's predecessor at the Admiralty. It was a bold and progressive step and, although since that date many modifications and developments of the original system have been devised, in principle the system remains the same. Main switchboards are abolished as distributing centres, every supply being taken from the ring main by a path (mostly vertical) which avoids as much drilling of bulkheads as possible. Each dynamo is connected through a supply breaker and change-over switch directly to the ring main, and the whole supply system is controlled by electrically-operated apparatus from one central control room, although local control, as an alternative, is provided. With arrangements for isolating dynamos and sections of the ring main which may become damaged in action, the system offers maximum reliability.

Machinery.—Many diverse types of electrical machinery are used in modern warships. Generating units fitted in a modern capital ship may be taken to be as follows: from 4 to 6 steam-driven dynamos of from 200 to 300 kW each, and 1 or 2 Diesel-driven dynamos of about 200 kW each. About 400 electric motors are fitted, totalling approximately 2,300 b.h.p.; individually, the powers vary from 195 b.h.p., developed by some boat-hoist motors, to 0.3 b.h.p., the output of a small ventilating fan motor.

With so many motors to be maintained, the carrying of spares becomes an important consideration, and it was partly

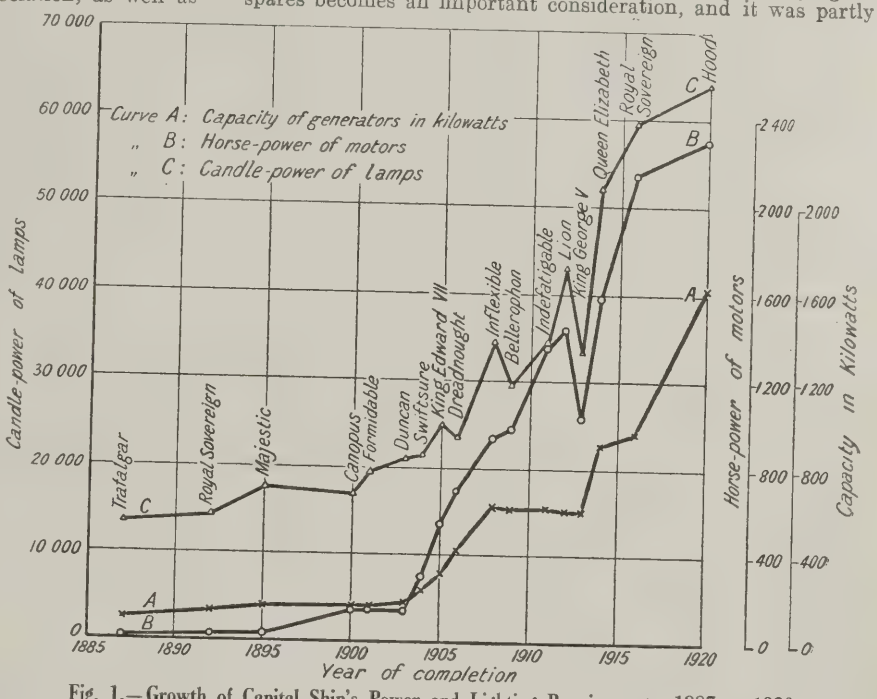

Fig. 1.—Growth of Capital Ship's Power and Lighting Requirements, 1887 to 1920.

for this reason that the British Admiralty designed ten sizes, the range of outputs being from 0.7 to 20 b.h.p. Aluminium alloys are used wherever they can be suitably employed, and special requirements are necessarily specified: bearings must permit the machine, when running, to be tilted from the horizontal through a specified angle which may be 15 deg. or 22½ deg.; special provision must be made for taking any thrust which might occur, and the larger motors are split horizontally, including the bearings when ring-lubricated. Nine standard sizes of brushes are specified, eight of which are the same as B.E.S.A. standards. The differences in the environment temperatures at various positions in the ship are considerable, and, for this reason, motors are divided into three classes, the object being to ensure that the maximum temperature of any particular motor shall not exceed an agreed figure. Totally-enclosed machines possess distinct advantages for warship purposes; various types of machines incorporating special cooling devices have been installed, and in some machines total enclosure may be used not as an end, but as a means, the transference of heat from the machine outboard being the primary consideration.

The methods adopted for motor control are similar to those in shore practice, but designs have usually to be modified very considerably for warship conditions. Electromagnetic devices are designed to hold on under shock and vibration even if the voltage is reduced by 20 per cent. Control gear must not contain inflammable material, and is arranged to break circuit on both poles. The majority of the motors are controlled by

startors, with or without shunt regulating resistances, or by controllers using series resistances or field grouping. A few automatic startors are used. For the larger motors, contactors operated by master controllers are employed. Many variable-speed motors are used in warships: the degree of control obtained with the electro-hydraulic system is very good, and an important application of this system is its use for the working of heavy gun turrets. Many of the lighter turrets have, however, been electrically operated, various methods of speed control having been used, some purely electrical and some electro-hydraulic. The latter is usually preferred by gunnery officers because of the precise control obtainable of the actual gun mechanism. In foreign navies, however, direct electric control for turret working is often employed. The Ward-Leonard system of control is applied to certain of the larger motors.

Lighting.—The head-room between decks is usually very restricted; machinery is mounted in all manner of positions, and structural obstructions are numerous. Consequently, except in a few spaces, it becomes necessary to employ a number of small and compact units, and often the positions available for the fittings do not coincide with the most desirable positions from the point of view of illumination alone. Resistance to shock is a very important problem where lamps and fittings are concerned, and manufacturers are required to supply a lamp of somewhat lower efficiency than is normal for shore use. The British Admiralty specification for lamps includes a shock test under which selected lamps, after being burnt for 50 hours, must withstand a certain number of blows. It is probable that the test will be increased in severity in view of the results of experimental work which has been proceeding, and, also, the lamps may be tested with the filaments burning, instead of cold as at present.

During the late war, a British h.c.d. (high current density) lamp was developed at one of the Royal Dockyards. The luminous power of this lamp was 6 to 10 times that of previous lamps using the same current. The carbons were bathed in methylated spirit, as in the Beck lamp, the object being to prevent oxidation of the electrodes near the tips; a pump and vaporiser had therefore to be incorporated. At the present time, both l.c.d. (low current density) and h.c.d. lamps are in use in the British Navy; the latter differ in several particulars, such as:—(1) Forced cooling and ventilation are essential, owing to the intense heat generated, and the necessity for removing from the projector the products of combustion at the arc; (2) excessive oxidation of the electrode tips is prevented by various methods, such as the methylated spirit flame, or forced-air cooling of the electrode holder; (3) special arc-striking mechanisms are used; (4) the position of the negative electrode is automatically controlled to maintain constant arc length; (5) the positive electrode is rotated to maintain the symmetrical crater formation necessary for the maximum intrinsic brilliancy; (6) automatic focal control of the positive crater is provided by various means, such as thermostatic control, or a "third electrode."

The silvered glass parabolic reflector is almost universally employed for projectors, mounted on springs in order to withstand the effects of gun shock and to cope with the temperature differences obtaining over the surface of the glass, especially with the h.c.d. lamp. When a beam of high penetrating capacity is required, it is necessary to use carbons of small diameter working at high current densities; both carbons are cored, and certain metallic salts are embodied in the positive cores. Formerly, adjustable shutters, somewhat similar to venetian blinds, were fitted outside the front glass of the projector for purposes of signalling. In modern

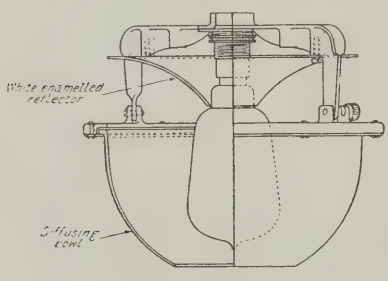

Fig. 2.—Semi-indirect Fitting for Officers' Cabins and Living Spaces.

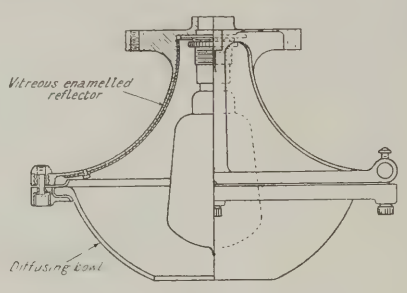

Fig. 3.—Mess Deck Pendant.

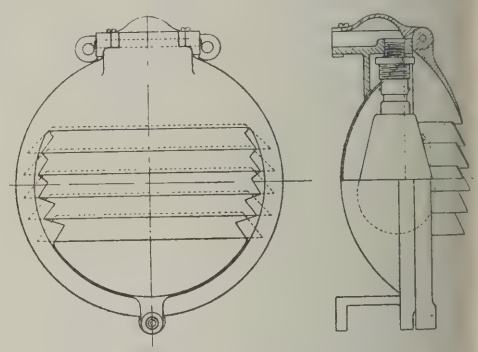

Fig. 4.—Police Light Bulkhead Fitting.

There is also the problem of screening the light source: so far as possible, fittings are designed to prevent the filament being visible at an elevation of less than 40 deg. to the horizontal, and the brightness of the luminous surfaces of the fittings within the range of vision is limited to 2.5 candles per square inch.

In order that there may be sufficient light to enable persons to move about the ship after "lights out," selected lights are fed from the "police light circuit," which is independent of the main switches in the distribution boxes. Screening may be accomplished by a suitable shade or diffusing glassware. A suitable non-brittle diffusing material of high transmission ratio which could replace glass would be of great utility for warship lighting fittings. Several typical fittings are shown in figs. 2, 3 and 4.

Magazine lighting fittings are designed to be watertight and very robust. The circuit of the lamp is automatically broken if the glass cover is accidentally smashed, or immediately the fitting is dismantled for the renewal of a lamp. A locking device makes it difficult for any unauthorised person to dismantle the fitting. The illumination of the hangars of aircraft carriers also requires special consideration, owing to the possible presence of heavy petrol vapour. For general lighting, high-candle-power gasfilled lamps are fixed overhead; there is, however, a considerable use of portable hand-lamps in these compartments, and in order to provide safety against possible explosion hand-lamps are supplied from a special 12-volt a.c. system at a frequency of 50 cycles per second. Petrol compartments and pump rooms themselves are lighted by means of external light boxes, gastight glass windows being fitted to the sides of the compartments.

In the design of fittings standardisation of parts is carried as far as the special conditions permit, so that the large variety of complete fittings may be made up from the minimum number of component parts.

Searchlights.—Such lamps are used extensively; in 1914, both automatic inclined and automatic horizontal lamps were in use, some of the projectors being arranged with electric motor-operated elevating and training gear. A short arc ($\frac{5}{8}$ in.) was used in all 80-volt ships, while in 100-volt ships the resistances were adjusted to burn the light with a longer arc (1 in. to $1\frac{1}{8}$ in.) in order to reduce the screening effect of the negative carbon. In larger warships having a 220-volt supply system, a motor-generator was fitted with each searchlight, the set being designed to give a constant current of 110 amperes over a pressure range of 58 to 62 volts; the motor-generators had automatic starters, and the arrangements permitted an arc to be started within 5 seconds from the moment of switching on.

searchlights, shutters are necessary also for completely obscuring the light for indefinite periods. Shutters of the "Iris" type (as used in cameras) have now been adopted for normal use, the former type being retained for signalling purposes only. Ventilators are fitted in all projectors, but with the h.c.d. lamp a motor-driven exhaust fan is essential to free the barrel of fumes and to equalise the temperature over the mirror. In 220-volt ships a motor-generator has hitherto been used for reducing the voltage because of its economy in comparison with a series resistance, but experience indicates that the latter may probably give better all-round service. The methods of training and elevating the projector in action introduce many intricate and confidential electrical devices and circuits. *(To be concluded.)*

Discussion in London.

Dr. C. C. Garrard, who opened the discussion by expressing his appreciation of the author's sympathetic references to the work of the late Mr. C. H. Wordingham and of the B.E.S.A., wanted to know whether the metal-mica type of switchgear insulation had really justified itself; it might show mechanical weakness when subjected to vibration. With regard to the constant-current method of supplying winches, &c., when the motor was stalled the full current continued to pass through the commutator; would that not involve a risk of burning the commutator? He hoped that experience with *H.M.S. Adventure* would change the Admiralty's opinion of electric propulsion. He understood that at the end of each trip certain transatlantic liners' mechanical gearing was subjected to examination under a magnifying glass, a significant procedure which was indicative of the reliability that might be expected of such gear in war service. Electric ship propulsion might be considered in relation to railway electrification, which was undertaken for secondary reasons and not necessarily because it was more economical than steam traction. In the case of a merchant vessel, the increased cargo space made available thereby would be a governing factor, but in the case of a warship the greatest advantage was improved flexibility and quicker manœuvring ability; he believed that on the *Adventure* operations could be carried out more quickly than had been anticipated. Because the Admiralty staff had become accustomed to operating steam valves was not a reason why electrical controllers should be made to resemble steam valves. He urged the Admiralty to make the fullest possible use of automatic control from one position, which should not be the engine room. The weakest link in the chain was the human operator.

Mr. E. C. McKinnon was of the opinion that the problem of manufacturing a reliable submarine battery had been solved, if the conditions specified in the paper were taken as the criterion. The pasted-plate type had a life of at least four years, though operating conditions were very variable: some batteries might remain idle for long periods, while others might be required to undergo a large number of charge-discharge cycles. In the American Navy submarine batteries which had been installed in 1917 and 1918 were still in service, which was a reasonable life.

Mr. W. H. Scott pointed out that the British Navy had always been in the forefront, and had set a high standard of engineering practice, which had been of much benefit to land and marine practice in general. Methods introduced to the Navy by the late Mr. C. H. Wordingham had been adopted on land and in the merchant service.

Dr. P. J. G. Jakeman thought the paper would be of value to all manufacturers, for all could do their work better when they knew what was wanted. With electric propulsion it was possible to reverse the ship's propeller (not the ship) in from 15 to 20 seconds. He supported the plea for the adoption of more automatic control, for the man in charge should not have to depend on others who might not carry out orders properly, or quick enough. In the case of the a.c. system it was the stability of the whole (*i.e.*, generators plus motors) which must be considered, not that of individual parts; when Ward-Leonard control was employed provision must be made for the absorption of surplus energy at certain times, either by means of auxiliary plant or resistances: d.c. control was simpler, and the so-called difficulties introduced by the use of a large number of brushes no longer obtained.

Mr. Rickets drew attention to the need for collaboration in research and experiment with large-scale tests, in order to avoid time-lag between theory and practical application; a few months' delay in application might have serious consequences.

Mr. A. Regnauld thought the Admiralty was right in not worrying too much about the respective merits of the geared-turbine and turbo-electric drives, because they differed little in respect of efficiency, especially as the Navy had confined itself to the use of single-reduction gearing, and had not made the mistake of trying the double-reduction type. Now that the Admiralty was employing Diesel-electric propulsion it was on surer ground; the cruising range could thereby be increased at once by 100 per cent., or, alternatively, a corresponding reduction of fuel-carrying capacity could be made. He had recently been in New York, where Lloyd's chief surveyor had told him that such trouble as had been experienced had not been due to the electrical machinery, but to the Diesel engines; their speed was a little too high for their size and operating conditions. The difficulty had apparently been overcome, for the United Fruit Co. had placed a further order in this country for another ship, a fact upon which they could congratulate themselves; her electrical gear was to be made by the B.T.-H. Co., but the engines would differ from those installed in the company's earlier vessels. The late Lord Fisher, who introduced oil fuel to the Navy, probably visualised the ultimate introduction of the internal-combustion engine for propulsion. When the torque on the shaft of a Diesel engine was considered, it became evident that mechanical gearing would have to be ruled out, and the electrical transmission system became the only reasonable one.

Mr. C. E. Vines referred historically to the introduction of the electrical helm indicator.

Mr. H. Allcock pointed out that the "bleeding" of cables in warm situations had also occurred in South African gold mines, but it could be overcome by impregnating the insulating paper before it was applied to the conductor. The author's twin flexible cable sheathed with tough rubber and reinforced with canvas might be improved by applying the canvas spirally, which would impart more flexibility to the cable. Resistance to crushing could also possibly be increased by placing a shaped cradle between the cores of the cable.

Mr. A. D. Constable explained that Navy specifications had been considered faddy and not commercial, but manufacturers were now beginning to appreciate the Admiralty's point of view. Since the late war most of its specifications had been revised. It was not realised outside the service what sort of conditions ships and their gear had to stand up to, and if Dr. Garrard interviewed the naval staff his enthusiasm for automatic control would wither; they preferred simple gear and relied on human operation.

Mr. E. T. Williams drew attention to the author's courage in breaking away from traditions of secrecy, and his attempt to present a perspective view of some of the problems encountered by the naval engineer. The author tried to co-operate with all concerned in order to obtain the best results; he had broad views about scientific advancement, but dared not make a mistake.

Mr. W. McClelland, in reply, said, with regard to insulation, that, while makers would guarantee anything, the Admiralty was unable to get consistency from them. He would like to find a substitute for mica, and the American General Electric Co. and the British Thomson-Houston Co., Ltd., were developing a synthetic resin product with very promising results. Concerning the electric propulsion of ships, he thought it was a question of high policy whether the best cruising or maximum speed should be aimed at; personally, he was of the opinion that maximum speed was the desirable thing to achieve.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

The "Mandem" Dial.

A new condenser dial, of the 4-in. diameter size, has been laced on the market by Messrs. McLeod & McLeod. The 1.55 knobbed pattern is illustrated in fig. 1; it is a high-grade

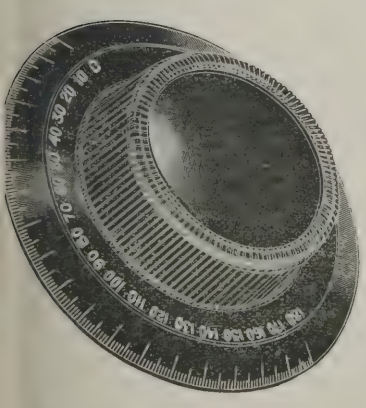

Fig. 1.—The "Mandem" Dial.

mponent of good finish, made of moulded ebonite, engraved om 0 to 180 degrees, and provided with a grub screw for tachment to a ¼-in. spindle.

Hospital Equipment.

The equipment of hospitals with wireless receivers has brought into the sick wards a much appreciated means of entertainment and recreation. The General Electric Co.,

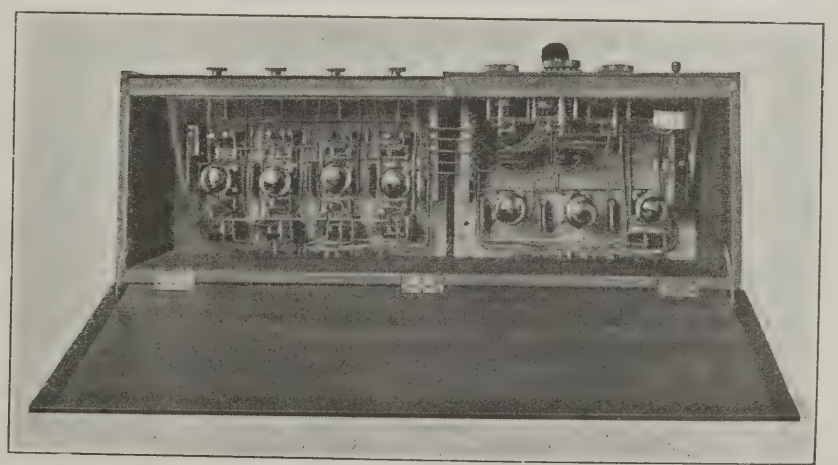

Fig. 2.—A G.E.C. Hospital Receiving Set.

Ltd., has supplied many hospitals and other institutions with wireless equipment, and the accompanying fig. 2 illustrates a set built for the Cambridge Hospital at Aldershot, to operate

approximately 400 headphones. The photograph shows clearly the neat design and compact lay-out of the receiver; in this particular case three tuned circuits were incorporated in order to cut out interference from a nearby telegraph station, which would not normally be necessary. The low-frequency amplifying portion consists of transformer-coupled stages, followed by a number of resistance-coupled single stages in parallel.

Filament Transformers for "K" Valves.

The General Electric Co., Ltd., is shortly putting on the market a transformer specially designed for use in connection with the "Osram" KL.1 valve, which has an indirectly-heated cathode. We understand that the transformer will be suitable for mains supply voltages of 200/250 at 50/100 cycles; the secondary winding will have a number of tappings by a combination of which the secondary voltage, for any number of valves up to four, will fall within such limits as will ensure that the valve is neither over-run nor under-run; this arrangement dispenses with the use of regulating resistances. The transformer will be enclosed in an iron case, the connections to the high- and low-voltage terminals being taken to terminals inside the casing.

The "R. C. Twosome" Amplifier.

It is refreshing to be reminded that crystal reception is undoubtedly advantageous in several respects. The reminder came in the form of a sample 2-valve amplifier designed by the Edison Swan Electric Co., Ltd., not to increase the range of the crystal receiving set with which it is incorporated, but to amplify the output sufficiently to enable a loud-speaker to be used. The circuit is exceedingly simple,

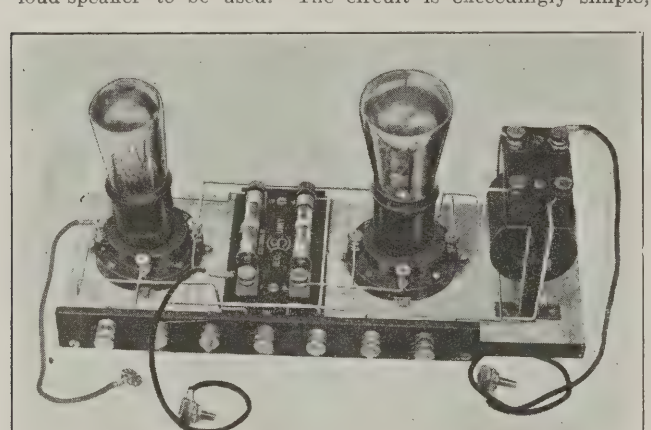

Fig. 3.—Ediswan Crystal Set Amplifier.

allowing of the set being home assembled at low cost. The crystal output is fed through a transformer, as indicated in fig. 3, to the grid and filament of an RC.2 valve, which is resistance-capacity coupled to a PV.2 power valve, both being of the 2-volt filament, 120-volt anode type, requiring 3 and 9 volts negative grid bias. The outfit is neat in appearance and workmanship, and occupies little space; the sample sent us was tried in conjunction with an "Ediswan" crystal set, and functioned quite satisfactorily.

A New B.T.-H. Valve.

The latest addition to the range of thermionic valves made by the British Thomson-Houston Co., Ltd., of which we have received samples is the B.8 type designed for resistance-capacity coupling. Its filament takes 0.12-amp. at 2.8 volts maximum, and marked diminution of results is not noticeable until the pressure is reduced below 1.8 volts. The amplification factor is 50, which large figure prompts the makers to claim that the amplification per stage can be made actually greater than that obtainable with transformer coupling. The valve is unsuitable for coupling direct to a loud-speaker: in order to utilise its great amplification factor fully, it is desirable to apply 120 volts to the anode circuit and to insert a resistance of from 2 to 5 megohms in series with the valve plate. Another feature is that if an ordinary transformer-coupled stage be replaced with a B.8 r.c. stage, the high-voltage anode consumption will be reduced to something like one-sixtieth. This valve is intended to function primarily as a l.f. amplifier or detector, but it can be used in the h.f. stage providing the set is adequately stabilised, preferably by a neutralising condenser.

New Mullard Valves.

The development of resistance-capacity coupled amplifiers having anode circuit resistances of several megohms in value has led to the design of valves specially suited to these new conditions. The impedance of the coupling being so high, the valve amplification factor can be made very high, the attendant increased valve impedance being of no consequence. The Mullard PM.1A and PM.3A valves have amplification factors of nearly 40; in consequence, if the anode circuit resistance be, say, 2 or 3 megohms, the amplification per stage should be equal to that obtained from a transformer-coupled amplifier. For reception of the local station, two PM.1A o two PM.3A valves may be followed by a 2-volt PM.2 or 4-vol PM.4. For stronger signals, the super-power PM.254 valv should be used in the last stage when using a 4-volt accumu lator. Grid leaks should be fairly high, and sufficient negativ grid bias should be used on the power amplifier.

The characteristics of the valves are as follows:—

	PM.1A.	PM.3A.
Max. filament voltage	2.0	4.0
Filament current (amp.)	0.1	0.1
Max. anode voltage	125	150
*Anode impedance (ohms)	72,000	63,000
*Amplification factor	36	35
*Mutual conductance (m/A per V)	0.5	0.55

*At anode volts=100; grid volts=zero.

It should be noted that the DP.425 and DP.625 power valve have been redesignated PM.254 and PM.256, respectively.

"Layerbilt" Batteries.

A new type of dry battery of American manufacture is now available for the heavy duty demanded by the anode circuit of neutrodyne and multi-valve radio receiving sets. Known as the "Columbia Layerbilt" No. 4486 pattern, its elements are made in the form of flat layers compressed against each other in order to actively employ all the cubic space and so reduce size. The 45-volt battery weighs 15 lb. 1 oz., and its dimensions are 8 3/16 in. in length, 7 7/16 in. in width, and 7 3/16 in in height. It is a product of the National Carbon Co. (Inc.) U.S.A.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The Easter Recess.

Replying to a recent question, the Prime Minister said tha it was hoped that the House would adjourn for the Easte Recess on April 14th until April 26th.

Private Bill.

The Farnham Gas and Electricity Bill has been read a secon time in the House of Lords.

Electricity and Agriculture.

On March 28th, during a debate on agriculture in the Hous of Commons, Sir Douglas Newton referred to the applica tion of electricity to agriculture. He said that during th passage of the Electricity Bill through the House they were told that they would be able to get a cheap and plentiful sup ply of electricity, but a situation had arisen which was not very helpful and not very hopeful as far as a cheap and plentifu supply of electricity to agricultural areas was concerned The fact that a large volume of electrical power was available on the farms enabled farmers in Germany and othe countries to use larger and more efficient machines. It was a matter of some consequence to farmers and agriculturists tha electricity should be made available to them, and steps must be taken to provide greater facilities for the erection of over head lines. Arrangements should be made for the official recog nition of standard rates of payment in connection with the pro vision of wayleaves for overhead lines and similar arrange ments for obtaining consents in a simplified and cheaper way At present the cost of an overhead line was increased by £100 or even £200, for the expense of obtaining consents and way leaves. Those difficulties were not in all cases due to land owners; the Postmaster-General himself was an offender Even when the Postmaster-General was not a first comer, he sometimes subsequently called on the undertaker who brought the current to provide protection for the Post Office wires Electrical development would continue to be retarded unti general power was given to undertakers to use overhead lines provided that they erected them in compliance with a certain standard basic specification.

On March 30th, during a debate on the need for a revival of rural industries, Mr. Fenly urged the Minister of Agricul ture to press for the application of the Electricity Act to rura areas. The Government stood self-condemned because it had not appointed one single person specifically interested in agriculture to the Electricity Board.

Broadcasting.

On March 29th, Sir W. Mitchell-Thomson informed Mr Everard that no application had been received from the British Broadcasting Corporation for permission to make any further alterations in the wave-lengths employed by its stations.

Mr. Day inquired when the regional scheme for broadcast ing on higher wave-lengths would be completed, so that lis teners would be able to obtain alternative programmes from the Daventry broadcasting station.

Sir W. Mitchell-Thomson said that the British Broadcast ing Corporation proposed to carry out experiments at Daventry at an early date, and when those had been completed they

might be in a position to submit proposals for the establishment of regional high-power stations.

Lieutenant-Commander Kenworthy asked why it was that the British Broadcasting Corporation was to receive £50,000 in revenue less this year than last year; and how many licences were in force this year as compared with last year.

Sir W. Mitchell-Thomson said that the amount paid to the British Broadcasting Company last year covered not only the revenue for the service, but also the sum required for the repayment of the company's share capital and the expense of winding up the company. The revenue of the British Broadcasting Corporation during the financial year 1927-28 would be substantially greater than the revenue of the company for the conduct of the service during the year 1926. The number of licences in force on February 28th, 1926, was about 1,906,000 and the number in force on February 28th, 1927, was about 2,235,000, in addition to about 4,400 free licences for blind persons.

Special Orders.

Special Orders have been approved in respect of the urban district of Rothbury and parts of the rural districts of Alnwick and Rothbury, Northumberland; the urban district of East Dereham, Norfolk; the urban district of Seaham Harbour and the parish of Seaham, Durham; the borough of Rye, the urban district of Battle, the rural districts of Hastings, Rye, and Battle, and the parish of Ninfield, in the rural district of Hailsham, East Sussex.

Rural Telephone Developments.

On March 31st Sir W. Mitchell-Thomson, replying to criticisms of the telephone service, said that in 1913 the rural telephone exchanges numbered 1,254. They were now nearly 2,700, and of those 1,000 had been provided at unremunerative rates. The number of those exchanges was growing at the rate of from 13 to 14 a month, and each started with an average of 12 subscribers. The number of subscribers tended to grow, and in 1925 the average number per exchange opened rose from 14.8 to 16, and in 1926 it rose to 17.3. The average initial loss on each of those exchanges was about £50 per annum. He agreed that the Post Office ought to carry an unremunerative fringe in order to provide for the expansion of the telephone service, but if the interests of the majority of telephone users were not to be prejudiced by having their rates kept at an unnecessarily high level the expenditure on the unremunerative fringe must be kept under some sort of control. Out of about 950,000 subscribers throughout the country, 88,000 were connected with rural exchanges, a proportion of 9.3 per cent. The population outside the urban districts was, however, only 20 per cent. of the whole. The Post Office was doing its best to meet the desire of farmers to have means of communication with railway stations. Nearly 100 railway stations were now provided with telephones, and about 40 more were under consideration. If the telephone service were conducted by private enterprise there would have to be either a close working agreement providing for the closest possible intercommunication between two competing systems, and a standardisation of plant and general working conditions, in which case competition would be eliminated altogether; or else a consistent and vigorous competition between the two systems, refusing all intercommunication, resulting in a restricted service, and sooner or later the disappearance of one of the systems, leaving behind a wasted or wasteful plant.

The E.D.A.-E.L.M.A. Campaign.

Discussion at Newcastle.

THE last E.D.A. Conference at Newcastle, on March 9th, discussed the E.D.A.-E.L.M.A. campaign. Mr. A. Albrecht, who presided, said that much good had been done and nuclei now existed all over the country for the furtherance of the work. Mr. Wilson (Johnson & Phillips) said that the demand had been increased by the campaign, supported by the assisted wiring schemes of the municipal authorities. There was a need for a standardised wiring system. He also thought that there was a need for "tighter" registration to secure good workmanship. Mr. Edgar (South Shields), while admitting that the campaign had done enormous educational work, considered that it had lasted too long; a shorter, more intensive, campaign would have been better. Moreover, the districts should have been consulted before the campaign was launched. He looked forward to further, improved, campaigns in the future. Mr. S. G. Pike (Newcastle Electric Supply Co.) agreed with Mr. Edgar that the Press publicity could have been improved upon if local people had been consulted first. He produced a communication which a gas company had issued to its employés asking them to do their utmost to counter the effects of the campaign. Mr. Pike suggested that the company should be asked for its views on the success of the campaign. Mr. E. L. Beck said that great courage had been shown in running a scheme of American origin in this country, and it had been done successfully. Mr. R. Kirkland thought that the campaign to a certain extent overlapped the good work which was already being done by the Newcastle Supply Co. He also agreed that the period was too long to sustain public interest. Mr. G. W. Umpleby (Newcastle Co.) gave his unqualified approval to the campaign and thought that it could be extended with advantage; he hoped that another one would be held soon. Mr. J. Coney (Siemens & English Electric Lamp Co., Ltd.) said that the campaign had undoubtedly sent up the sales of lamps and appliances. Mr. W. Horsfall (General Electric Co., Ltd.) considered that the campaign had helped the industry to withstand the strain of the past year. Mr. Adam also gave his approval to the scheme. Mr. J. H. Parker (West Hartlepool) said that valuable work had been done in getting the contractors together, and the exhibition houses had proved remarkably successful. Mr. McKenzie thought that greater success would be achieved if assisted wiring schemes were extended beyond lighting and if appliances were standardised. Mr. Evans stated that he thought the discussion was premature, for the results of the campaign were not yet known. While perhaps the period was too long for the North-East Coast, that was not true with regard to many other areas which were not so advanced. While Mr. Alderson was grateful for what had been done, he, too, thought that the campaign had lasted too long. Mr. Hibbert Smith said that the period was too long from the public point of view only; such a campaign should last six months, but the first half or more should be devoted to organising the circles, &c. Mr. Pinkney said that consideration was being given to a campaign next season, and he thought that next time the local centres would be consulted first. Mr. Heslop did not doubt that good would come from the campaign. The chairman, in concluding the discussion, said that the points mentioned would be brought to Mr. Beauchamp's attention.

The Metro-Vick Carnival.

THE annual Metro-Vick carnival was held in Manchester on April 1st. A large number of people in a brilliant variety of costumes spent a happy evening. Our illustration shows an 18th-century group who gracefully danced a minuet.

Over a thousand took part in the grand parade, and the task of the judges was a difficult one. After a careful process of elimination, prizes, distributed by Mrs. Hilton, wife of the vice-chairman, were awarded as follows:—Ladies: Prettiest costume, 1st, Miss Darwin (maintenance department), "Russian Dancer"; 2nd, Mrs. Crawford (Glasgow office), a "Fan"; 3rd, Miss Dora Bentley (M.V. Supplies, Manchester), "Dolly Sisters"; visitors' prize, Miss Hamp, "Bouquet of Roses"; most original costume, 1st, Miss Cooniham (G. Coil winding), "Sarah Gamp"; 2nd, Miss M. Brierley, "Squibs." Gentlemen: Most effective costume, 1st, G. Burness (switchgear drawing office), "Fortune Teller"; 2nd, J. Lyst (K. switchboard), "Mark of Efficiency"; 3rd, J. Brierley (K. machine), "Phantom of Opera"; visitors' prize, G. Bircumshaw, 1st, "Persian Market"; 2nd, C. Sanders, Tom Webster's "George"; most original costume, 1st, C. Booth (instrument department), "Clown"; 2nd, C. Glover (D. machine), "Buffalo Bill." The scheme of decoration was a great triumph for the Metrovick engineers. Festoons of coloured lamps arranged along the balustrade of the gallery, practically encircled the hall, and were interspersed with a dozen powerful "spot" lights of various shades, giving a charming effect. In addition, no fewer than 3,000 balloons were used and by an ingenious contrivance they were released simultaneously while the dancing was in progress. Another novel feature was an arrangement in the shape of a silver coloured champagne glass hanging from the centre of the dome. At a given signal this slowly overturned and discharged close on 2,000 inflated balloons. There were also a number of other "stunts."

18th Century Costumes at the Metro-Vick Carnival.

The National Physical Laboratory.

A Review of the Annual Report for 1926.

THE annual report of the Executive Committee of the N.P.L. on the work in hand and that accomplished during 1926 indicates that the steady progress which has marked the work of the Laboratory during the past few years was well maintained during the year under review. Notwithstanding the adverse industrial conditions which prevailed there was no material diminution in the amount of work the Laboratory was called upon to perform for firms and outside bodies; the demands made on it by the Research Boards and Committees of the Department of Scientific and Industrial Research increased, while the additional provision recently made for the more fundamental work of the Laboratory enabled satisfactory advance to be made with many problems requiring investigation. In general, the advance in the application of science to industry has created a demand for accurate measurement in a multiplicity of directions, and at the present time the resources available are barely adequate to enable the Laboratory to maintain the required lead.

A recent example of development is furnished by the application of X-rays in industry: an institute for the examination of materials by means of X-rays has been established in Berlin, and on the recommendation of the Laboratory Research Committee, approval has been given by the D.S.I.R. to the formation of a section at the Laboratory for this purpose. The work will be under the general supervision of a Committee of the D.S.I.R., with Sir William Bragg as chairman. The measurement of ultra-violet light has recently become of great importance for medical and other purposes, and experiments are in progress with a view to establishing standard methods of measuring the intensity of ultra-violet radiation.

The employment of very high voltages in the distribution of power has introduced a number of new problems in the measurement of electrical quantities, and of new requirements in respect of the knowledge and use of insulating materials. The extension of the Laboratory's activities in this direction was approved, with the support of the Electricity Commissioners, in 1923; the building for the work is complete and the equipment, to give one million volts, with an available supply of 500 h.p., will shortly be installed. The Executive Committee has appointed a special Committee to advise as to the programme of work to be undertaken in this new high-voltage laboratory. The work of the Physics Department has been greatly hampered by the inadequate accommodation, and the urgent need of a new building has been pressed repeatedly by the Committee during the past seven or eight years; it is hoped that the erection of the central block of this building will not be long delayed.

The Laboratory has important duties to perform in connection with international standardisation generally. The Commission Internationale des Poids et Mesures will hold its next meeting in Paris in September, 1927, and discussions will take place on the establishment of a suitable international thermometric scale extending to temperatures of 2,000 deg. C. and upwards. The International Illumination Commission is to hold its next meeting in America in 1928, when the difficult questions of heterochromatic photometry and the establishment of suitable standards of candle power for measurements of modern high-efficiency electric lamps will be further considered. It is proposed that meetings of the Executive Committee should be held in Italy in September, 1927, when a full meeting of the International Electrotechnical Commission is to take place. The Union Radio Scientifique Internationale will meet at Washington in 1927. A considerable programme of work is in progress at the Laboratory in connection with these international conferences; intercomparisons of the standards of resistance, voltage, candle power, and radio-frequency with those of other national laboratories are also proceeding.

Comparison shows that the total number of tests undertaken in all departments during 1926 was 609,323, being a decrease of 44,989 on the 1925 figures; in the Radiology Division the number of tests declined by 167 to a total of 134, while in the Electricity Department the number decreased by 1,175 to 2,499.

General Research.

In the Physics Department research into the heats of combustion of gases has been added to the programme during the current year, and further work has been done in the designing of simplified forms of steel mercury-vapour pumps for medium and high backing pressures. Notable progress has been made with "sound" research; the main questions dealt with have been the provision of suitable sources for the production of sounds for experimental work; methods of measuring intensity; measurement of the reflecting, absorbing and transmitting properties of materials; and examination into the acoustics of buildings is now amongst the test-work undertaken in the Sound Division.

In the Radiology Division a new form of Shearer tube has been designed and work has been continued on the determination of the optical axes of single crystals. Study of the X-ray spectral lines in copper in different chemical combinations has been commenced, and research is in progress into the variation with wave-length of the absorption coefficient of homogeneous rays, more particularly on either side of the K discontinuity of the elements of low atomic number.

Good progress has been made in the Optics Division with the development of photo-electric methods of spectrophotometry, which it is proposed to employ for the measurement of ultra-violet light; difficulty has been found in obtaining a steady source of ultra-violet radiation for experimental work, and special methods of photometry adapted for use with fluctuating sources have had to be devised.

In the Electrical Standards Division of the Electricity Department, a modified form of Kelvin double bridge for alternating-current measurements has been devised, and measurements of the impedance of thermionic valves have been made, in connection with the research into methods of measurement of amplification. An investigation is in progress into methods of precision measurement of the properties of liquid dielectrics. The horizontal force magnetometer for Abinger, Surrey, completed last year, has been erected there, and comparison with the Laboratory instrument showed very close agreement. Good progress has been made with the construction of the vertical force magnetometer; a null method is used, and a novel and ingenious device is employed for the detection of any residual magnetic field, which enables an accuracy within about 2γ to be obtained in the measurements. The investigation into the magnetic properties of alloys is being continued, in collaboration with the Metallurgy Department.

The Electrotechnics Division has been largely occupied with the study of suitable methods of measurement for use at very high voltages. The results of tests on resistance materials, extending over a considerable period, have been collected for publication, as have also those on methods of earthing electrical circuits. The study of photo-electric methods of photometry in the Photometry Division has yielded important results.

Special Investigations.

This heading comprises the work of various kinds, other than that for Government Departments, for which payment is received. It includes tests in the Radiology Division on materials of low radioactivity, such as waters and pastilles used in emanators. The work of the Standards Division of the Electricity Department has, as usual, included tests of standard coils and cells, condensers and inductances, wavemeters, &c., and magnetic tests of various materials. Assistance has been given to firms in the construction of apparatus for the total loss testing of magnetic material, and for other purposes. In the Electrotechnics Division some important researches have been undertaken for the British Electrical and Allied Industries Research Association. An investigation is being made into the different methods of measuring the power lost in the insulating material of cables for the transmission of electricity. A beginning has also been made with an investigation into the physical properties of high-voltage power transmission cables, as affected by the conditions of loading and laying. A report on the resistivity of porcelain is being revised for publication. There has been a steady flow of alternating-current test work, and a number of approval tests of meters for the Electricity Commissioners are in hand. At the request of the Commissioners the Laboratory is considering the verification of watt-hour meters designed to record a standing charge in addition to the power consumed. Standard resistances have been designed and constructed for the testing of heavy current meters as employed in connection with electrochemical processes. Test-work in the Photometry Division has included the calibration of portable photometers, measurements of the light distribution of various lighting units and tests of thermionic valves.

Sir J. E. Petavel, director, records that a number of changes in the senior staff took place during the year. Mr. Murdock retired in May, on reaching the age limit. Dr. Owen, who was in charge, under Dr. Kaye, of the Radiology Division of the Physics Department, was appointed Professor of Physics in University College, Bangor; Dr. Hanson was appointed to the Feeney Professorship of Metallurgy at Birmingham University, and a number of promotions and new appointments have been made.

A Large Electric-Sign Controller.

A machine for operating an "electric-newspaper" sign in Siam, which is believed to embody the fastest "make-and-break" contact apparatus ever devised.

A LARGE electric-sign controller which has recently been made in this country and is about to be shipped to Siam is of unusual interest in that it is claimed to embody the fastest "make and break" ever devised. It is to operate a sign of the "electric-newspaper" type consisting of a rectangular bank of lamps upon which is produced the effect of a constant stream of travelling words, and which will be used for giving news and for advertising purposes, in both English and Siamese.

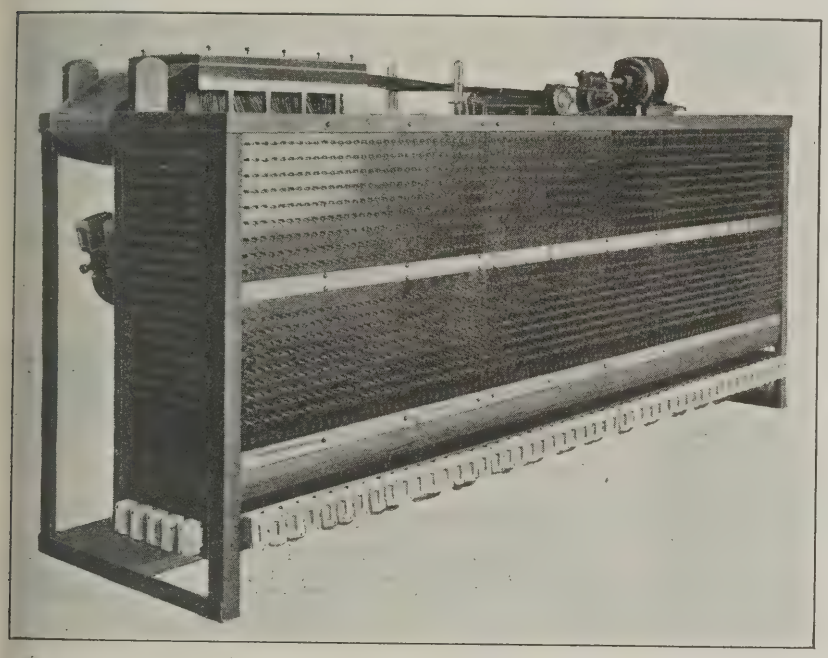

Fig. 1.—Electric-Sign Controller (Exterior).

The operating principle employed is that in which a perforated paper is passed between two identical sections of spring-operated contacts, actual connection being made at the points of, and hence in the same formation as, the perforation.

The apparatus is built up in a framework of angle-iron measuring 7 ft. 9 in. long by 2 ft. wide and 3 ft. 6 in. deep. Fig. 1 shows an external view of the controller. The panelled sides are of bakelite, and accommodate 2,340 bolt-and-nut contacts, each acting as the return or control connection for one lamp in the actual sign. The contacts are arranged in the same formation as the lamps in the sign, *i.e.*, in a rectangular block with 130 vertical and 18 horizontal rows, any one contact being connected to the corresponding lamp in the sign. Each pair of vertical rows is protected by one of the s.p. fuses shown at the base of the equipment. Leads from the contacts on the internal side of the panels, fig. 2, are taken to the lower portion of a master contactor unit mounted horizontally on the top of the controller, fig. 2 right, fixed contacts being employed for the actual connections. In conjunction with these fixed contacts there are spring-controlled ones which, with similar and corresponding devices in the top part of the unit, act as the master control of the apparatus. The contacts in the lower section of the unit are separately insulated, being built up in an ebonite slab, while those in the top portion are housed in a brass block which itself forms a common return to the whole circuit.

The perforated paper is drawn between the two sections of the control unit by means of a small rolling machine constructed on the lines of an ordinary domestic wringer. This is chain driven through a worm gearing by a small electric motor. Between the roller and the control unit the travelling paper is taut and lifts a metal rod, the ends of which run in slots in two vertical guides. In the event of the paper breaking, the rod drops and lifts a small mercury cut-out, which in turn opens a relay governing the main contactor switch. This switch, with a pair of main fuses, controls the whole apparatus and is installed at one end of the framework. Two local circuits serve the paper-driving motor and the release cut-out and relay. The equipment is designed for a maximum loading of 200 A, and will operate on 120 V, a.c., 50 cycles.

It is estimated that in normal working the contactor unit performs some two million make-and-break operations per minute, while it is claimed that the apparatus is capable of a sustained operation of ten million contacts in a similar period. Each contact point on the master unit occupies a space of about 1/50 sq. in., and the corresponding area in the sign is about 36 sq. in.

The controller is wired, internally, with single 22 C.G.S. wire threaded in sleeve insulating tubing, about 5,000 yd. of each material being used.

It is, of course, necessary, where a continual change of wording on the sign is required, to have a ready means of perforating the paper, and a suitable machine for this purpose is being dispatched with the controller. Ordinary good-quality brown paper is used. The sign will be equipped with 20-W m.f. lamps, and 350 English letters per minute will traverse it in normal operation.

The complete controller has been manufactured by the Sign Construction Co., Ltd.

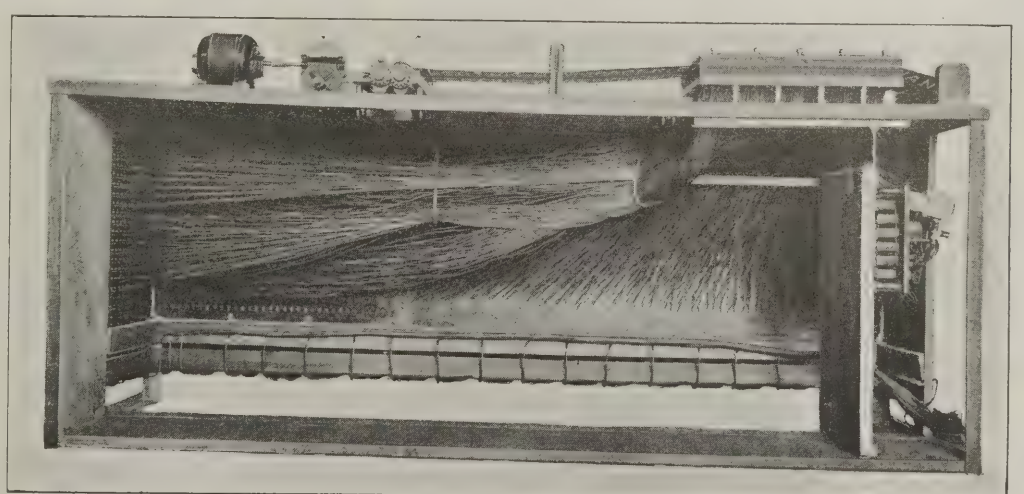

Fig. 2.—Back of Controller, showing Internal Wiring.

The Batti-Wallahs' Society.

At the annual general meeting of this Society on Tuesday, March 29th, the following officers for 1927 were elected:—President, Mr. G. W. Partridge, M.Inst.C.E.; vice-president, Mr. Walter Riggs; hon. secretary, Mr. M. Whitgift; committee: Messrs. A. E. Apps, H. Howard, H. S. Jacob, H. Tomlinson Lee, H. S. May, and G. S. Peckham.

Legal.

Imprisonment for Faraday House Secretary.

The Times reports that on March 30th, Henry William Fairman, 47, of Dulwich, was charged, on remand, at Bow Street Police Court, before Mr. Fry, with stealing £52 10s. belonging to his employers, the Electrical Standardising, Testing, and Training Institution, Ltd. (Faraday House), Southampton Row, W.C. Mr. E. B. Knight, prosecuting, said that the defendant had been in the employment of the company for 27 years, and had latterly held the position of secretary at a salary of from £550 to £600 a year. For three or four years past he had made a practice of misappropriating fees paid by students, the total sum involved being £4,500. After discovery had been made Fairman offered to make full restitution, and had already placed £4,500 in the hands of his solicitors for this purpose. He attributed his trouble to living on a higher plane than his salary warranted. Mr. Walter Frampton, for the defence, said that the whole of the money had not been accumulated, but full restitution was possible by means of wise investments. The magistrate passed a sentence of three months' imprisonment in the second division.

False Pretences Charge.

At Bolton, on April 1st, Duncan McQueen, traveller, pleaded guilty to obtaining various sums of money by false pretences. Norman Richardson, radio engineer, Burns Street, said that he advertised for a traveller, and prisoner responded. He was engaged, and he was to receive one-third of the value of the orders he obtained. Mr. Richardson found that all his orders were false, none of the persons named having given prisoner any order. The Bench imposed a fine of £10 and accepted prisoner's offer to pay at 10s. per week.

General Engineering Development Trust, Ltd.

The petition of Walter Hill & Co., Ltd., judgment creditors for an order for the compulsory liquidation of the General Engineering Development Trust, Ltd., was before Mr. Justice Romer in the Companies' Winding-up Court on March 29th, the petition having been presented in January. It was then stated that the respondent company was exploiting an electric route indicator which was applicable to tramways and 'bus services. The petition was adjourned to facilitate negotiations for raising new capital and settling the petitioners' debt. Mr. Wallington informed his Lordship that terms had been signed, and it had been agreed that the petition should be dismissed without costs. His Lordship made an order accordingly.

Electric Light Plant Dispute.

In the Chancery Division on March 31st, Mr. Justice Tomlin heard a motion by Mr. R. W. Pudsey-Dawson, of the Barn Engineering Works, Effingham, Surrey, asking for an injunction against the Effingham Estates, Ltd.

Mr. Grant, K.C., for the plaintiff, said he desired an injunction to prevent the defendants from entering certain premises which, the plaintiff said, the defendants had demised to him, and making use of the electric light plant that was there. The plaintiff negotiated for the purchase of the plant from the defendants, but nothing came of it. When the plaintiff refused them access to the plant the defendants, he alleged, made a hole in the wall and had regularly gone on to his premises and used the plant. He wanted them to take it away.

Mr. Preston, K.C., for the defendants, said there was a definite agreement to buy the plant, which, he said, the plaintiff had wrongfully repudiated. The defendants were entitled to have access to the plant and to work it.

His Lordship said that if the parties would agree to some form of undertaking in the meantime he would fix the trial of the action for the first day next sittings.

Mr. Grant, after consulting Mr. Preston, said they had agreed on an undertaking. His Lordship thereupon fixed the hearing of the action on the day stated.

The Truth About Electric Ovens.

Since the publication of our "leaderette" upon the subject of the alleged generation of ozone in electric baking ovens (March 11th), the Metropolitan-Vickers Electrical Co., Ltd., has sent us copies of two letters which it has received bearing on the matter. The first is from the chief electrical engineer of Zurich, who says that any disagreeable smell which may arise in an electric oven is due to failure to clean the appliance. The other, from M. F. Graf, consulting engineer, Baden, says that the production of ozone in electric ovens is impossible. In some of the early types the disintegration of the material in which the elements were embedded caused pastry to acquire a disagreeable taste, but this defect cannot occur in the modern types of oven.

Correspondence.

Correspondents should forward their communications **as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

The Salaries of Engineers.

Whilst agreeing with your correspondent "P.W." that the placing of electrical undertakings in the control of gas managers is not to the complete benefit of the electrical industry it is no doubt a course dictated by the desire for so-called economy. The question, however, is whether this so-called economy in management costs is not of the most expensive kind, not only to the undertaking itself, but to the electrical industry generally.

I heard some time ago of a case where a bulk supply undertaking of not the smallest dimensions was handed over to the care of the local sanitary inspector and surveyor. Not long ago I heard of a town of over 4,000 population, about to take bulk supply, where, on completion of the scheme, it is to be handed over to the supreme care of a local tradesman as part-time job, as if the undertaking were a kind of voluntary fire brigade.

This is the kind of thing for which some public bodies want severely trouncing, and then guiding in the way they should go.

But for this kind of thing (not forgetting, of course, the general overcrowding at present so evident), perhaps there would be less of a scramble for the £2-a-week jobs to which your correspondent referred—with a consequent improvement in the salaries of those engineers whose qualifications entitle them to a reasonable protection from the labour profiteer.

Hopeful.

March 26th, 1927.

Electrical Engineers in the Navy.

Perhaps you or some of the numerous readers of the Review could advise me as to the conditions obtaining in H.M. Navy for electrical engineers, *i.e.*, general conditions, terms of service, &c., and if it is really worth trying for experience; and also where to send application for joining.

Anxious.

March 28th, 1927.

The Irish Free State Electricity Supply Bill.

The Government Bill is meeting with determined opposition from two powerful interests. On the one hand there are the local authorities, companies and individuals, statutory or otherwise, who have carried out schemes, and on the other the electrical contractors acting through their Association.

The management and organisation of the Shannon work follow naturally on the Act of 1925, but as the present Bill now stands the Government claims arbitrary powers over all existing undertakings, even to the point of confiscation.

At the inception of the scheme it was understood that electricity was to be supplied in bulk to all existing undertakers at a cheaper rate than they could produce it by themselves, and that the body to be put in control was not to engage in distribution except in such areas as had not already made provision for supply. With reference to the existing undertakings it was clearly stated by the Government's experts in their report: "It should be remarked that the State supply and the development of the Shannon scheme will by no means involve the dismantling of the organisation existing in these towns (the larger and medium-sized towns) with the exception, perhaps, of a small portion of the operating staff." It is now sought to obtain powers enabling the Electricity Board to offer an authorised or statutory undertaker a bulk supply at a rate equal to, or less than, the cost of generation by the undertaker, and if he does not want to take it he can be made to do so. The whole thing is cleverly shaped under Clause 20, which provides that up to 1932 the Board may charge an uneconomic or nominal price for bulk supply. This means the end of all existing undertakings, private or municipal. When they are wiped out the Government comes into its own, for after 1932 the Shannon scheme must be firmly established as a paying concern, and such prices or rates as have hitherto been made for bulk supply must be increased to make it so. It is all very simple.

The Irish Section of the Electrical Contractors' Association may be depended upon to put up a good fight against Clauses 47 and 48. These clauses give the Electricity Board powers separately or in conjunction with authorised undertakers, to open shops and showrooms, and to sell fittings, apparatus, and appliances for heating, lighting, power, and all other purposes for which electricity could, or might, be used, and also to undertake the wiring of private houses. This may, or may not, mollify to some extent the confiscated undertakers at the expense of the contractors, but it can scarcely be expected that the contractors are prepared to go out of existence in order to make things easy for the Government. They do, however, appreciate the joke as quite racy of the soil, but unlike the consulting engineers who have had no practice for the last three years, they want something more to keep them alive and hearty. As one of the unemployed consultants said to the writer the other day: "This is the Government

which, like Moses, was going to lead us by the hand into he Promised l and, or at least those fortunate ones who were live at all when they gave us leave to suck our sustenance rom the Shannon after they had done with it themselves."

P. T. White.

Rostrevor, *April 1st*, 1927.

Faults in Flexibles.

Mr. J. W. Meares's letter in your issue of to-day calls for a eply.

We recommend "Feraflex" flexible cord with steel auxiary conductors and asbestos separator as a general-purpose exible cord, particularly for electrical heating appliances.

For vacuum cleaners, however, the "Anti Shock" flexible specially recommended, as it is important for a flexible cord r such purposes as vacuum cleaners that the insulation rotecting the conductors should be mechanically and electrilly sound. Hence our recommendation of "Anti Shock" exible cord for vacuum cleaners.

The "Anti Shock" flexible cord is made up with the insuted conductors embedded in a jacketing of flexible rubber, id over the rubber jacketing there is a stout polished yarn raiding.

We would like to take this opportunity of thanking Mr. W. Meares for his appreciation of our "Anti Shock" exible.

Ward & Goldstone, Ltd.
(M. H. Goldstone.)

Manchester, *April 1st*, 1927.

Published Specifications.

mpiled expressly for this journal by a firm of Chartered Patent Agents. e numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1925.

2,560. "Metallic mirrors within electroionic discharge tubes." Edison an Electric Co., Ltd. September 9th, 1924. (239,861.)

2,744. "Wireless and other electrical apparatus." Paragon Rubber Manufturing Co., Ltd., and G. W. Croot. September 11th, 1925. (267,172.)

4,914. "Electric accumulators for hand lamps." C. R. Fowler and M. Roberts. October 6th, 1925. (267,175.)

5,699. "Electric telegraphic systems." H. V. Higgitt and Eastern Teleph Co., Ltd. October 14th, 1925. (267,180.)

7,664. "Telephone systems." Standard Telephones & Cables, Ltd. (B. A. rkhud and F. de Fremery). November 3rd, 1925. (267,181.)

0,172. "Electrical oscillatory circuits such as those employed in wireless egraphy." K. E. Edgeworth. November 30th, 1925. (267,196.)

0,581. "Wireless receiving apparatus." A. H. Midgley. December 3rd, 5. (Cognate application 211/26.) (267,198.)

0,583. "Electric contact springs and the operation thereof." Siemens os. & Co., Ltd., and W. E. Goodwin. December 3rd, 1925. (267,199.)

0,845. "Electric accumulators." H. Leitner. December 7th, 1925. 7,205.)

0,997. "Method of and apparatus for the production or generation of nds or tones." M. J. Goldberg & Sohne Ges. December 8th, 1924. 4,133.)

1,165. "Control of rotary convertors." A. Reyrolle & Co., Ltd., Mather Platt, Ltd., R. E. Grime and B. H. Leeson. December 10th, 1925. 7,217.)

1,195. "Automatic and semi-automatic telephone systems." Standard lephones & Cables, Ltd., and G. C. Hartley. December 10th, 1925. 7,220.)

1,363. "Wireless receivers of the superheterodyne type." L. Levy. ember 12th, 1924. (244,484.)

1,572. "Method of treating, and an electric furnace for the treatment of, onaceous material." J. J. Naugle. December 14th, 1925. (267,240.)

1,579. "Magnetic vibratory devices." Standard Telephones & Cables, , and H. J. Gowring. December 15th, 1925. (267,243.)

1,386. "Control of electrically-operated railway points." P. E. Carter R. Connell. December 22nd, 1925. (267,249.)

1,898. "Brush-holders for dynamo-electric machines." Bruce Peebles and Ltd., and F. G. Brookhouse. December 30th, 1925. (267,252.)

1926.

6. "Containers for electrical apparatus." Metropolitan-Vickers Elecl Co., Ltd. January 16th, 1925. (246,131.)

4. "Automatic control devices for electric arc-welding apparatus and r purposes." W. R. Hume. January 11th, 1926. (267,256.)

5. "Horns for wireless receiving sets, gramophones, and other musical ruments." S. F. McCord. June 18th, 1926. (267,258.)

442. "Electric signalling devices." H. Karabetz. January 19th, 1925. 179.)

752. "Wireless electric signalling systems." H. Wade (Naamlooze nootschap Philips' Gloeilampenfabrieken). February 9th, 1926. (267,279.)

356. "Brakes of tramcars and like vehicles." A. W. Maley. February 1926. (267,280.)

473. "Oil-immersed electric transformers." Bruce Peebles & Co., Ltd., J. W. Rodger. February 12th, 1926. (267,284.)

775. "High-frequency power supply for electric induction furnaces." C. nz Akt. Ges. February 18th, 1926. (247,949.)

781. "Electric motor control systems." Express Lift Co., Ltd., and . Meacock. February 15th, 1926. (267,289.)

1,881. "Circuits of train-lighting and similar installations and switches for controlling the said circuits." J. Stone & Co., Ltd., and A. H. er. February 19th, 1926. (267,294.)

904. "Magneto electric machines." J. Lucas, Ltd., and E. O. Turner. h 9th, 1926. (267,304.)

92. "Electromotors." Aircraft Patents, Ltd., and G. H. Cooke. March 1926. (267,310.)

7,045. "Manufacture of substantially non-sagging coiled filaments from highly refractory metal." H. Wade (Naamlooze Vennootschap Philips' Gloeilampenfabrieken). March 13th, 1926. (267,312.)

8,615. "Variable electric condensers and the like." R. Atkins and Ormond Engineering Co., Ltd. March 30th, 1926. (267,334.)

9,540. "Foundation for "A" and "H" poles supporting telegraph, telephone, and electric power wires." J. E. Rutter. April 12th, 1926. (267,340.)

10,226. "Sound-receiving devices for submarine signalling." Walker Signal and Equipment Corporation. April 25th, 1925. (251,269.)

11,108. "Driving arrangements for electrically-driven vehicles." J. Buchli. February 12th, 1926. (265,911.)

11,322. "Electrically heated lighters for smokers." E. W. Puckert. April 20th, 1926. (267,349.)

11,669. "Electro-magnetic clocks." M. P. Favre-Bulle. May 3rd, 1926. (267,351.)

14,143. "Artificial line for use in cross-talk calibration in telephony." Felten & Guilleaume-Carlswerk Akt. Ges. November 12th, 1925. (261,338.)

16,158. "Variable self-inductances." Compagnie pour la Fabrication des Compteurs et Matériel d'Usines à Gaz. June 29th, 1925. (254,338.)

16,376. "Electrically-driven rail vehicles." J. Buchli. June 29th, 1926. (Addition to 265,911.) (267,376.)

16,595. "Transmission and reproduction of views, scenes, or images by wires or wirelessly." J. L. Baird. September 1st, 1925. (Divided application on 266,564.) (267,378.)

18,735. "Apparatus for the treatment of organisms with electrical current." W. T. Arnberg. July 29th, 1925. (256,236.)

18,847. "Train-control systems." Automatic Telephone Manufacturing Co., Ltd., and A. E. Hudd. December 9th, 1925. (Divided application on 266,485.) (267,388.)

19,507. "Separate drive for the axles of electric motor vehicles." Maschinenfabrik Oerlikon. July 9th, 1926. (267,393.)

19,746. "Voltage or current regulators." International General Electric Co., Inc. August 10th, 1925. (256,652.)

20,171. "Electromagnetic circuit interrupters or switches." Metropolitan-Vickers Electrical Co., Ltd. August 5th, 1925. (257,594.)

20,320. "Impedance measuring bridges." Standard Telephones & Cables, Ltd. (Western Electric Co., Inc.). August 17th, 1926. (267,397.)

20,605. "Electric cells." G. Weissmann. November 30th, 1925. (262,049.)

21,794. "Vapour-discharge valves, mercury-vapour rectifiers, and the like discharge devices." Siemens & Halske Akt. Ges. September 3rd, 1925. (257,951.)

22,621. "Coil sockets for electric cables." Siemens-Schuckertwerke Ges. September 15th, 1925. (258,583.)

23,941. "Hollow cables for electric overhead lines." Siemens Schuckertwerke Ges. February 4th, 1926. (265,544.)

24,370. "Electric switching arrangements for use with the lighting systems of motor-cars." K. M. Chapman and G. E. Chapman. October 3rd, 1925. (259,239.)

24,450. "Alternating-current rectifiers." C. Lorenz Akt. Ges. October 2nd, 1925. (259,243.)

24,723. "Lighting fixtures." Korrectolite Co., Inc. July 15th, 1925. (Divided application on 252,353.) (259,256.)

24,724. "Lighting fixtures." Korrectolite Co., Inc. July 15th, 1925. (Divided application on 252,353.) (259,257.)

25,282. "Cooling apparatus for electric transformers." O. Happel. October 11th, 1926. (267,418.)

26,672. "Projecting lamps." G. H. Cushing. November 5th, 1925. (260,976.)

26,870. "Controllers for electric motors." International General Electric Co., Inc. October 27th, 1925. (260,598.)

27,017. "Electric incandescent lamps." British Thomson-Houston Co., Ltd. October 29th, 1925. (260,607.)

29,500. "Manufacture of electric incandescent lamps." General Electric Co., Ltd. May 1st, 1926. (267,438.)

30,291. "Holders for tubular electric lamps." H. Friedeberg. November 30th, 1926. (Addition to 262,424.) (267,442.)

30,434. "Pinion gear, especially for electrical vehicles with separate axle drive." Maschinenfabrik Oerlikon. December 4th, 1925. (262,434.)

Trade Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from March 30th :—

Snake Head (design only). No. 472,068. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—Hydrawerk Elektricitats Gesellschaft, Charlottenburg, Berlin, Germany. (British representatives: Boult, Wade & Tennant, 112, Hatton Garden, E.C.1.)

Carlton Battery (lettering and design). No. 473,039. Class 8. Electric pocket, hand lamp and torch batteries, batteries for radio-telegraphy, and dry cells.—E. Fischbach, trading as A. Finnie & Co., 13, Carlton Place, Glasgow.

T.S.F. (lettering and design). No. 477,762. Class 8. Instruments and apparatus and parts thereof for use in radio-telephony and telegraphy.—T.S.F., Ltd., 10, Duke Street, Adelphi, W.C.2.

Saco. No. 476,049. Class 13. Electric fuses.—Sykes & Dyson, Ltd., Queen's Mill Road, Huddersfield.

3 Spires (lettering and design). No. 476,183. Class 13. Transmission chains of ordinary metal.—Coventry Chain Co., Ltd.

Bird (design only). No. 473,988. Class 14. Platinum-pointed screws for magnetos.—R. J. Dingley, trading as W. H. Reynolds & Co., 11, Key Hill Drive, Birmingham.

Sotonite. No. 473,203. Class 40. Copper wire covered with india-rubber or gutta-percha or with compounds of these.—Pirelli General Cable Works, Ltd.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

ABERGELE.—Children's Sanatorium for Manchester Corporation Public Health Committee; City Architect, Town Hall, Manchester.

ARDEER.—School extensions, with electrical work, for Ayrshire E.C.; William Reid, master of works, Education Offices, Ayr.

ASHFORD (Kent).—Additional 60 houses, Beaver, for the U.D.C.; W. Terrill, surveyor, 5, North Street.

AYR.—Extension to bakery (£1,800), for W. C. Galbraith and Sons, 80, High Street; the manager.

BACUP.—Roman Catholic Church, Stacksteads; Mullen and Durkin, builders, Burnley.

BARNSTAPLE.—Extensions, High Street, for the *North Devon Journal*; Friend & Kelly, architects, Boutport Street.

BEXHILL.—Houses, Collington Lane, Little Common Lane, and Sutherland Avenue; J. E. Maynard, Collington Avenue. 36 houses, Burnt House Farm; borough engineer.

BEXLEY (Kent).—Additional 64 houses, for the U.D.C.; surveyor.

BLACKPOOL.—Hydro, Harrowside, for Town Council; borough surveyor.

BOURNEMOUTH.—Wesleyan Church, Alma Road (£5,000); Jones & Seward, builders.

BRADFORD.—Extensions to St. James' public abattoirs (£50,000); city architect, Town Hall.

BRAMPTON (Cumberland).—Housing scheme (33), for the Brampton Public Utility Society, Ltd.; secretary.

BURSLEM.—Electric heating, St. Joseph's Catholic Church; trustees.

CANADA (Ottawa).—Extensions to the Chateau Laurier Hotel ($2,000,000), Canadian National Railway; Government Offices, Wellington Street (first section, $500,000).

CHELMSFORD.—Reservoirs and waterworks (£60,000); borough engineer and W. & C. French.

COLWYN BAY.—Science block class and social rooms, Penrhos College; J. M. Porter & Co., architects, the estate office.

COULSDON AND PURLEY.—Fire station, &c., for the U.D.C.; Nicholls & Hughes, architects, 4, Raymond Buildings, London, W.C.

DONCASTER.—Warehouse, for the Co-operative Society; T. H. Johnson, architect, 20, Priory Place.

DUNSTABLE.—Church, Luton Road, for the Wesleyan trustees.

EDINBURGH.—New Home for the Blind (£10,000); Managers, Royal Blind Asylum and School.

ENFIELD.—Railway sidings, L.N.E.R.

FLEET (Hants.).—Telephone exchange; office of works.

GUILDFORD.—School, Stoke Hill (£14,200), for the borough E.C.; the clerk.

GUISELEY.—Housing scheme (75), Hawkshead Estate; M. Rennard, clerk to U.D.C.

HEMSWORTH (Yorks.).—Palais de danse, for Fred Partridge; Reginald Goodworth, architect, 5, Market Hill, Barnsley.

IRISH FREE STATE (Bray, Co. Wicklow).—81 houses for the U.D.C.; E. M. Murphy, surveyor to Council, 27, Molesworth Street, Dublin.

(Dublin).—Reconstruction of Butt Bridge, and a further new bridge (£300,000); Port and Docks Board.

(Fethard, Co. Tipperary).—Rebuilding Tullemaine Castle (electric lighting), for Major Morel; J. Hearne & Son, builders, Waterford.

KINGSTON-ON-THAMES.—Additional 58 houses, for the T.C.; borough surveyor. Extensions, Tiffin Boys' School (£42,000); Governors.

KINGSWOOD (Bristol).—Re-erection of portion of motor-cycle works, for Douglas Bros., Ltd. (£100,000); W. H. E. Millman, managing director.

LANARK.—Garage, showrooms, shops and arcade, Bannatyne Street; proprietor of the Caledonian Garage.

LONDON (Barking, E.).—Additional housing schemes (337), Upney Estate, for the U.D.C.; housing architect. Workshop and garages, Ripple Road; H. & J. Alleston. 28 houses, Buller Road; E. Glenny & Son.

(Becontree, E.)—Church, Becontree Avenue; Essex Baptist Association. 30 shops and houses, Becontree Avenue; W. White.

(Bethnal Green, E.).—44 tenements, Brady Street; Rowley Bros., Ltd., Tottenham, for L.C.C.

(Ilford, E.).—26 houses, Albemarle Gardens, and 9 shops, Victoria Parade; Suburban Developments, Ltd. Congregational Church, Broomhill Lane; G. Baines & Son. Elementary School, Redbridge; Education Committee.

(Stepney, E.).—154 flats, New Gravel Lane; borough engineer.

(Finsbury, N.).—Extensions, Technical College; Central Foundation Managers.

(Greenwich, S.E.).—Additional 80 houses, Charlton Park, for the T.C.; borough surveyor.

(Lewisham, S.E.).—1,266 houses, Downham Estate; Holland, Hannen & Cubitts, for L.C.C.

(Southwark, S.E.).—Reconstruction premises in Stamford Street.—Messrs. J. Sainsbury, Ltd.

(Hammersmith, S.W.).—Reconstruction, St. Hubert's School, for L.C.C.; Triggs & Co.

LONG SUTTON (Lincs.).—Secondary School, for Holland E.C.; director of education, Spalding.

MALDEN.—Conversion of workhouse into mental hospital: Harbrow, Ltd., for Middlesex C.C.

MERSHAM.—Development, Mersham Manor Estate, R. H. and R. W. Clutton.

MERTON.—Elementary School, Merton Abbey; Burges and Son, for Surrey Education Committee.

MILNROW.—Housing scheme (30), Bridges Road, Newhey; A. Travis, architect, Union Bank Chambers, Rochdale.

MITCHAM.—Secondary School for Girls; Surrey Education Committee.

MORECAMBE.—Church, West End Road; Secretary, Christian Scientist Society.

NEWCASTLE-ON-TYNE.—School of Mines, Armstrong College, for the governors.

NEW MALDEN.—Factory near Burlington Road; Modern Homes & Estates, Ltd., of Motspur Park.

NEWPORT (Isle of Wight).—Club premises, High Street, for the Conservative Club; A. E. Marvin, Carisbrooke.

NEWPORT (Mon.).—Gwent Cathedral (£500,000), for Monmouth Diocesan Conference; Dr. Howell Green, Bishop.

NORTON.—Elementary School, West Riding Education Committee.

PEWSEY (Wilts.).—Housing scheme (40), for the R.D.C.; Walter F. Bickford, architect.

RICHMOND-ON-TEES.—Garage (£8,000), Catterick Camp, for the Motor Delivery Co., Grange Road, Darlington; G. Dougill & Sons, builders, Darlington.

RUGELEY (Staffs.).—Works extensions, Keystone Road, for J. Key & Sons.

SELSDON (Surrey).—50 houses, Garden Village; Richard Costain & Sons.

SOUTHEND-ON-SEA.—St. Margaret's Church, Leigh; Graham Lloyd, architect.

STACKSTEADS (Lancs.).—Roman Catholic Presbytery; Mullin & Durkin, builders, Burnley.

SWADLINCOTE.—Garage for 50 'buses, for the Midland Red Motor Services; traffic manager, Bearwood, Birmingham.

SWILLINGTON (Yorks.).—School, for West Riding E.C.; director of education, County Hall, Wakefield.

TADCASTER.—Nurses' Home, Board of Guardians.

THETFORD (Suffolk).—Hospital (£6,500), for the hospital committee; Mr. Boardman, architect.

THORNE.—New buildings for Grammar School; West Riding Education Committee.

TYNEMOUTH.—New pavilions, isolation hospital, Balkwell; borough engineer.

UPPER WARLINGHAM (Surrey).—Nurses' Home (56 beds), Mental Hospital, for Croydon T.C.; H. Carter Pegg, architect, 35, Parliament Street, London, S.W.

UXBRIDGE.—Garage and petrol store, Cowley Road; Anglo-American Oil Co., Ltd.

WINCHESTER.—Additional 40 houses, Stanmore, for the T.C.; borough surveyor.

The

Electrical Review

VOL. C. APRIL 15, 1927. No. 2,577.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Points from two Speeches.

A FEW weeks ago we were enabled to publish the collective and official view of the B.E.A.M.A. regarding the position of the electrical and allied industries. We need not now recount the various factors which influenced the course of manufacturing and trading operations during a most exceptional year. In the main the influences played havoc with all departments of industry, while some, including certain domestic sections of the electrical trade, derived a measure of advantage. On the whole, everybody felt that the electrical industry had come out of a disastrous period in a gratifying and creditable manner, but most people also felt that, though a bad year had passed away, its consequences would show themselves painfully in the first half year of 1927 as industrial and other concerns issued their reports and profit and loss accounts.

During the past fortnight or so several large electrical manufacturing companies have announced their results, and chairmen have made their explanatory statements, expressed their views on remedies that would bring relief where trouble presses, and ventured forecasts of the future course of trade.

We do not know that the individual statements differ materially from those of the collective organisation where they relate to the situation as a whole, but while an associated report reflects, we suppose, an averaged opinion, discounting extreme views of individual concerns, the separate reports of different companies have a particular interest of their own. In the privacy of the board room as well as in the publicity of an annual meeting with one's shareholders, the experiences of a single business afford the text, and deductions and forecasts are made, and optimism or the reverse is indulged in, according to what has been happening or is expected to happen to that particular undertaking.

The statement made by Mr. P. J. Pybus, as chairman of the English Electric Company, Limited, appeared in our last issue, and it is followed this week by our report of Sir Philip Nash's speech at the annual

meeting of the Metropolitan-Vickers Electrical Co. Both speakers referred to the dislocation of industry due to the year's upheaval, and both had something to say on the subject of competition. Mr. Pybus remarked that manufacturers of heavy electrical plant in their laudable efforts to defeat the foreigner, too often found themselves defeating each other in the race for extra output as a corrective for too low prices. "Competition in the heavy electrical industry had been carried to a point of wastefulness, and it was from the national point of view a costly rivalry." He expressed the hope that the general recognition of that fact would lead to some arrangement being made "by which the destructive internecine competition between all the principal companies engaged in the heavy trade for foreign work could be reduced." An increase of 3 per cent. in selling prices for export would change entirely the result of a year's trading and put the heavy business on to a reasonably sound footing. A large export trade was essential in order that they might fill their works and cover their overhead charges.

Perhaps in due course information may emerge regarding the kind of arrangement that can be made to reduce the internal competition for foreign heavy contracts without playing into the hands of foreign competitors at a time when, as Col. Morcom remarked in his B.E.A.M.A. speech, the electrical export industry is on the eve of an intense struggle with these rival producers who are designing to dominate the world markets.

Mr. Pybus, notwithstanding all the difficulties referred to in his speech, expressed confidence with regard to the future. The world's productive capacity is still largely in excess of demand. As purchasing power improves the overdue increase in demand will, in his opinion, bring a fair world selling price. The company's works, it was stated, were never in better shape. We hope that the long-awaited revival of big plant and equipment orders will bring such advantage to the various English Electric works that the chairman will have a more congenial duty to perform next year.

The speech of Sir Philip Nash was of a more optimistic order. His company is not limited to heavy plant production—it covers a very much wider field offering larger scope. The gratifying profit result which enables a good dividend to be paid and an only slightly reduced output reported for a year like 1926, could hardly justify a mood of depression. The company obtained nearly as much business (value) in the home market in 1926 as in 1925, and it considerably increased its business (in terms of tonnage) obtained in the overseas markets. Export orders received were far in excess of any previous year, but Sir Philip again had to admit that the prices obtained for export work had been barely remunerative. He mentioned with pride, however, that their export successes in such a year as 1926 were an indication of ability to compete with the other great electrical plant manufacturers of the world in overseas markets. With regard to the outlook, the speaker was not enthusiastic in his reference to the home market, because it does not seem likely, in the near future, to provide as much business as he had hoped it would do. Industry generally is not recovering from the effects of the coal strike as quickly as had been anticipated, but conditions may be expected gradually to improve "so that later in the year this market may regain its former activity." We may hope that as the Central Electricity Board is making headway with its work, schemes will speedily be proceeded with which will give the needed stimulus to the heavier section of the industry. Sir Philip Nash finds that the export market offers promise, but competition in the home market is severe.

A point which is troubling all concerns engaged in competitive production is the ever-increasing burden of rates and taxes, and here the foreigner is, of course, at an unfair advantage. This serious matter has been emphasised in Government quarters, and it needs to be driven home more and more among municipalities which are tempted to place plant and other contracts abroad.

Industrial France.

Although her population remains far more agricultural than industrial, France is an outstanding example of the change brought about in Europe by the war. The forced speeding-up of mechanical industry, and the acquisition of further important sources of raw materials, have combined to place France in the front rank of industrial nations.

As a consequence, she is now able to meet her home requirements fully in many directions and still have a surplus for export. In other directions the expansion of exports has been rapid, and a substantial share of the world trade has been obtained. For example, in the electrical material branch, while imports remained practically stationary between 1913 and 1925, the exports rose from 10,200 to 20,200 tons (in 1924 they were 23,600 tons). The balance in France's favour thus rose from 2,600 tons in 1913 to 12,400 tons in 1925.

The home demand has been stimulated by generous State aid, both in the electrification of rural districts and in water-power and other development. The report by Mr. J. R. Cahill, reviewed in this issue, attributes partly to this strong home demand the fall in exports from 23,600 tons in 1924 to 20,200 tons in 1925.

It would appear that while their home market makes French manufacturers to a great extent independent of the export trade, it also enables them to compete on better terms in foreign markets. It is to be hoped that our own home demand will so grow in the near future as to put our firms in the same enviable position.

Fostering Overseas Trade.

While it may be admitted that the present State organisation could profitably be cut down, some discrimination must be exercised in the application of the axe. The mere saving of expenditure does not always mean a gain to the country, and one of the last departments which should be attacked at the present time is that charged with the care of Overseas Trade. It was, therefore, a rather thoughtless suggestion which was made in the House of Lords recently, that the D.O.T. should be abolished as a measure of economy, and Mr. Dunwoody, secretary of the Association of British Chambers of Commerce, has our support in his condemnation of the proposal. If any alteration is desirable it is in the direction of improving and strengthening the department—not getting rid of it. We should be glad to see it occupying as important a position here as the United States Department of Commerce does in relation to that country's foreign trade. A recent statement averred that this organisation was responsible for increasing America's overseas trade in 1925, by £110,000,000; the annual cost of the organisation is £600,000. A department which gives such results is worth keeping, but it must be given sufficient scope, and not just tolerated.

Oil-driven Generating Stations.

The question whether very large power stations at a distance from their load can compete on an economic basis with power stations of small or moderate size, situated close to the consumers' premises, is one which cannot be answered offhand—the Weir Report notwithstanding.

On the following pages we give a description of the 1,200-kW, oil-driven plant at Ashford, the adoption of which was sanctioned by the Electricity Commissioners in view of the fact that the cost of energy in bulk from an economical generating station less than 20 miles away would have been far more than that of the locally generated supply, owing, we believe, to the capital charges on the transmission line.

We do not suggest that this particular instance affords a solution to the general problem, but it certainly indicates that the day of the small power station is not over; and if, as is probable, cheap British oil becomes available from the low-temperature distillation of coal, its position will be greatly strengthened.

Electricity Supply at Ashford.

A recently inaugurated municipal electricity supply undertaking, with an alternating-current 1,200-kW oil-driven generating station, to which 500 consumers were connected in four months, resulting in a maximum load of 250 kW.

ASHFORD, an important market town situated in the Weald of Kent, is the centre of an agricultural district with a population of 15,000.

Many years ago the Urban District Council obtained a Provisional Order to supply electricity, but nothing was done, and the Order, after being transferred to a company, lapsed without any scheme being put in hand. In 1923, public demand induced the Council to take up the matter again, and a firm of consulting engineers was engaged to submit a report. At this stage the question of obtaining a bulk supply from a neighbouring town was considered, but, after negotiations, the Electricity Commission notified the Ashford Council that it would be advisable for it to install its own plant. As a result, a small direct-current scheme was put forward, principally for lighting. The Council, however, decided that the scheme was of insufficient capacity to supply electricity for industrial purposes, and the matter again lapsed until early in 1924, when the Council advertised for an engineer to prepare a scheme and, subject to its approval, to become the Council's electrical engineer. As a result, Mr. H. Wilson (distribution engineer at Paisley, and previously of Croydon and Maidstone) was appointed, and from July, 1924, the town's electricity scheme has been controlled by a small committee of the Council, in conjunction with its engineer. The Special Order, as finally sanctioned by Parliament in December, 1925, included the urban and West Ashford rural districts, and, the bolder policy of catering for the future rather than the present having prevailed, it was decided to generate 3-phase alternating current at 6,600 volts, 50 periods, and to distribute from transformers at 400 and 230 volts on a 3-phase, 4-wire system.

The choice of a prime mover being in favour of crude-oil solid-injection engines of the Diesel type, three 400-kW sets were finally decided on, and armoured cables were laid direct in the ground and fed from transformer kiosks having a comparatively small radius of approximately 500 yd., *i.e.*, 1,000 yd. between kiosks; as a result, no cable of more than 0.1 sq. in. conductor section has been installed.

The site of the generating station consists of 2½ acres between the main Southern Railway line and the River Stour, on which work was commenced in February, 1926. A 4-in. pipe line 130 yd. in length conveys fuel oil from a previously existing siding to a motor-driven pump in the engine room, delivering at the rate of 600 g.p.h. through an oil meter into either of two storage tanks of a combined capacity of 200 tons; the steel-plate tanks, supplied by Messrs. Braithwaite, Ltd., are enclosed by a brick wall 4 ft. 6 in. high, and the same pump can be used to convey oil from them to an 800-gallon tank situated in the engine room, from which the oil passes, either direct or through a De Laval purifier, into a second 800-gallon tank, and thence to the engine service tanks. In any case, a centrifugal purifier was required to deal with the lubricating oil, and a 250-g.p.h. set was installed; all the fuel oil used is also passed through it.

From the engine service tanks of 100-gallon capacity, fitted with water-heated coils, the oil passes to three

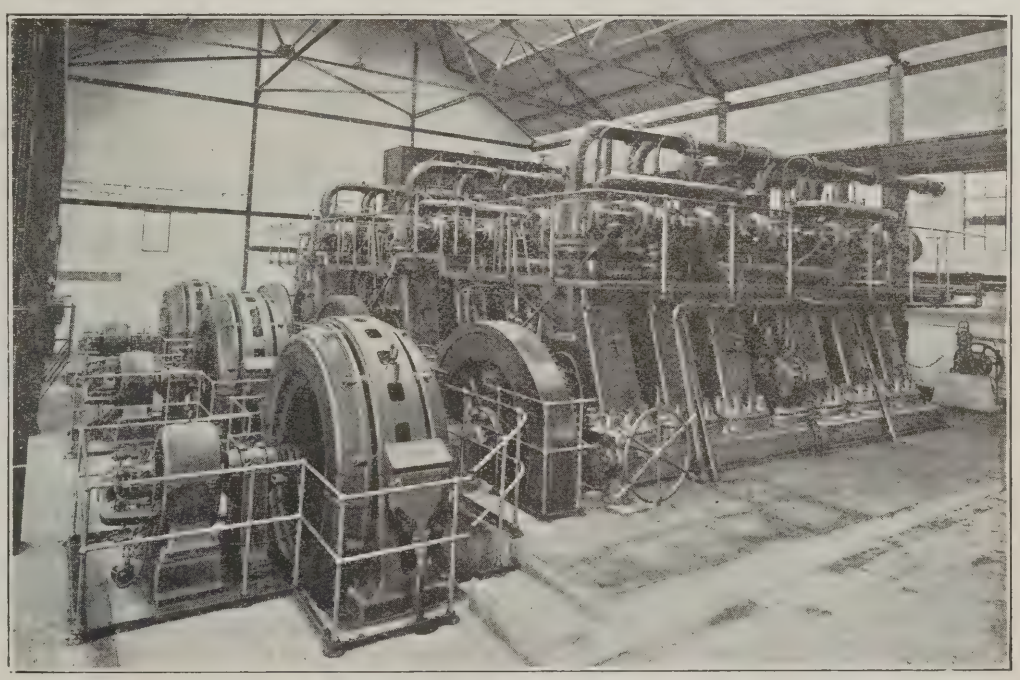

Fig. 1.—Diesel-electric Generating Plant.

Ruston & Hornsby 600-b.h.p. solid-injection oil engines (fig. 1) of the six-cylinder open type, each developing 600 b.h.p. at 250 r.p.m.; it is injected on the Ruston mechanical system, and a distributor is used in conjunction with two pumps so connected that they are controlled by one governor.

Directly coupled with the engines are three 400-kW alternators, supplied by the English Electric Co., each having its own exciter on a shaft extension. The "English Electric" e.h.p. truck-type switchboard (fig. 2) has eight panels: three for the alternators; three for outgoing feeders; one for a station transformer, which also supplies the low-voltage network; and one for splitting the busbars so that access may be obtained to any part without depriving the town of its supply.

The cooling-water system consists of a concrete pond

(fig. 3) of an area of 900 sq. yd. and a depth of 2 ft.; two motor-driven Gwynne centrifugal pumps deliver water to an overhead tank, and thence by means of a 4-in. ring main to the three engines; each of the pumps is capable of delivering 18,000 g.p.h. to the tank, which figure corresponds to 10 gallons per b.h.p.-hour with the three engines on full load. Arrangements have been made for pumping water direct into the ring main if it should be necessary to empty the overhead tank, and a 3-in. town main runs to a float valve in the overhead tank to form an automatic

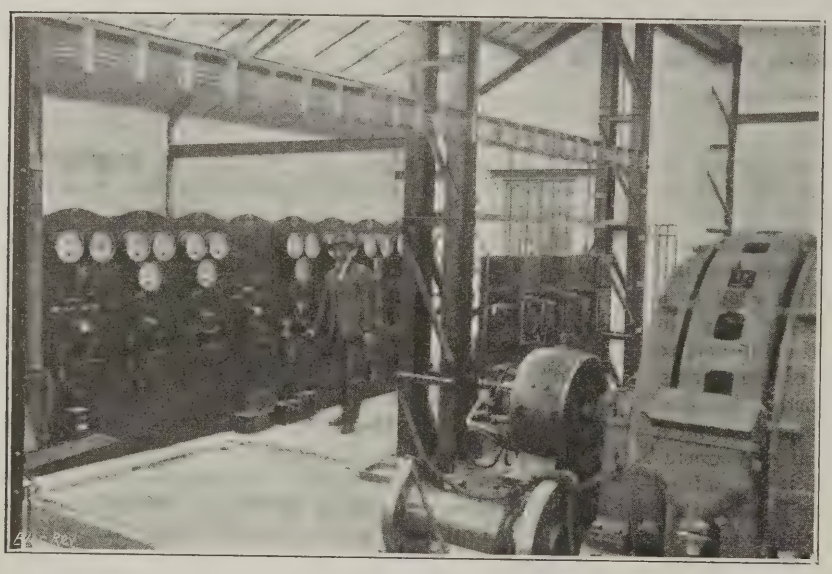

Fig. 2.—Truck-type 6,600-V Switchboard.

stand-by supply and for use when it is necessary to empty the pond for cleaning purposes.

A hand-operated 10-ton Morris travelling crane spans the engine room, which is a steel structure with brick filling and a glass and asbestos slate roof, in which no combustible material has been used.

Two six-roomed houses have been provided for the occupation of the engine-room and mains foremen, and are, of course, "all-electric," except the hot-water supply, which is provided by a boiler through which the exhaust from any, or all, of the three engines may be passed, or by-passed, by means of dampers. The boiler also supplies hot water for heating the fuel and lubricating oil before centrifuging, and gives an ample supply for all purposes. Compressed air is only required for starting the engines, and four bottles are charged either by a motor-driven compressor or by a paraffin engine-driven compressor.

Offices and stores are situated on a corner of the site, and telephone communication has been provided.

The distribution system consists of a 6,600-V ring main near the outer circumference of the town, approximately 7,000 yards in length, on which are situated six transforming points, consisting of sheet-steel cubicles supplied by the New Switchgear Construction Co., Ltd., each having an ultimate capacity of 250 kW and a spare e.h.p. way for future extension. The e.h.p. ring main is of 0.1 sq. in. conductor section, and a branch cable of the same size is taken into the Southern Railway Co.'s carriage works to feed a 500-kW Hewittic mercury rectifier which the Company has installed to operate in conjunction with its own direct-current plant.

The transformer kiosks have been placed in close proximity to possible power users in the town, so that such customers can be supplied by independent cables direct from the kiosks, the transformers at the same time feeding into the low-voltage network, which is made up of 4-core, 0.1-sq. in. paper-insulated, lead-sheathed, steel-tape-armoured cable laid direct in the ground under the footpaths. All high-voltage cables are wire armoured, so that they are readily distinguishable with a view to preventing accident. The neutral conductor of all the l.p. cables is of a cross section equal to that of the phase conductors, as it is anticipated that considerable out-of-balance currents may have to be dealt with in connection with probable domestic loads. No underground disconnecting boxes have been used, but distribution pillars (supplied by Messrs. Lucy & Co., of Oxford) have been installed at convenient points between the kiosks.

Provision for half-night street lighting has been made throughout the whole system, and a separate conductor has been provided for this purpose. All-night lighting in the main thoroughfares has been provided for by a second conductor, and all street lighting will be controlled from the works through a relay system where necessary. The half-night lighting conductor has been carried into such premises as may require a supply for sign illumination, and a special rate of £1 per 30-watt lamp per annum is quoted for this purpose.

Cast-lead service boxes with wiped joints have been used throughout the whole system, and careful attention has been given to armour bonding. The whole of the cable has been supplied by Callender's Cable and Construction Co., Ltd., and was laid by direct labour under the supervision of the Council's engineer.

The supply became available on November 1st, 1926, and by the end of February, 1927, approximately 500 customers had been connected, resulting in a maximum load of 250 kW. At an early date a supply is to be given to two flour mills and to the Southern Railway Co.'s carriage works, so that quite a good day load is anticipated. The Council is quoting very low rates to large consumers and, as there is a good deal of vacant land with

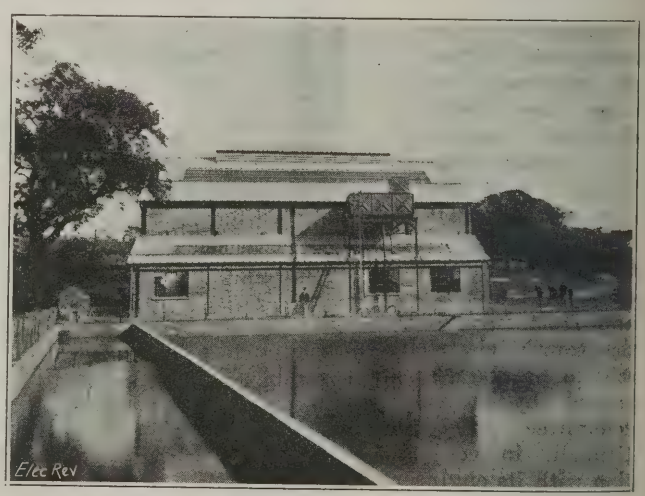

Fig. 3.—Power Station and Cooling Pond.

excellent transport facilities, it is hoped that cheap electricity will attract new industries to the district.

The annual capital charges per kW of peak load which the station can deal with, including stand-by plant, and including land and building, but excluding distribution, amount to £4. Fuel oil consumption per kWh generated will probably come out at 0.8 lb., costing 0.36d., and lubricating oil at 0.025d.; wages at 0.12d., repairs and maintenance at 0.06d., making a total running cost of 0.565d.

It is estimated that in the summer of 1929 an extension will be required to meet the autumn load of that year, and an interesting problem will then arise as to the form which the extension should take, and the alternative question of bulk supply. The figures to make bulk supply an economical proposition will probably be in the neighbourhood of £3 10s. per kW and 0.4d. per kWh.

Power Transformer Operation.

The author describes and compares the various systems at present in use, or available for use, for the protection of electrical apparatus in their application specifically to power transformers, including two recent introductions by the British Thomson-Houston Co., Ltd., and Messrs. Johnson & Phillips, Ltd.

By D. W. McJANNET.

IT is intended in this article to summarise the various forms of protection as applied to static power transformers. Many excellent papers have been presented on the general subject of protection, but very few have dealt with the subject as applied specifically to this important apparatus.

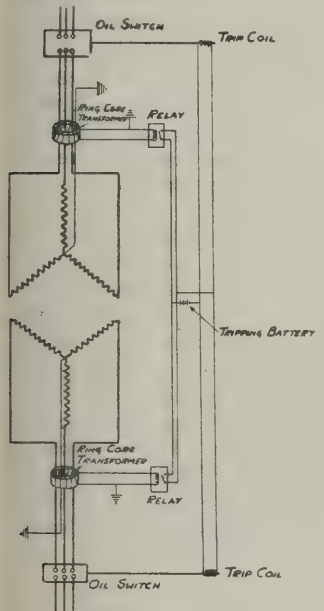

Fig. 1.—Core-Balancing Protection.

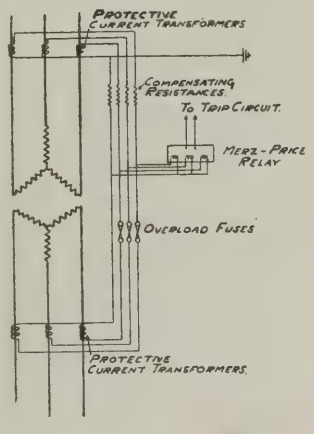

Fig. 2.—M.P. System, Star-Star Transformer.

The subject of protection from mechanical damage due to short-circuiting is one that demands attention in the design of the transformer. This usually takes the form of special bracing of the winding in a radial direction, and automatic or hand-operated axial coil supports are provided to take up any shrinkage which may occur in an axial direction. Radial coil supports are not necessary, and are generally regarded as being a source of danger rather than safety. As a further precaution, the reactance should be kept as high as possible, in order to keep down the value of the short-circuit current, the actual value depending on the output of the transformer, its position on the system, and the reactance of the rest of the circuit. The following table shows the average values of reactance usually put forward for standard designs of apparatus, but these can be increased or decreased slightly without materially varying the other values of the transformer.

For small transformers on overhead lines overload protection is usually carried out by means of fuses, either of the expulsion type or the more simple form consisting of fuse wire connected across horn breaks. For protection against high-frequency impulses it is usual to insert an air-core choke coil. The type of choke coil usually supplied often fails to smooth out the front of the wave before it reaches the transformer winding, and in this connection it is usual to reinforce the insulation between the turns for about 5 per cent. of the winding; but where the transformer is to be installed in a climate where atmospheric disturbances are frequent and severe, it is then sometimes necessary to insulate all the turns on the primary side for full-line pressure between the turns. In connection with the protection of transformers connected to overhead lines, a good deal of work has been carried out in Germany and America on choke coils and condensers used in conjunction with resistances. A particularly interesting paper on this subject by Mr. S. A. Stigant will be found in the J.I.E. *Journal* for June, 1922. This deals very fully with wave shape and the protection of transformer windings against the effect of high-frequency disturbances.

Transformer kVA.		Percentage Reactance. 50 cycles.	40 cycles.	25 cycles.
500	...	4.0	4.5	5.0
1,000	...	5.0	5.5	6.0
1,500	...	5.5	6.0	6.75
2,000	...	6.0	6.5	7.5
3,000	...	6.75	7.0	8.5
4,000	...	7.5	8.0	9.5
6,000	...	8.5	9.0	10.5
10,000	...	10.0	10.5	12.0

It is very desirable that there should be no possibility of the l.p. side of a transformer becoming charged at a higher pressure than normal, due to the breakdown of the insulation between the h.p. and l.p. windings.

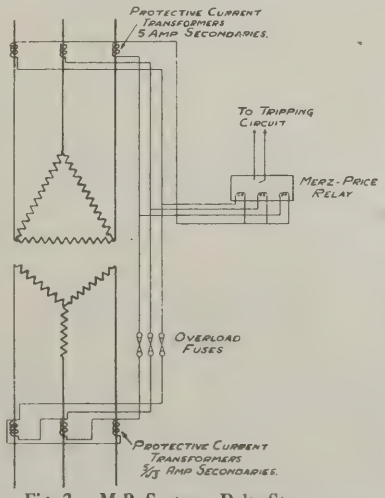

Fig. 3.—M.P. System, Delta-Star Transformer.

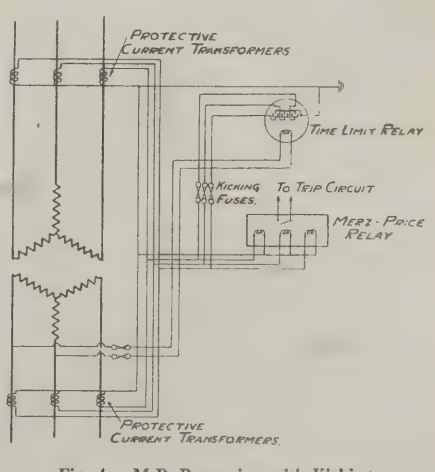

Fig. 4.—M.P. Protection with Kicking Fuses and Relay.

An early form of protection against this type of fault was the introduction of a split copper-sheath between the two windings, but insulated from them, the ends of the sheath being earthed. It was found, however, that this earth shield was in the nature of an added danger rather than a protection, as the inclusion of such a

shield tended to weaken the insulation between the windings, and unless special care was taken, the two ends of the shield came into contact and formed a short-circuited turn. Another disadvantage, which is probably not so well known, is the blanketing effect which this shield has on the inside winding. An earthing device is now more commonly employed connected to the l.p. neutral point, so that should the pressure rise in the secondary winding, a paper or other insulating disk

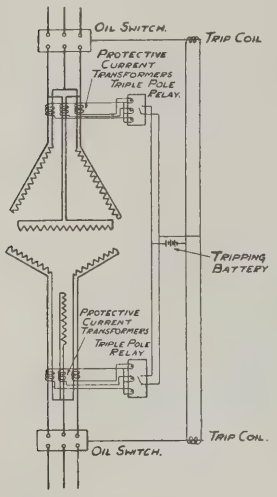

Fig. 5.—Self-Balancing Protection.

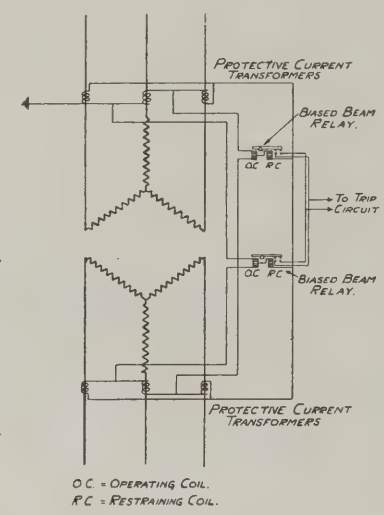

Fig. 6.—McColl System.

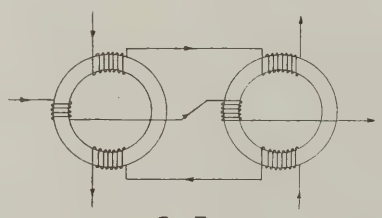
is punctured, thus connecting the l.p. neutral to earth. In the case of single-phase transformers, the mid-point of the secondary can be brought out and earthed through the device. Possibly the best protection from this type of fault is the earthing of the neutral direct, especially in the case of isolated units. Where transformers situated at some distance from one another are operating in parallel on both the h.p. and l.p. sides, it would only be permissible to earth one neutral positively on account of the possible circulation of third-harmonic currents. The other neutral point could conveniently be earthed through a suitable device.

For small transformer units in isolated positions, plain overload protection only is usually employed. This can be improved upon by the inclusion of leakage protection and time-limit fuses on the overload trips. A.c. tripping is usually employed, the trip coils being connected direct to the secondaries of the current transformers. Where two or more transformers are operating in parallel, plain overload protection should never be employed. If all the transformers are operating at full-load and one develops a fault which trips it out of commission, the remaining transformers will then be sharing the load of the faulty transformer, which may be sufficient to operate their trip coils, thus shutting down the whole bank of transformers.

Another simple form of protection is that provided by the core-balancing system, although this method is limited in its application and gives protection against earth faults only. The diagram in fig. 1 shows a three-phase star/star transformer protected by this method. The main leads on each side are taken through the opening of a ring transformer, the secondary of which is connected to a relay operating the tripping circuit. In order that the transformer shall not be switched out by a distributor fault, the earth connection from the neutral point should also be taken through the core of the protective current transformer. When this is done, current will flow in one direction only, in the event of an earth fault on the transformer, thus disturbing the balance and thereby operating the relay. The relays will operate with a fault on either the h.p. or l.p. windings. It is not, however, always permissible to earth the h.p. neutral, or that may not be available, but where circumstances permit, this system can very easily be installed on existing plant without any alteration to the transformer connections.

The Merz-Price circulating-current system is probably the most popular of all the protective systems at present in use. It gives protection against faults to earth and between phases, and is entirely discriminating. The principle of the system depends on the equality of currents flowing in and out of a sound circuit. Where a transformer is introduced, the currents in the primary and secondary are equal in a mathematical sense, but they can be directly compared by suitably arranging the ratio of the primary and secondary protective current transformers. The connections for the application to a star/star connected transformer are shown in fig. 2 and for a delta/star transformer in fig. 3. It will be noticed that in the case of the delta/star-connected transformer the current transformer secondaries are connected in delta on the star side and star on the delta side. This is necessary to compensate for the phase displacements between the line currents on the primary and secondary sides, and, in addition, it is necessary to make the ratio of the current transformers on the delta side X to $5\sqrt{3}$, so as to obtain 5 A in the secondary leads at full load. It is often impossible to take tappings off the secondary leads at points of equal potential, and in such cases compensating resistances can be inserted, enabling the tappings to the relay to be made at convenient points. By the insertion of suitable fuses in the secondary leads, overload protection can also be obtained with this system. In the case of a heavy overload these fuses will blow, causing the relay to operate. Where adjusting tappings are fitted on the main transformer, it is necessary to make provision for keeping the current-transformer secondaries balanced under normal conditions, whatever tappings may be used on the main transformer. This could be done by means of compensating resistances, or suitable tappings could be provided on the current-transformer secondaries, so that, should the h.p. current increase, due to working on a lower-voltage tapping, the current-transformer secondary currents would still be 5 A at full load under working conditions.



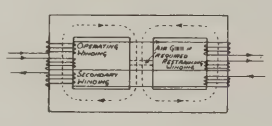


Fig. 7.

Figs. 7 and 8.—B.T.-H. Biasing Transformers.

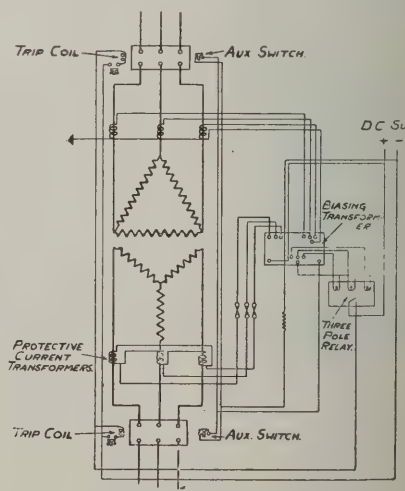

Fig. 9.—Circulating-Current Protection.

When switching in transformers there is often a heavy rush of current in the primary which does not appear in the secondary, and there is therefore a danger of this gear operating when switching on, with no fault existing. To prevent this happening, the relays are shunted by so-called "kicking fuses," usually set to "blow" at 75 per cent. overload. These cause the relay settings to be coarse, and it is advisable to provide some arrangement whereby the fuses are only in circuit during the switching-in period, and are automatically

removed when the circuit breaker has been closed for a predetermined time. This can be carried out by means of an additional relay, as shown in fig. 4. When the oil switch is closed, this device comes into operation, and the plunger commences to rise against an air dash-pot. At the end of a fixed time-setting the plunger reaches the point at which the contacts, dipping in mercury cups, are raised, thus cutting out the fuses. When the switch is tripped, the relay resets itself and the fuses are again in circuit. The only disadvantage of the switching-on protection is that the coil is always on load, and should it burn out the fuses would still be in circuit without the switch tripping. The Merz-Price system can be easily installed on existing transformer plant without making any alterations to the transformers.

Many of the disadvantages of the Merz-Price system are overcome in the self-balancing system, which provides against short-circuits between phases or earth faults, but not against short-circuits between the turns. The system is based on the comparison of currents entering and leaving the windings, separate protection being provided for both h.p. and l.p. sides. Current transformers are required for each winding to be protected, and these each have two primary windings in series with the incoming and outgoing leads to the transformer windings. The secondaries of the current transformers are connected to relay elements operating the tripping circuits, the connections for a delta/star transformer being as shown in fig. 5. Under normal conditions the currents in the two

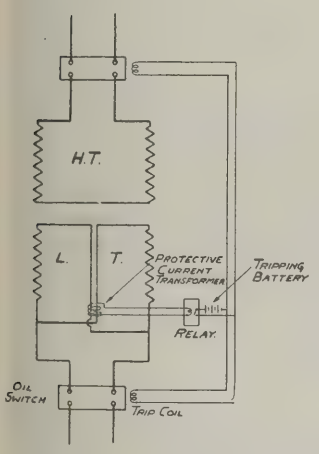

Fig. 10.—J. & P. System for Between-turn Faults.

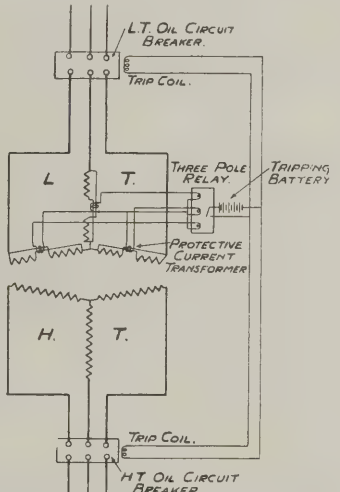

Fig. 11.—J. & P. System, Three-phase.

primaries are equal and opposite, so that no flux is produced in the core of the current transformers. When a fault occurs, current will enter through one primary winding and pass to earth, or another phase, without returning through the other primary winding, thus producing a flux in the current-transformer core, and causing operation of the relay and oil switch. The system is very sensitive, and under normal conditions no p.d. exists between the different parts of the secondary winding, thus minimising the risk of accidental operation. This risk is further reduced by the absence of pilot wires between the current transformer secondaries. As the h.p. and l.p. sides are treated independently, the system is proof against switching-on current rushes, and the presence of tappings on the main transformer does not introduce complications. It is a very simple system for all cases involving phase relationships or voltage variations. As the current transformers are inherently self-balanced, there is no danger of operation on heavy overloads due to unbalancing in the current transformers. It is difficult to install this gear on existing plants, as both ends of each phase of the power transformer must be available, but for new transformers it presents no difficulties. If the protective gear is ordered with the plant, the current transformers can be accommodated in the tank and the connections suitably arranged.

The McColl circulating-current method of protection is really an improvement on the Merz-Price system. The relays used are of the biased-beam type, one coil having a restraining effect. There are two main reasons for the instability of the Merz-Price system, namely, the faulty choice of equipotential points and the possibility of the current transformers developing different characteristics when the induction density reaches a high value; and as the unbalancing effect cannot be accurately calculated, it is necessary to make the relay-setting high to ensure stability. The McColl system, by the use of the biased relays, overcomes this objection. The restraining coil carries the main current of the system, the other coil being connected to equipotential points. If a 10 per cent. bias is required, it is necessary to wind the restraining coil with approximately 10 per cent. of the turns used for the operating coil. The relay will then be held in the off position until the unbalanced current flowing through the operating coil has a value equal to 10 per cent. of the current traversing the restraining coil. At this value the ampere turns of the two coils will balance one another. With such an arrangement it is possible to give a definite guarantee of stability, as ample latitude for unbalancing may be allowed. Fig. 6 shows the arrangement applied to a star/star transformer, two relays only being necessary. With delta/star connection the protective current transformers have to be connected in delta on the star side, the secondaries being arranged for $5/\sqrt{3}$ A as in the Merz-Price protection. The system has much to recommend it, as it is quite sensitive without the relays being in any way delicate. They will therefore stand up to any rough handling which they are likely to receive. As regards its installation, the system offers no difficulties beyond those of the ordinary Merz-Price equipment.

A further means of providing bias has been developed by the British Thomson-Houston Co., Ltd. This does not involve the use of special relays, but depends for its action on a special biasing transformer. A simple method of restraining the relay from operation is provided if, instead of introducing additional forces in opposition to the operating effect, a reduction in the magnitude of the latter be brought about. What is required is some intermediate device connecting the operating apparatus and the relay, capable of transmitting to the latter such an amount of the available energy as may be appropriate to the circumstances under which the apparatus is functioning. To meet these conditions a specially designed transformer has been produced. It is provided with a primary or operating winding, a secondary winding, and a further winding known as a restraining winding. This is not inductively related to the operating and secondary windings, but it excites a magnetic circuit, a portion of which is common to that with which the other windings are linked. Such an arrangement may consist of two ring cores, each provided with similar operating and secondary windings connected in series as in fig. 7. A third coil present on each core, but in one case reversed, will, if excited, have the following effect. Such e.m.f.'s as may be induced in each secondary by this third coil will not appear in the complete secondary circuit, as they will be in opposition; nevertheless, the magnetic circuits of each transformer will be excited. If such proportions be chosen that currents flowing in the restraining winding give rise to saturation of the iron, this will effect the secondary current corresponding to any given operating current. Excitation of the restraining winding is capable of increasing the reluctance of the magnetic circuit to such an extent as will necessitate a much greater operating current in order to deliver the required secondary energy. If, therefore, the operating winding be connected in place of the relay, this being connected to the secondary winding, the desired effect is obtained. A better type of construction is shown in fig. 8. Divided restraining windings are used which give a more efficient restraint, and

these windings will give rise to a saturating flux passing through the centre, as shown by the dotted lines. Former-wound coils may be used in this apparatus, and a further advantage is that an air gap may be used in the restraining magnetic circuit without reducing the unrestrained permeability of that associated with the other windings. A d.c. restraint can be incorporated which can be applied, when switching on a transformer, to prevent the operation of the relays due to switching-on current rushes. Fig. 9 shows a three-phase, delta/star transformer protected by the circulating-current system embodying biasing transformers. In this case a ratio-correcting element is included so that transformers with standard 5-A secondaries may be used for both sides of the transformer. Furt d.c. restraint is provided to prevent operation of the relays during switching-on periods.

A protective system for faults between turns has been patented, and, as its title denotes, has for its object the switching-out of a transformer in the initial stage of the development of a short-circuit between the turns on either the h.p. or l.p. winding. This apparatus, which is being manufactured by Messrs. Johnson & Phillips, Ltd., under licence, consists of one or more ring-type current transformers and a single- or three-pole relay, depending on whether a single- or three-phase transformer has to be protected. One winding of the power transformer, either h.p. or l.p., is split into two halves, which are connected in parallel, the parallel connections being taken in through the centre of a ring core upon which the secondary winding is arranged, the latter being connected to a sensitive relay. The two halves of the winding are arranged so that under normal conditions the impedance of each half is the same, hence the currents flowing in opposite directions through the ring-type transformer will be equal and will not give rise to any flux in the core of the current transformer. A short circuit between the turns of either the h.p. or l.p. winding will have the effect of altering the impedance of the two halves so that the currents flowing through the ring-core transformer will no longer be the same, hence a flux will be produced in the current transformer core causing operation of the relay. This method cannot be applied to existing plant without rewinding either the h.p. or l.p. winding, but it can easily be applied to new transformers without involving extra cost in manufacture. Especially is this the case with transformers wherein the l.p. current is fairly high, as the winding would, in any case, be split into two coils connected in parallel. On single-phase transformers the application is even more simple as the two limbs can be connected in parallel and only one current transformer is needed. The current transformers consist of ring cores with single bar conductors passing through the cores in a similar manner to the arrangement adopted for self-balancing protection. It will be realised that this system will only confine the damage due to a short circuit between the turns to the faulty turns. With other systems of protection the destructive effect due to a short circuit between the turns usually goes on until it develops into an earth fault, before the relays operate. This often involves the complete destruction of the winding and its repair is a fairly lengthy and costly business. With the system under consideration the transformer would be tripped out in the initial stages of the fault, and would considerably reduce both the cost and time required for repairs. The connections for a three-phase star-star transformer are shown in fig. 11, and for a single-phase transformer in fig. 10.

Wireless Telegraph Communication.

A review of the present position of maritime safety services, commercial communication, and point-to-point telegraphy in view of the proposed modified requirements and regulations to be discussed at the forthcoming International Conference in the United States next Autumn.

By Lieut.-Col. CHETWODE CRAWLEY, M.I.E.E.

THE International Conference of 1912 laid down regulations governing the installation and operation of wireless telegraph apparatus in ships, and it has been announced that the next International Conference will be held in October next at Washington, U.S.A., for the purpose of framing a new Convention.

The 1912 Convention dealt only with ships' communications, as there were then practically no wireless services between fixed stations, but the coming Conference will deal with all aspects of the problem, *viz.*, the communications of mobile stations, fixed stations, amateur experimental stations, and broadcasting. It may be of interest therefore, to take stock now of the present position of our commercial wireless communications, and briefly to indicate the main points which will come up for consideration at the International Conference.

(1) Ships' Safety Services.

The primary use of wireless telegraphy for shipping purposes is to lessen the chances of disaster at sea, and it is this aspect alone which we shall consider in this article.

Ships' Sets.—In this country it was laid down by an Act of Parliament in 1919, that every sea-going British ship registered in the United Kingdom, being a passenger steamer or a ship of 1,600 tons gross tonnage or upwards, must be provided with a wireless telegraph installation, and must maintain specified watches on the 600-metre wave, on a spark or interrupted-continuous-wave type of installation. The installation must be capable of transmitting clearly perceptible signals from ship to ship over a range of at least 100 nautical miles by day, and, in addition, emergency arrangements must be made for signalling

for six hours continuously, over a range of at least 80 miles for large ships and 50 miles for small ships, using a source of energy that is independent of the main power of the ship.

In addition to the ships' sets, it was laid down by the Board of Trade in 1925 that all our foreign-going passenger steamers which carry more than 10 lifeboats must have at least one of them fitted with wireless telegraphy, and if there are more than 15, or more than 20 lifeboats, at least one or two, respectively, must be motor boats fitted with wireless. Transmission must be on the 600-metre spark wave, giving a minimum metre-ampere figure of 15, and the normal receiver must be a valve type, with a crystal set as an alternative.

It is obvious that a method of rating stations by taking the product of maximum aerial current and the maximum height of the aerial, is more practical than rating them by range of working, which depends on so many circumstances. This is a matter which will be considered at the International Conference.

Operators.—The number of operators to be carried and their periods of watch, were laid down for different classes of ships. In ships which carry 200 persons or more, a qualified operator must always be on watch at sea. In ships which carry between 50 and 200 persons, a qualified operator must be on watch at scheduled times amounting to eight hours a day, and watchers who need only be able to recognise the distress (S.O.S.) and safety (T.T.T.) signals, must be on watch at all other times. In ships which carry less than 50 persons, a qualified operator must be on watch at scheduled times amounting to eight hours a day, and no watch need be kept outside these periods. Operators, who must be British-born of British parents, must be in possession of the Postmaster-General's certificate of proficiency.

Candidates for the examination for this certificate are trained at some two dozen privately owned schools. A watcher has also to pass a Post Office examination, but in his case the only qualification required is ability to recognise the distress and safety signals.

At present there are about 4,000 operators and 1,000 watchers serving in 3,150 British ships which are compulsorily fitted with wireless telegraphy.

The qualifications required for the various classes of operators' certificates and the regulations for having internationally scheduled times of watch, will come up for revision at the International Conference.

Inspection depôts are established by the Post Office at the principal ports for the inspection of ships' installations, to ensure that they conform with the regulations and are being properly maintained by the operators. About 3,500 inspections are carried out annually.

The Alarm Signal.—Automatic receiving apparatus has recently been designed by the Marconi Company and the Radio Communication Company to register the reception of an alarm signal by ringing a bell to call the operator to the instruments. Such apparatus, if found up to the standard required by the Government, will allow of all ships which are fitted with this apparatus being on constant watch for distress signals, without the necessity of employing watchers. The signal which has been selected in this country as an alarm signal for the purpose of working the automatic apparatus consists of a series of 12 dashes sent in one minute, the duration of each dash being 4 seconds, and the duration of each space one second. It is intended that this signal should be sent before the usual S.O.S. distress signal. There are no international regulations governing an alarm signal of this nature, and the matter is one which will come up for discussion at the International Conference.

All large passenger ships are now fitted with continuous-wave installations for long-range traffic, in addition to the spark sets which are compulsorily fitted for safety purposes, but it is laid down that all British ships, no matter how fitted, must stand by during their hours of watch to receive distress signals on the 600-metre wave on their spark receivers, whenever their continuous-wave sets are not in use, and in any case must do so for three minutes every half hour, at a quarter past and a quarter to each hour, G.M.T. This arrangement will be considered at the International Conference.

A great deal of ordinary traffic, in fact over 70 per cent., is still conducted on the 600-metre wave with the spark installations, as the great majority of ships are not fitted with continuous-wave installations, and as most of the coast stations throughout the world stand by on the 600-metre wave so as to be ready for distress calls. In order to reduce the present interference on the 600-metre wave, it is expected that regulations will be included in the International Convention by which much of this spark traffic will be transferred to other waves.

Directional Receivers in Ships.—Directional receiving apparatus, by which a bearing of a wireless transmitting station or ship can be taken, is now installed in about 9 per cent. of the British ships compulsorily fitted with wireless, including practically all our large passenger steamers, and as its great utility becomes more generally recognised, the number of ships fitted will no doubt increase rapidly. The sets used are fitted by the Marconi Company, the Radio Communication Company, and Siemens Brothers.

In the Marconi Company's sets, the aerial consists of two vertical loops in planes at right angles to one another, and in the receiving apparatus a coil is rotated, by which the strength of the received signals is varied. The direction from which the signals come is determined by the position of the coil when the signals are heard weakest. In the Radio Communication Company's set, the aerial is similar, and the direction from which the signals come is determined by rotating the loops until the strength of the signals is unaffected by reversing, with a switch, the mutual connections of the loops. In the Siemens Brothers' set, a single loop aerial is rotated, and the direction from which the signals come is determined by the position of the loop when the signals are heard weakest.

Recently, Mr. Watson Watt and Mr. Herd, working for the Radio Research Board, designed a form of directional receiver, which, when further developed, may prove of great value to ships. It is the nearest approach to a wireless compass yet produced, as it is a direct-reading instrument which can be used by the navigator on the bridge. This apparatus is still, however, in the experimental stage, and it is generally agreed that the directional instruments now on the market are best operated by a skilled wireless telegraphist.

The difficulties that ships labour under, compared with coast stations, are that errors may be introduced by changing the positions of guys, derricks, &c., that there are fewer opportunities of taking check bearings on known fixed wireless stations, and that errors may arise due to the necessity of having to refer the observations taken to the position of the ship's head as shown by the compass at the moment when the observation was taken.

Distress Messages.—In this country, including Ireland, the coast stations are worked by the British Post Office, and "look out" continuously on the 600-metre wave, with the exception of that on the Humber which is closed from 11 p.m. to 8 a.m. These stations are situated at Wick, Cullercoats, The Humber, North Foreland, Niton, Lands End, Fishguard, Seaforth, Port Patrick, Malin Head, and Valentia, so that a ship in distress anywhere near our coasts is in touch with at least one station. The average day range of the coast stations is about 250 miles, though of course much greater ranges are frequently obtained.

When a distress signal is made, all stations and ships which receive it, with the exception of those dealing with it, remain silent until the coast station which is handling the case, signifies that general communications may be resumed. This distress work often entails a complete cessation of commercial signalling

round our coasts for several hours. Nearly 100 distress cases are dealt with annually by our coast stations. The station which deals with a distress call takes all necessary steps to obtain assistance by wireless, telephone and telegraph, informing the Coast Guard, Naval Authorities, Lloyds, and others in special cases. No charge is made for any wireless messages in connection with distress work.

Weather Messages.—Other safety messages for which no charge is made are weather bulletins and gale warnings supplied by the Air Ministry, and navigational warnings supplied by the Admiralty. These are broadcast on the 600-metre wave at scheduled times by our coast stations. Weather reports are also broadcast on a 4,100-metre continuous-wave at scheduled times by the Air Ministry's station in London, and by wireless telephony at scheduled times on a 1,600-metre wave by the B.B.C. station at Daventry. In addition to the broadcast weather services, ships can obtain from any of our coast stations, for a fee of 7s. 6d., weather forecasts from the local meteorological station, or the Meteorological Office. To assist the meteorological authorities in preparing weather forecasts, arrangements are made by which certain ships, when crossing the Atlantic, send reports by wireless.

In the United States and Germany, experiments are now being carried out to apply the principles of telephotography to the broadcasting of weather reports, special receiving apparatus being fitted in the ship. By this means, the navigating officer, instead of drawing his own synoptic charts from the data received by wireless, will have the charts drawn for him by the receiving apparatus.

Directional Receivers on Shore.—Directional receiving apparatus of the fixed double-loop type is fitted at the stations at Cullercoats, Niton, and Wick, and bearings are given on the 600-metre wave to any ship on demand at a charge of 5s. per bearing; for the same fee, any coast stations will send signals to enable a ship fitted with directional receiving apparatus to obtain a bearing on the station. There is also a Post Office directional station on the 600-metre wave for ships at Flamborough, and a Naval station at The Lizard which gives bearings to merchant ships on the 800-metre wave for the usual 5s. fee. A new coast station which will be used for ordinary work and direction-giving purposes on the 600-metre wave, is being erected by the Post Office at Mablethorpe. This will replace the present Humber station and the direction-giving station at Flamborough. Directional receiving apparatus will shortly be added to the stations at Fishguard, Seaforth, and Port Patrick, and if found suitable will be available for giving bearings to ships on the 600-metre wave. Nearly 7,000 bearings were given to ships by the coast stations last year. All these directional stations are calibrated periodically, and can be relied upon to give bearings which are sufficiently accurate for navigational purposes up to distances of 100 miles by day and 50 miles by night.

Wireless Beacons.—Wireless beacons, *i.e.*, stations which transmit signals at regular intervals, in order that ships with directional receivers may be able to obtain bearings, have only recently begun to be established in this country, although a fair number has been established for some time in other countries, notably in the United States, where about 20 are now in operation. It is expected, however, that a number of these wireless beacons will be erected before long at suitable places round our coasts. Trinity House has already two in operation, one on Round Island in the Scilly Islands, and the other at the Casquets in the Channel Islands, working on a 1,000-metre interrupted-continuous-wave, and the Mersey Docks and Harbour Board is installing one in the Mersey. The Humber Conservancy Board is also about to open a wireless beacon at the Spurn Lighthouse in the Humber which, working in conjunction with submarine sound signalling apparatus, will enable a ship to obtain its distance as well as its bearing from the lighthouse, and the Commissioners of Irish Lights are installing a similar beacon in Dublin Bay. The wave lengths used and signals to be transmitted by beacons are to be considered at the International Conference. There are also forms of beacon stations which emit revolving beams of waves which can be made use of by ships fitted with ordinary receivers or with special simple receiving apparatus. These revolving beacons will no doubt be used commercially before long, but at present are in the experimental stage.

An interesting use of wireless for navigational purposes is the firing of fog guns by distant control. An installation of this kind is used at Gourock to fire fog signals at Rosneath Beacon. In case of fog, the transmitting apparatus on the mainland is put in operation and the signals when received at the beacon, over a mile distant, set in operation an apparatus which explodes a mixture of air and acetylene gas. Once started, the explosions continue so long as wireless impulses are received from the transmitting station.

The Trinity House authorities use wireless telephony to link up their light vessels off Ramsgate, Walton-on-Naze, and Cromer to each other and to the shore, and the Mersey Docks and Harbour Board has made similar arrangements in the Mersey. These stations, which work on a 250-metre wave, use a call-bell arrangement to obviate constant watch. With the exception of these services and of the weather reports sent from Daventry, wireless telephony is not used for ships' safety services, or, indeed, for any other ships' services, with the exception of a few fishing vessels. This is largely due to the fact that for equal range, telephony is more costly than telegraphy and, being less selective, is not so suitable for conducting a number of different services in the same area.

Spark Working.—Spark telegraph sets are undoubtedly the most suitable for distress work as the tuning is broad, which is a distinct advantage when dealing with many ships of many nationalities and accurate tuning cannot always be expected. In this respect interrupted-continuous-wave sets are not so good as spark sets for distress work, but are permitted for that purpose as they can be so readily modified for traffic purposes to continuous-wave working which will not interfere with any distress signalling that may be proceeding at the time. The tendency, undoubtedly, is to abolish spark working altogether, even for distress purposes, but due to the expense involved, it will take a considerable time before this is accomplished. The whole question is one which will be fully considered at the International Conference.

In this country the Post Office has decided to install an interrupted-continuous-wave set in place of a spark set at the new station at Mablethorpe, and to make a beginning with the conversion of the old stations from spark sets to interrupted-continuous-wave sets.

Time signals are broadcast principally for the use of shipping from many stations throughout the world, but at present the only time signals sent from this country are those transmitted from the British Broadcasting Corporation's stations.

(To be continued.)

Television.

A television installation between New York and Washington was demonstrated in the presence of spectators recently over a distance of 250 miles. New Yorkers in the laboratories of the Bell Telephone Company heard and saw Mr. Herbert Hoover in Washington deliver a brief address. According to the daily Press, his head and shoulders were seen in a dancing shadow composed of myriad small spots flickering upon a screen less distinct than an ordinary kinema picture. Mr. Hoover's facial expressions and movements were, however, quite visible. The installation was placed in an ordinary telephone booth, consisting of a small metal box, in which the telephone user was able to see the person with whom he was conversing. The first messages were sent by wire from Washington, and later a similar demonstration was given, utilising radio from Whippany, New Jersey.

Arbitration Law Reform.

The Lord Chancellor's Committee's Recommendations: Appeals from Arbitrators' Decisions; Umpires as Sole Arbitrators; Arbitrators' Fees; Arbitration Clauses in Contracts; Speeding-up Procedure; Codification.

[From a Legal Contributor.]

In March of last year the Lord Chancellor appointed a committee to consider the existing law relating to arbitration, and to make such suggestions for its reform as they should consider desirable. Seeing that the committee were presided over by a distinguished commercial judge and that Sir Thomas Willes Chitty was amongst the members, it is not surprising that a most valuable report has been the result.

From the point of view of the electrical engineer, arbitration is a much more important form of legal proceeding than an ordinary action at law. In the first place he is often appointed to act as arbitrator; secondly, disputes in relation to the class of contract which concern him are nearly always settled in this way. It is sometimes said that lawyers object to arbitration; but so far from objecting to this kind of litigation, they recognise that it is indispensable, for it would be impossible for the Courts to get on without the assistance of arbitration. Many an action which commences in the High Court is referred to an arbitrator, either by the order of the Court or by consent of the parties, and the lawyers find that arbitration is a very profitable source of income.

The committee have indicated in their report that there are certain defects in the present law which ought to be amended. They point out that, while the Courts do possess a certain appellate jurisdiction in relation to proceedings before an arbitrator, the right to appeal is not sufficiently clear in some cases. There is, of course, no appeal from an award as such. The only way in which the decision of an arbitrator can be reviewed in a Court of law is by having an award made in the form of a special case. Special cases are of two kinds. In one form the arbitrator merely invites the opinion of the Court as to a particular point of law. The Court having given its opinion, "the case" goes back to the arbitrator to be decided on the merits. There is at present no right to appeal to the Court of Appeal from this, which is called "the consultative" decision of the Court. The committee recommend that there shall be an appeal in such a case, by leave of the Court. Again, there is no power in the Court to order an arbitrator to state a case for the opinion of the Court.

The other kind of special case is one in which the arbitrator makes his award in that form. He can be ordered to so make his award, and when it comes before the Court judgment may be entered in accordance with the findings of the arbitrator, and there is an appeal to the Court of Appeal. The committee recommend that the practice relating to the two forms of special cases shall be brought into line, with this exception that there is only to be an appeal to the Court of Appeal from a consultative case by leave of the Court.

Perhaps the most important recommendation made by the committee is that which relates to a Court which consists of two arbitrators and an umpire. It has long been recognised that this form of tribunal is cumbersome and expensive, and that where there is an agreement to refer a dispute to two arbitrators and an umpire, the umpire only to act in case of difference between the arbitrators, it nearly always happens that the arbitrators disagree, with the result that the parties have to pay for a Court consisting of three persons where one would have been enough. The committee make the very sensible suggestion that where two arbitrators are to appoint an umpire, they must do so immediately, otherwise either party may apply to the Court, or a judge, for the purpose. They further recommend that at any time after an umpire has been appointed, either party may apply for an order that the arbitrators shall be discharged and that the case shall be conducted before the umpire as sole arbitrator without prejudice to the right of the arbitrators to act as witnesses.

It is also suggested, with regard to the fees of arbitrators, that where a dispute arises in relation to fees, as where, for example, an arbitrator keeps back his award until his fees are paid, an order may be made by the Court for the payment of the fees into Court to await taxation, it being competent for the arbitrator to be heard on the matter. This will get over a difficulty which has often arisen where an arbitrator has sought to exact what is considered to be an exorbitant fee for his services.

In certain minor particulars the committee suggests one or two important amendments of the law. Thus it often happens that a big corporation such as an insurance company is able to put forward a contract containing an arbitration clause which may press hardly upon the other party. For example, the contract may provide that an application for arbitration in the case of a dispute shall be made within a very short space of time. With a view to remedying this state of affairs, the committee would like to give the Court power to extend the time for applying for arbitration. They would also have the Court enabled to remove an arbitrator who is likely to be biased. They further recommend that where one party to a dispute is charged with fraud, that might be sufficient ground for refusing to compel him to proceed to arbitration.

A good deal has been said and written about the law's delays. We do not hear so much about delay in arbitration proceedings. This may be due to the fact that they take place in private, but that there is delay and consequent injustice is quite clear from the report of the committee. It is also apparent that under the existing law one party to a dispute has power to delay the proceedings almost indefinitely. Thus an arbitrator can prolong the time for making his award to any extent, and one party to a reference who desires to delay matters as much as possible can get his arbitrator to help him in this respect. The committee propose that unless an arbitrator makes his award with dispatch, then either party to the submission may apply to the Court or a judge for leave to revoke the submission, or for an order appointing an arbitrator or an umpire in the place of the one so in default.

There are a good many minor recommendations which are of more interest to the legal than to the engineering profession: of these, one should be mentioned. It is that, instead of amending the existing arbitration Act, a new Act should be passed codifying the law on the subject, and that this Act should contain in an appendix suitable forms of award. These should be of great assistance to lay arbitrators.

We earnestly hope that the Legislature may be able to find time to pass the necessary Act embodying these reforms in the near future.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The E.D.A.-E.L.M.A. Campaign.

One of the last demonstration houses to be run in connection with the campaign was that at Paisley, which is illustrated herewith. It closed on March 26th after being open to public inspection for a fortnight. In the illustration the floodlighting arrangement adopted can be seen clearly.

Demonstration House at Paisley.

Every room was equipped with thoroughly up-to-date apparatus and evoked the interest of a large number of visitors. The Paisley Circle had one of the first demonstration houses of the campaign; this was open for a fortnight in October last.

One of the houses built by the Pudsey (Yorkshire) Town Council on the Carlisle Road estate has been equipped as an all-electric house and was opened to public inspection on April 6th, by the Mayor (Councillor S. Myers).

Foreign Trade Development.

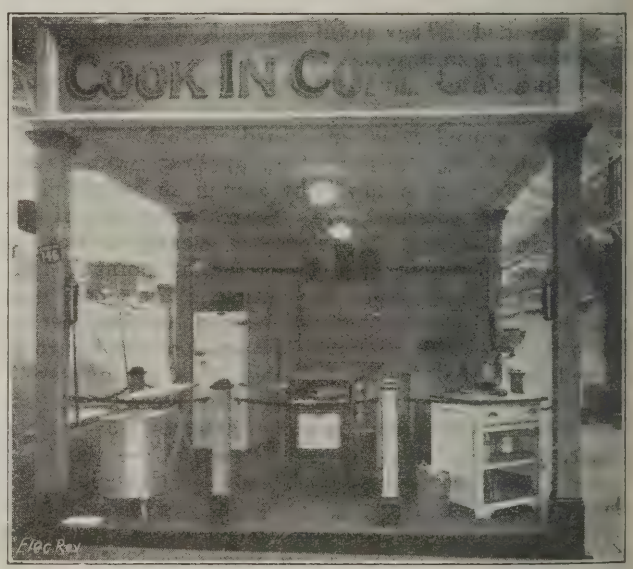
In reply to a suggestion put forward in the House of Lords that the Department of Overseas Trade should be abolished, Mr. R. B. Dunwoody, secretary of the Association of British Chambers of Commerce, recently testified to the value of the work accomplished by the Department. The Department's duties, he said, differed from those of the other departments of the State in that it helped to get orders for this country which might go elsewhere. The British Government was bound to do all in its power to further our overseas trade, and so far from abolishing the D.O.T., still more vigorous methods should be employed. Mr. Dunwoody considered that the abolition of the Department was a certain way of increasing the income tax. In a recent issue, the *Industrial Australian and Mining Standard* reported that a movement was on foot among German business men to bring pressure to bear upon the German Government to reorganise the Consular service on the lines adopted by the American Department of Commerce. The efficacy and efficiency of that department are extolled: it is said that United States foreign trade was increased by the Department by £100,000,000 during 1925, while the cost of the whole organisation is less than £600,000 per annum. Over two million inquiries were dealt with in 1925, and 50 per cent. of the inquiries are answered within 24 hours.

Foreign Competition.

The Dewsbury Town Council, on April 7th, recommended the Electricity and Tramways Committee to purchase foreign electric cable, when advisable, in view of the lowest tenders from British firms in the Cable Makers' Association having been from 25 to 34 per cent. higher than the lowest foreign tenders. The Town Council also decided to draw the attention of the Incorporated Municipal Electrical Association to this matter.

Badminton.

The badminton team of the St. Helens Cable and Rubber Co., Ltd., met the team of Callender's Cable and Construction Co., Ltd., on April 4th and beat them by eight events to one. The successful team comprised Mr. J. H. Brooking and Miss P. Baines; Mr. H. Evans and Mrs. Carey; and Mr. R. Wetton and Miss E. Bridge.



The Metropolitan-Vickers Electrical Co., Ltd., has a badminton expert in the person of Mr. T. P. Dick, who reached the semi-finals in the 1927 open singles all-England championship, and has won many events.

German Exports to New South Wales.

During December last electrical appliances valued at £1,652 were supplied by Germany to New South Wales, states the *Board of Trade Journal*.

Local Exhibitions.

Among the exhibits at the National Trades and Industrial Exhibition which is being held at Bingley Hall, Birmingham, from March 21st to May 14th, is that of the City of Birmingham Electric Supply Department, which comprises two model rooms of an "all-electric" house. Here are shown electric lighting fittings and electric fires, cooker and wash-boiler, a "Frigidaire" cabinet for domestic use, irons, kettles, a vacuum cleaner, a food mixer, and other electric labour-saving devices. One section of the Corporation's display—the kitchen—is depicted in the accompanying illustration.

An Electric "Kitchen" at Birmingham.

Another electrical exhibit is that of Tellus Super Vacuum Cleaner, Ltd., 394, Oxford Street, London, W.1, which is showing a new type of electric cleaner which can be converted into a fan, hair dryer, and bellows. Electrolux, Ltd., is showing its vacuum cleaners and refrigerators.

Erith.—An exhibition of various manufactures and commodities was held at the Erith Technical College on April 11th, 12th, and 13th. The arrangement of the electrical section was undertaken by Messrs. Dickenson & Co., Bexley Heath, and it comprised a complete range of "Magnet" household electrical appliances and a variety of "G.E.C." fittings. It is interesting to learn in connection with this exhibition that the district power rate was reduced from 2d. to 1d. per kWh as from April 1st.

East Kilbride.—The Clyde Valley Electrical Power Co. held a successful exhibition at East Kilbride, Renfrewshire, from April 7th to 9th. The company's engineers were in attendance and answered inquiries regarding supply, and electrical appliances of all descriptions were on view.

Radio Exhibition Poster Competition.

The Radio Manufacturers' Association is organising a competition to obtain a suitable poster to advertise this year's National Radio Exhibition. A leaflet setting forth the conditions of the competition has been printed and can be obtained from the secretary of the Association, Astor House, Aldwych, W.C.2.

Trade with Argentina.

A further address upon this subject was given by Sir A. Malcolm Robertson at a recent dinner of the Incorporated Sales Managers' Association. He said that, although British capital had provided public utilities all over Argentina and had developed many of the country's resources, Great Britain was losing ground in the Argentine market. Incessant strikes in this country had led to a lack of confidence on the part of foreign buyers, our prices in many cases were too high, and another handicap was high freights. Prices might be lowered and quality maintained by standardisation and mass production where these were possible. A carefully-thought-out propaganda campaign was necessary. It was useless repeating "Buy British goods"; the foreign buyer wanted to know *why* he should do so. Salesmanship was weak. The market could only be studied on the spot and not from a London office. Last, the 2 per cent. tax on foreign loans rendered it impossible for us to compete. If, however, an effort was made by British traders to co-operate, advertise, and work, we still had a great future in South America.

New French Company.

A new company has been formed at Boulogne-sur-Seine, with a capital of 535,000 fr. and the title La Société Le Fil Magneto, to manufacture electrical apparatus.

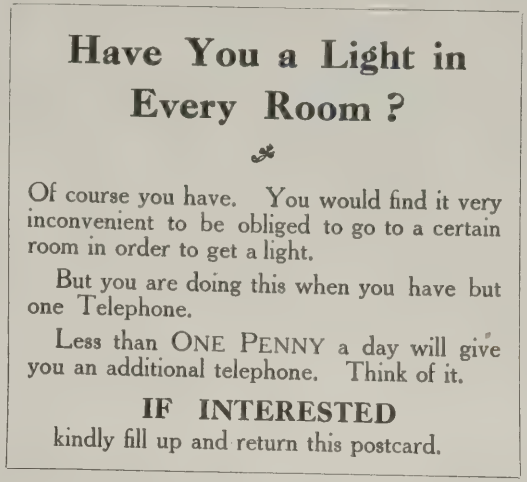
German Industrial Revival.

Herr F. von Mendelssohn, president of the German National Committee of the International Chamber of Commerce, was the guest of the British National Committee at a luncheon last week. *The Times* report of his speech states that Herr Mendelssohn said that Germany had seen the worst of economic stagnation and that conditions had begun to improve. In the second half of 1926 production and consumption experienced a steady augmentation which could not be explained merely by such adventitious events as the labour difficulties in British mining. It was due to the maintenance of regular prices, to industrial investments for the improvement of production, to increased savings, and to the increased purchasing power of the nation. A tendency towards amalgamation in industry formed the special feature of German economic organisation at the present time. Amalgamation within the Reich had bridged the way to an understanding with the industries of other countries; and this, in its future evolutions, might well lead to agreements which would do more than any customs tariffs or import prohibitions to preclude market anarchy and wild competition between one country and another.

Belgian Telephone Works Extension.

In order to meet the increasing demand for telephone material in Belgium, the works of the New Antwerp Telephone and Electrical Works Co. are about to be considerably enlarged.

Swiss Electrical Industry.



In a review of the progress of Swiss industries during 1926 issued by the Swiss Bank Corporation, it is stated that the important machine manufacturing industry of the country, after having suffered considerably during the general economic crisis commenced last year to recover, at any rate in several of its branches. As in previous years, an outlet for the greater part of the products of this industry had to be sought abroad, and it is remarked that in the second half of 1926 a severe form of protection was applied in certain countries. The review also remarks on the various resolutions passed at the recent Empire Conference in London in favour of the growing industry of the Dominions and that of the United Kingdom. It adds that the absence of the Russian market was particularly felt in Switzerland. Yet the level of employment generally in the electrical manufacturing industry was satisfactory, owing, partly, to the orders placed by the Federal Railways for the purpose of accelerating their electrification programme. As, however, the completion of all this work is approaching rapidly, the hope is expressed that orders from foreign countries, where Swiss finance is extending its influence in electricity supply companies, will gradually lead to contracts to follow those which are now nearing completion.

An X-Ray Warning Notice.

We have received a sample of the notices which Messrs. Watson & Sons (Electro-Medical), Ltd., are issuing with every X-ray equipment they supply, warning all users as to the precautions which should be conscientiously observed when operating the equipment. Clearly printed and permanently covered with celluloid, one copy is fixed inside the transformer cabinet, another is supplied loose for hanging on the wall of the X-ray room, whilst a third copy is attached to the instructions issued for handling the plant. Messrs. Watson are thus doing their best to ensure the safety of those who operate X-ray apparatus.

Telephone Development.

It is generally believed that the Telephone Service hides its light under a bushel and that it waits for people to approach it if they want telephones. This is not altogether true, as the accompanying illustration proves. This card, sent out by the Controller of the London Telephone Service,

A Card Issued by the London Telephone Service.

shows that not only is new business being sought, but an endeavour to extend existing services is being made. We may yet see a figure of two telephones per head of population!

The Telephone Development Association reports that during the run of the Ideal Home Exhibition no fewer than 115 agreements for telephone service—an average of five every day of the exhibition—were signed at the Association's stand. In addition, 239 names and addresses—172 in London and 67 in other parts of the country—were left by visitors who desired a visit from a Post Office representative in order to discuss the installation of service. These are being followed up by the Post Office, and in some cases agreements have already been secured. In the daily competition for a telephone free of rent for a year there were altogether 22,613 entries. Ten of these telephones fell to the London area, and the remainder to districts as widely separated as Aberdeen and Southampton. It is the intention of the Association to repeat the experiment at Manchester at a "Brighter Homes" Exhibition to be held from April 22nd to May 21st.

Unemployment.

After a long series of reductions, the number of unemployed rose by 3,170 during the week ended March 28th. The number at that date was 1,081,700, as compared with 1,078,530 on March 21st and 1,013,610 on March 29th, 1926.

Electric Power in Industry.

Further industries are dealt with in Preliminary Report No. 6 upon the Census of Production, published with the *Board of Trade Journal* for March 31st. The shipbuilding trades are first treated and it is shown that in 1907 these trades (in the United Kingdom) possessed 35,191 kW of generating plant, while in 1924 (in Great Britain) the aggregate capacity was 47,343 kW. Of the latter, marine engine works accounted for 35,756 kW, and shipbuilding yards for 11,587 kW. The aggregate capacity of electric motors installed was 498,415 h.p. in 1924; energy for 422,130 h.p. of these was purchased.

The generating plant installed in connection with the cement trade rose from 6,685 kW in 1907 to 43,700 kW in 1924. Motors aggregating 69,759 h.p. were installed, energy for 21,884 h.p. of which was purchased.

In 1907, 386 kW of generating plant was in use in the brush-making trade; in 1924 the figure was 1,478 kW, and the total h.p. of motors installed was 3,848 (2,138 h.p. purchased). The statistics for the coconut fibre, horsehair, and feather trades were as follows:—Generating plant, 1907, 27 kW; 1924, 645 kW; motor power installed 2,221 h.p. (1,548 h.p. purchased).

The supplement for April 7th deals first with the wire trades, and shows that the amount of installed generating plant rose from 2,336 kW in 1907 to 9,991 kW in 1924. In the latter year the capacity of installed motors was 71,612 h.p., power for 55,103 h.p. of which was purchased. The match trade power plant rose from 116 kW in 1907 to 2,348 kW in 1924. At the same time there was 3,152 h.p. of electric motors installed, power for 615 h.p. of which was purchased. The figures for the cardboard box trade were:—Generating plant: 1907, 478 kW; 1924, 903 kW. Motors installed, 5,710 h.p.; energy purchased for 4,737 h.p.

Syrian Tariff Modification.

It is reported that the duties upon electric pocket lamp batteries imported into Syria have been altered from 40 piastres per 100 to 25 per cent. *ad valorem* in the case of batteries from the United States or member countries of the League of Nations, and 50 per cent. *ad valorem* in the case of goods from other countries.

D

The Brazilian Market for Radio Apparatus.

Radio communication is fairly well extended in Brazil, and there are a large number of amateurs. The number of persons who have received authority from the Brazilian Telegraph Department is about 32,000, but the number of those in possession of receiving apparatus without such authority is much above those with licences. Of the apparatus imported, 5 per cent. comes from France, 6 per cent. from Germany, 20 per cent. from Great Britain, and nearly 70 per cent. from the United States. There is preference for valve sets, and those mainly in use have from three to five valves. About as many complete sets are sold as there are sets assembled from separate parts. For the former high prices are realised. The Americans have an advantage inasmuch as the different makes are standardised to some extent, and consequently spare parts can be obtained easily and cheaply. The Telegraph Department owns six stations of the Telefunken type on the coast, the power varying from 2 to 5 kW, transmitting at 300, 600, and 900 metres. There are also two continuous wave stations. Recently the Government established an extra high power station for international communication, the transmitting section of which is situated at Sepetiba and the receiving station at Jacarépagua. The installation is partly of French and partly of German manufacture, with a few pieces of apparatus supplied by British or American firms. There are a number of journals issued dealing with wireless matters.

New Catalogues and Lists.

Marconiphone Co., Ltd., 210, Tottenham Court Road, London, W.1.—Fully illustrated and priced 72-page catalogue of broadcast radio receiving sets and component parts. The V.2 receiver has been omitted, as very few remain in stock; gramophone amplifier equipment with electrical "pick-up" has been included, whilst amongst new components are the KL.1 transformer and power choke, a potential divider for use with anode-battery eliminators, a novel valve switch, and a new rubber valve holder.

Midland Electric Manufacturing Co., Ltd., Barford Street, Birmingham.—An illustrated pamphlet (No. 158), describing a new pattern "Memlock" change-over switch.

The Cork Manufacturing Co., Ltd., South Chingford, E.4.—A brochure advertising "Langite" jointing material for packing purposes, &c.

Empson Emulsifiers, 26, Bridge Road, Taylor's Lane, Willesden, N.W.10.—An illustrated pamphlet describing the making of cream by means of the Empson emulsifier.

The Relay Automatic Telephone Co., Ltd., Marconi House, Strand, W.C.2.—A booklet dealing in an interesting manner with the company's intercommunication system, and a pamphlet upon the same subject.

Messrs. C. W. Outram & Co., Woodville, near Burton-on-Trent.—An illustrated catalogue of porcelain insulators for electric lighting, heating, and power purposes.

Siemens & English Electric Lamp Co., Ltd., 38-39, Upper Thames Street, E.C.4.—April price sheet, containing illustrated particulars of all kinds of electrical apparatus and appliances.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., U.S.A.—A series of illustrated pamphlets describing the company's static condensers, current transformers, electric furnaces, loom motors, and paper-mill drives.

The Jackson Electric Stove Co., Ltd., 143, Sloane Street, S.W.1.—April calendar-blotter advertising "Jackson" wash boilers with a special spraying device.

The Drayton Regulator & Instrument Co., Ltd., West Drayton, Middlesex.—An illustrated publication dealing with the "Drayton" automatic de-superheater or attemperator.

The Wholesale Electric Lamp Co., Ltd., 150, Vauxhall Bridge Road, S.W.1.—A net trade price list of electrical materials, accessories, and appliances, including lighting fittings. Also an illustrated and priced leaflet advertising "Royalstone" dustproof lighting fittings.

The Dundee Electrical Repairs Co., Ltd., Erskine Street, Dundee.—A leaflet illustrating and describing an "indestructible" d.c. motor starting and control pillar.

The Brush Electrical Engineering Co., Ltd., Loughborough.—Publication No. 100/0-6a, an illustrated description of Brush-Ljungström turbo-generators of outputs from 5,000 kW normal to 7,000 kW continuous maximum rating.

Messrs. Wm. Geipel & Co., Vulcan Works, St. Thomas Street, S.E.1.—A pamphlet advertising "Ward-Leonard" dimmers for theatre lighting, as fitted in the Roxy Theatre, New York, which seats 6,200 people.

The L.P.S. Electrical Co., Ltd., Avenue Road, Acton, W.3.—A pamphlet advertising the company's test and battery clips, &c. Priced and illustrated.

The Tungstone Accumulator Co., Ltd., 3, St. Bride's House, Salisbury Square, E.C.4.—A folder advertising "Tungstone" accumulators, which are claimed to be free from permanent over-sulphation.

The Premier Electric Welding Co., Ltd., Abbey Wood, S.E.2.—An illustrated list dealing with the company's a.c. arc-welding plant. Also two booklets—one containing a reprint of a paper on "Thermal Disturbance in Iron and Steel during Welding," the other being a handbook for electric welders.

Messrs. Sydney Jones & Co. (London), Ltd., 28, Endell Street, W.C.2.—A price list of screws, nuts and washers of all kinds.

The Iron & Nickel Battery Co., Ltd., 17-19, Cockspur Street, Pall Mall, S.W.1.—An illustrated and priced pamphlet describing the "Ionic" electric hand lamp.

Trade Announcements.

Messrs. Philpot & Son, electrical engineers, of Canterbury, have removed from 3, St. George's Street, to 1, Iron Bar Lane, where the business will still be conducted by Mr. D. McKellar.

Messrs. Rossleigh, Ltd., of 31, Dumbarton Road, Stirling, announce that they are giving up the wireless branch of their business.

The new telephone numbers of Messrs. Mylan & Smith (Engineers), Ltd., of Sheffield, are 21371 and 21372. Sheffield changed over to the automatic telephone system on March 5th.

The Imperial Motor Works (Lyndhurst), Ltd., has changed its name to New Forest Services (Lyndhurst), Ltd.

The Kartret Switchgear Co., Ltd., is moving its sales organisation to its works at Wellesley Road, Sutton. After Easter all communications should be directed to that address.

W. R. Bottomley Private Telephone Co. has removed to Providence Electrical Works, Luck Lane, Marsh, Huddersfield. Telephone No. 3072.

Bankruptcy Proceedings.

A. J. Garrod, Whitehorse Place, Wellingborough, radio apparatus manufacturer.—The public examination of this debtor was held recently at the County Hall, Northampton. According to the statement of affairs there was a deficiency of £2,486. Debtor stated that in 1924 he commenced business as a valve repairer as the Unitron Valve Company, with £600. His business was fairly successful, and he experimented with a new valve. He required further capital, and a certain gentleman subscribed £250. An agreement was proposed under which he was to pay one-fourth of the profit. Later debtor received further sums amounting to £750 altogether, while two people each gave a £250 guarantee to the bank. Debtor said that another firm had come in with assistance in perfecting certain improvements which promised success, and it claimed as a debt the money which it had already lost, but debtor held that it was money spent on work from which they mutually hoped to benefit. The examination was adjourned.

A. H. Richardson, Wellingborough Road, Finedon, Northants, trading as "Radio Supplies," wireless manufacturer.—The public examination of this debtor was held recently at the County Hall, Northampton. The statement of affairs showed liabilities of £966, against assets of £98, leaving a deficiency of £868. Debtor stated that for some time he travelled for a radio firm at Leeds, and in February, 1925, opened a branch for the concern at Finedon, but later the firm went into liquidation. He then advertised at Kettering for capital, and was approached by another, who agreed to put £350 into the Finedon business, on condition of an equal division of profits with the debtor. A partnership was formed in May, 1925, and existed until April, 1926, when the partner, who had put further sums in, left, being paid £1,480. Debtor admitted that he had never done sufficient business to pay his way properly. The examination was adjourned.

T. F. Collier, 64, Union Street West, Oldham, electrician.—The first meeting of creditors was held recently at the Official Receiver's Offices, Manchester. The statement of affairs showed liabilities of £77, and there were no assets. Debtor attributed his failure to lack of capital. In 1919 he commenced business as an electrical engineer at Werneth, with £500 left by his father. The business declined, and in August, 1922, he sold it to a limited company for £430, in 430 £1 shares. In July, 1926, he recommenced as an electrical engineer, but owing to lack of capital was not successful, and in January last his trade effects were realised under an execution. The matter was left with the Official Receiver as trustee of the estate.

D. T. Donovan and H. A. Langlois, trading in co-partnership as the London Electrical Company, 119, St. Mary Street, Cardiff.—The adjourned public examination of these debtors was held recently at the Law Courts, Cardiff. Debtors agreed that they sustained a loss of £600 from May last year to December 13th, but did not admit that selling goods under cost contributed to their present position. Donovan agreed that £190 had been received in respect of apprentices, £170 of which was still owing, but they promised to try to repay this amount. The examination was closed.

E. Temple and Mrs. J. E. Burkett (Westoe Electrical Co.), wireless dealers and electrical contractors, 105, Canterbury Street, South Shields.—First meeting held April 12th at the Official Receiver's office, Government Buildings, 81, St. Mary's Place, Newcastle-on-Tyne. Public examination, May 5th at the Court House, Newcastle-on-Tyne.

F. J. Tizzard and N. Tizzard (Tizzard Bros.), electrical engineers and contractors, 27, Dalkeith Street, Barrow-in-Furness, and 121, Market Street, Dalton-in-Furness.—Trustee, Mr. W. G. Pearson, Official Receiver, 16, Cornwallis Street, Barrow-in-Furness, released March 30th.

J. R. Martin, electrical engineer, 11, Middlesbrough Road, South Bank, York.—First meeting, April 14th at the Official Receiver's offices, 80, High Street, Stockton-on-Tees. Public examination, April 29th at the Court House, Middlesbrough.

F. F. Gregory, electrical engineer, 2a, Westbourne Road, Luton.—Trustee, Mr. D. Helliar, Official Receiver, The Parade, Northampton, released March 30th.

Mrs. H. Spencer (Spencer & Son), wireless and cycle dealer, 30, Watergate, Grantham.—Receiving order made April 6th on debtor's own petition.

P. Cheshire (P. Cheshire & Co.), electrical engineer and contractor, Water Street Works, Middleton, Lancaster.—Receiving order made April 5th, on debtor's own petition.

W. J. Broome (Stockport Electrical Co.), electrical engineer, Garrick Place, Daw Bank, Stockport.—Receiving order made April 5th, on debtor's own petition.

Company Liquidations.

Carpax Co., Ltd., shippers of electrical and wireless goods, 312, Deansgate, Manchester.—A meeting of creditors was held last week, at Manchester, when Mr. J. Wilson, the liquidator in the voluntary liquidation of the company, reported that the liabilities were £727, all due to unsecured creditors. The assets were estimated to realise £473 net, leaving a deficiency of £254, so far as the creditors were concerned. It was stated that in addition to the liabilities mentioned there was a contingent liability in respect of an agency agreement, under which certain goods held by the company might have to be re-shipped. The company held a conference of its principal creditors on November 1st last, when figures were presented showing the position on the basis of a going concern, and they disclosed a surplus of about £280, the stock being valued at cost prices. That conference was called owing to the fact that the company was short of liquid capital, due to a slump in the wireless trade. Creditors for more than £10 each then decided to postpone payment of their accounts until March 31st this year in order that the company might have a chance to retrieve its position. A resolution was passed confirming the voluntary liquidation of the company with the present liquidator.

Service Radio, Ltd.—Winding up voluntarily. Liquidator, Mr. I. Levy, 27, Chancery Lane, W.C.2. Meeting of creditors, April 19th at the Institute of Chartered Accountants, Moorgate Place, E.C.

City Fuseboard Co., Ltd.—A meeting of members is called for May 9th at 147, Corporation Street, Birmingham, to hear an account of the winding up from the liquidator, Mr. J. W. Blackham.

Cleveland Electrical Engineering Co., Ltd.—A meeting of members is called for May 6th at 43, Albert Road, Middlesbrough, to hear an account of the winding up from the liquidator, Mr. M. McGilligan.

Radio Productions (Leeds), Ltd.—A meeting of members is called for May 5th at Standard Buildings, City Square, Leeds, to hear an account of the winding up from the liquidator, Mr. C. H. Baker.

Montreal Tramways & Power Co., Ltd.—A meeting of creditors will be held on April 25th, at Room 611, Power Building, Craig Street West, Montreal. Liquidator, Mr. F. H. Strouvelle, 24-28, Lombard Street, E.C.

Llandrindod Wells Electric Light & Power Co., Ltd.—A meeting of members is called for May 16th, at the Offices, Llandinam, Montgomery, to hear an account of the winding up from the liquidator, Mr. G. Edwards.

Automobile Electrical Repairers, Ltd.—A meeting of members is called for May 9th, at Sardinia House, Sardinia Street, W.C., to hear an account of the winding up from the liquidator, Mr. N. J. Dodd.

Private Arrangements.

F. J. Charlton, trading as the Essex Wholesale Electrical Co., 709, Romford Road, Manor Park, E.12.—A meeting of creditors was held on April 4th, at the offices of Mr. F. Sharles, 52, Queen Victoria Street, E.C., when a statement of affairs was presented which disclosed liabilities of £440 and net assets of £312, leaving a deficiency of £126. The debtor commenced business in March, 1925, with a capital of £518. The balance sheet for the year to December 31st, 1926, showed purchases of £1,804 and sales of £2,293. There was a net profit of £131 for the year. From January 1st to March 31st last the purchases were £246 and the sales £326, whilst the debtor's drawings were £88. No offer was made, and it was decided to confirm the deed of assignment already executed to Mr. Sharles as trustee, whilst a committee of inspection was also nominated. The following are creditors :—

	£		£
Electric Cables, Ltd. ...	21	Hackbridge Cable Co.,	58
London Conduit Fittings Co.	29	Stella Conduit Co., Ltd.	46
Scupham & Wood, Ltd.	44	Sandford & Co.	22
		De Maid, Ltd.	22

G. W. Cove, electrical engineer, 19, Bristol Road, Brighton.—A meeting of creditors was held recently, when a statement of affairs was presented by Mr. A. E. Orbell, 151-152, North Street, Brighton, which disclosed liabilities of £485, of which £385 was due to the trade and £100 to a cash creditor. The assets were estimated at £114, leaving a deficiency of £371. The cash creditor was the debtor's sister, in respect of money lent. The debtor had been in the employ of a well-known company, receiving a retaining fee and being paid for all jobs which he did. He was also allowed to carry on business on his own account. The arrangement did not prove successful so far as the debtor's own contracts were concerned. There was one contract for £170, which cost £300 in time and material to complete. Last October the debtor was taken ill, and was away for some months. In February a fresh arrangement was entered into with his employers, his retaining fee being increased, whilst he was also to continue to trade on his own account. The drawings had been at the rate of £6 a week. Lately creditors had been pressing, and a deed of assignment was executed to Mr. Orbell on March 30th. A resolution was passed confirming the deed already executed, and it was stated that the cash creditor would withdraw her claim. The following are creditors :—

	£		£
D'Accord	23	Siemens & English Elec-	
General Electric Co., Ltd.	55	tric Lamp Co., Ltd. ...	132

C. J. P. Davies, 9, Cheapside, Liverpool, electrical engineer.—A meeting of creditors was held on April 5th, at the offices of Messrs. R. Duncan French & Co., accountants, Liverpool, when a statement of affairs was presented which disclosed liabilities of £1,732; £1,248 of that was due to the trade and there was a loan creditor for £484. The net assets totalled £500, leaving a deficiency of £1,231. The debtor commenced business in November, 1923, with a capital of £150. Accounts prepared showed that for the period to the end of September, 1925, the sales were £3,700, and there was a loss of £15. In the following six months a loss of £275 was sustained. The accounts at that time showed a deficiency of £165. Since then the debtor's father had advanced certain sums of money. The present position was attributed to losses sustained on contracts, absence from the business through illness, and bad trade. An offer was made of 12s. 6d. in the £, which was subsequently increased to 15s. in the £, and was accepted, payable as to 10s. in three months and 5s. in six months. The following are creditors :—

	£		£
Dodd & Oulton	119	Downes & Davies ...	374
Hart, Collins & Co. ...	155	Lowe & Sons, G.	37
Wallin & Co.	48	General Electric Co., Ltd.	66
Liverpool Electric Cable Co.	20	Bankers	261
Stearn Electric Co., Ltd.	20	Davies, H. E.	483
Daniels & Son, T. ...	40		

A. J. Kirkby, Whitchurch, Ross-on-Wye, electrical engineer and radio factor.—Mr. P. S. Booth, 14-17, Holborn Viaduct, E.C., states that an investigation shows liabilities of £929 and assets of £228. The debtor commenced in the radio business 15 months ago with no capital of his own. His turnover for the first 12 months was about £1,000. A relative advanced sums from time to time, and her total claim amounts to £400. She has been asked to withdraw her claim, and in the meantime Mr. Booth is taking steps to realise the assets to the best advantage.

Welco Patents, Ltd.—Following informal meetings of the larger creditors, a scheme is proposed whereby creditors will be allotted 6 per cent. debentures in respect of the sums owing to them. In the meantime the receiver for the present debenture holders is carrying on the business with a view to the liquidation of those debentures.

Deed of Arrangement.

J. H. Gath, trading as the Gath Electrical Engineering Co., Halifax.—The trustees have issued a statement as at March 22nd. They say that a number of the assets remain unrealised; the delay in winding up the estate is due to the carrying on of the business as decided at a creditors' meeting in September last. It is hoped to complete the winding up within six months of ceasing to trade.

Anglo-Italian Conference.

The conference between representatives of the Federation of British Industries and of the Fascist Confederation of Italian Industries, held last week, discussed a number of questions of mutual interest and reached a certain measure of agreement. Among the matters dealt with were :—Uniformity of Customs practice; the adoption of specific standards for the valuation of imports and exports; the exchange of production statistics and information; international industrial agreements; fairs and exhibitions; the double taxation of the two countries' nationals; and international conferences.

The Luxemburg Concession.

The Council of State of Luxemburg has decided to give its approval to the project for the electrification of the province submitted by the Société des Centrales Electriques des Flandres. Two schemes are under consideration, the main one comprising the establishment of a distribution system, estimated to cost about £550,000, 25 per cent. of which would be borne by the Government.

Social Events.

The Amateur Dramatic Society of the Automatic Telephone Manufacturing Co., Ltd., assisted by the A.T.M. Orchestral Society, gave a successful joint performance at Liverpool on April 5th. Three short plays, comprising a comedy—"The Amateur Palmist"; a drama—"The Touch of the Child"; and a farce—"Uncle Sam," were presented by the Dramatic Society under the direction of Mr. J. Ready. During the intervals the Orchestral Society, under Mr. C. Brandreth, rendered selections.

On April 1st, the Victor Works of the Automatic Telephone Manufacturing Co., Ltd., held its final Social Club ball of the season at Colomba Hall, Liverpool. The function was well attended and resulted in a highly enjoyable evening. Messrs. Whitby and Anderson acted as M.C.'s.

Copper, Lead and Rubber Prices.

Messrs. F. Smith & Co. and Messrs. James & Shakespeare report April 12th:—No change in copper prices. English pig lead, £28, 5s. decrease.

Messrs. Edward Till & Co. report April 12th:—No change in the price of india-rubber, Para fine.

For Sale.

Ashford Urban District Council Electricity Department has a Lister electric lighting plant for disposal. Warrington Corporation Electricity Department has for disposal a number of second-hand d.c. motors. (See our advertisement pages to-day.)

Book Notices.

"Deafness Explained" is the title of a small book by Mr. C. M. R. Balbi, A.C.G.I., A.M.I.E.E. (John Bale, Son and Danielsson, Ltd., price 1s. net), in which the author deals with the subject as an electrical engineer in the interests of those afflicted with deafness. In a foreword Lord Charnwood sympathetically commends the work. The author, who is honorary consulting electrical adviser to the National Institute for the Deaf, deals with the principles of sound and hearing, and after outlining the causes of deafness, treats of the remedies that are available—most of them physical not medical, and many of them, of course, dependent upon electrical appliances, some of which he has described in our pages. A useful bibliography is appended to the brochure, which itself forms a very welcome addition to the rather meagre literature on this important but neglected subject.

"Year Book and Directory of the *South African Mining and Engineering Journal*, 1927." (460 pp.) London: Argus South African Newspapers, Ltd. Price, 12s. 6d., post free.—This book deals with the whole of the Union of South Africa, Rhodesia, and the Congo. It is, of course, mainly devoted to mining and industry, and there are several sections of interest to our readers. Probably the most useful is the directory and buyer's guide section, giving the names and particulars of the principal firms in the engineering, electrical, machinery and other trades. The electrical section deals with the activities of the Victoria Falls and Transvaal Power Co., Ltd., and other supply undertakings, and includes a full list of public undertakings with details of prime movers, voltages and frequencies, &c.

"The Colliery Year Book and Coal Trades Directory, 1927." Pp. 104+1032. London: The Louis Cassier Co., Ltd. Price 1 guinea net.—One effect of the prolonged coal dispute of last year is indicated in this 5th edition of the Colliery Year Book by the reduction in the list of colliery owners. Several additions have been made to the Statistical Section, including some data of the coal-mining industry in foreign countries. Several new articles are contained in this edition, including "The Future of the Coal-mining Industry," by Austin Hopkinson, M.P. "Some Notes on Machine Mining," by Lionel C. Maitland, contains much interesting information concerning the use of electricity in mines. A list of the electricity supply undertakings in the country is given. As usual the constitution of the various representative bodies in the industry is given, including the Mines Department and the employers' and employés' associations.

"Post Office Electrical Engineers' *Journal*," Vol. XX. Part I. April, 1927. London: Electrical Review, Ltd. Price 1s. 6d. net.

"Kempe's Engineer's Year Book for 1927." Pp. xliii+3101. London: Crosby Lockwood & Son. Price 30s. net.

"Selected Papers from the *Journal* of the Institute of Electrical Engineers of Japan." No. 11, "Temperature rise of Electrical Machinery and Comparison between Single and Double Ratings." No. 12, "Measurement of Acoustic Constants of Cloth." The Institute, 21, Mitsubishi Building, Marunouchi, Tokyo.

The Spring List of Sir Isaac Pitman & Sons, Ltd., contains particulars of a number of works upon business subjects, including accountancy, salesmanship, &c., as well as several technical and scientific books.

Scientific Papers of the U.S.A. Bureau of Standards. Vol. 21, No. 543, "Linkage-current Diagram for Representing Magneto Operation" (20 cents). Vol. 21, No. 554. "Effect of Eddy Currents in a Core consisting of Circular Wires." (10 cents.)

"*Journal* of the American Institute of Electrical Engineers." Vol. XLVI, No. 3. March, 1927. New York: The Institute. Price $1.

The German Electrical Industry.

According to the reports issued by the Prussian Chambers of Commerce, a revival of business took place to a moderate extent in almost all branches of the electrical industry in March. The increase in the consumption during the winter months has induced the supply works to begin placing orders for the next season on a larger scale, while various tramways have undertaken extensions and replacements. Further orders were given out by the Reich railways in connection with the electrification of the Berlin City and Circle railways. Orders were placed by the industrial districts, and a confident tone prevails which is manifested not so much in an increase in the orders as in the preparation of large schemes. The increase in building operations is also acting as a stimulus. Business in telegraph apparatus, fire alarms and clocks, and automatic exchanges, again improved, but the turnover in telephone apparatus was unsatisfactory. A slight improvement took place in the sale of electromedical products, and the sale of glow lamps also made progress.

Recent Contract.

The Wallasey Electricity Department has recently placed with Messrs. Simon-Carves, Ltd., an order for two of their water-tube boilers, each designed for a maximum evaporation of 70,000 lb. per hour at 300 lb. per sq. in. pressure, together with economisers, superheaters, chimneys, grit catchers, induced draught plant, coal bunkers, automatic coal weighers, unit type pulverisers, boiler feed pump, and all necessary valves and instruments.

Lighting and Power Notes.

Accrington.—Revised Electricity Charges.—The Town Council has revised the electricity charges from April 1st as follows:—Lighting, 5d. per kWh; heating and domestic purposes other than lighting, 0.7d. per kWh. On the ratable basis there will be a fixed charge of 15 per cent. per annum on the ratable value up to £100, plus 10 per cent. over £100, with a charge of 0.6d. per kWh. For power, rates vary from 2¾d. for the first 100 kWh per quarter to 0.75d. to the largest power users. For shop window lighting after shop hours one-half the flat rate is charged.

Bath.—Electricity in Small Houses.—Regarding the supply of electricity to the new houses at Newbridge and Larkhall, the electrical engineer has submitted a proposal to the Electric Lighting Committee for a special tariff to be applied to consumers of electricity in the Corporation houses, where the houses have been wired by the Housing Committee, as follows:—A standing charge of 48s. per year, plus 1d. per kWh for all electricity consumed for any purpose. The accounts would be collected with the rent at the rate of one shilling per week, and a debit or credit, as the case may be, given at the end of each quarter. The committee has approved the report and instructed the engineer to put the scale into operation.

Birkenhead.—Loan.—The Electricity Committee has recommended the Town Council to apply for sanction to a loan of £41,597 in connection with the electricity supply to Wirral.

Brentwood.—Institution Lighting.—In accordance with the requirements of the Board of Control, the Essex County Council proposes to convert the lighting of Brentwood Mental Hospital from gas to electric lighting. The cost of the installation of the necessary plant and wiring will be £22,750.

Bromley (Kent).—Electricity in Bulk.—The Town Council has applied for an Order authorising it to supply electricity in bulk to the Chislehurst Electric Supply Co., Ltd.

Canada.—Electrical Development.—The Ontario Hydro-Electric Power Commission will this year make considerable extensions to its system, the estimates of the Provincial Government including an appropriation of $14,970,000 for this purpose. The increase of transformer capacity in several of the leading cities and towns of Western Ontario will cost $5,500,000. The sum of $7,225,000 will be required for the construction of transmission and distribution lines, of which $5,000,000 will be devoted to the erection of a 220,000-V line to Eastern Ontario, including the cost of transformer stations. The development of the Thunder Bay system will cost $4,045,000, of which $3,875,000 will be spent on the Alexander Landing scheme now under construction. Bonuses for the construction of rural transmission lines, half the cost of which is borne by the Government, will be substantially increased, the estimate for this purpose ($750,000) being $250,000 in excess of the vote last year.

The Commission's operations during 1926 yielded a surplus of $565,000 on investments aggregating $203,000,000. During the year additional plant with a capacity of 100,000 h.p. was installed, and the Commission contracted for the future delivery of 340,000 h.p. from the Ottawa River.

In order to supply the growing requirements of the Rouyn Copper goldfield of Quebec, where active work is being carried on by many mining companies, the Canada Northern Power

Company is installing two additional units at its Quinze Falls plant, at a cost of $1,250,000.—*Reuter's Trade Service* (Ottawa).

Cheltenham.—Revised Electricity Charges.—The Corporation Electricity Committee has revised the electricity charges as follows:—Lighting (maximum demand): For the first 125 hours' use per quarter of the maximum demand, 6d. per kWh; for all additional energy, 2d. per kWh; flat rate, ordinary consumers (other than special supplies), 5d. per kWh; larger consumers (subject to guarantee and discounts as before), 4d. per kWh; churches and chapels, 4d. per kWh; kinematograph halls, combined rate, 2¾d. per kWh. Power (other than special contracts), 1½d. per kWh. Meter rents, 9d. per quarter for each meter not exceeding 1,000-W capacity, and 1s. per quarter for each meter above 1,000-W capacity. Slot meters, 7d. per kWh.

Crewkerne.—Electricity Supply.—It was reported at a recent meeting of the Urban District Council, that the promoters of the electricity undertaking had now complied with all the Council's requirements. A letter was read from Mr. J. A. Purves, joint promoter of the undertaking, pointing out that they were prepared to agree to the Council having the option to purchase at 22, 32, or 42 years. A draft of the proposed scheme was now being prepared, but no action had been taken regarding the inclusion of any area outside the urban district. The promoters thought, however, that it would be desirable to include certain of the adjacent parishes, which could get their electricity supply from Crewkerne, as a centre, more easily than from any other place.

Douglas (I. of M.).—Electricity Supply.—In the Tynwald Court recently the Corporation applied for sanction to the borrowing of £83,000 for plant extensions, buildings, mains and services, &c., in connection with the supply of electricity within the borough. According to the *Isle of Man Times*, Col. T. C. Ekin, Inspector to the Electricity Commission, questioned the present site's suitability for steam engines on the grounds (1) that there was not room for coal storage; (2) that there was not sufficient water available; and (3) that the dust would be a nuisance. The Corporation suggested that another expert should be called in. A resolution was ultimately carried "that the Tynwald approve of the Corporation raising a sum of £42,650, and that the question of the erection of further plant be deferred until further information be obtained from an expert nominated by the Governor at the cost of the Insular Government."

Leave was given the Corporation to supply electricity to an area two miles outside the town boundaries, including Onchan, Braddan, and Marown.

East Ham.—Street Lighting.—The Corporation Works Committee has recommended that the existing 300-W lamps on main roads be changed for 150-W lamps and that additional 150-W lamps be installed on all remaining standards which are now without lamps.

Guildford.—System of Supply.—In connection with the erection of the new generating station now in progress, the consulting engineer to the Guildford Corporation reports that it is necessary that the pressure of supply under that system should be formally fixed. He therefore recommends that the a.c., 3-phase, 50-cycle system be declared at 230 V between phase and neutral, and 400 V between phases. When the new system is put into operation the supply to the parish of Shalford, which is now a.c., single-phase, 50 cycles at 220 V, will have to be changed over. In order that the Corporation should be in a position, as circumstances permit, to develop the 3-phase a.c. system in any other part of the area of supply, it is desirable that powers should be obtained to change any parts of the existing 220/400-V, d.c. supply to the new system. The Electricity Committee has decided that application shall be made to the Electricity Commissioners accordingly.

Loan Sanctioned.—The Corporation Electricity Committee has received sanction to a loan of £14,700 for the installation of converting plant at Onslow Street central sub-station.

Mains Extensions.—The Committee is to extend the mains to Burnham housing estate, at an estimated cost of £1,126.

Iceland.—Water Power.—The extensive water-power resources of Iceland have recently attracted the attention of foreign capitalists, and preliminary work has been done with a view to the industrial exploitation of some of the most important waterfalls on the island. Norwegian, Danish, German, and English interests have been very active in Iceland since the war, and several concessions have been granted, including a notable one to the Dansk-Islandsk Anlaegsselskab for the exploitation of waterfalls in the Vestfjord. Another concern has for some time been investigating the possibility of the exploitation of certain other falls for the production of saltpetre, and is at present negotiating with the Iceland Government for a concession to exploit one of the largest waterfalls on the island.

Knaresborough.—Transfer of Undertaking.—The Urban District Council has decided to transfer its electricity undertaking to Harrogate Corporation, which has agreed to pay all outstanding capital liability, and revenue liability, and to place Knaresborough consumers on the same basis as the Harrogate consumers. The purchase figure is approximately £13,000. In addition Harrogate will take over the entire electricity staff.

Leeds.—Cable Subways.—The Corporation has arranged for the various committees to consider the question of the construction of subways for mains, cables, &c., with a view to the avoiding the constant breaking up of highways.

Loan.—The Electricity Committee is applying for sanction to a loan of £10,000 for assisted wiring installations.

Liverpool.—Loan Sanctioned.—The Corporation has received sanction to the borrowing of £145,000 for the erection of buildings and civil engineering works at the Lister Drive power station.

New Scale of Charges.—The Corporation has approved the following new tariff for the districts of Waterloo, Seaforth, and Great Crosby:—Flat rate for power (including heating and cooking) up to 3,000 kWh per annum, 2d. per kWh; 3,000 to 10,000 kWh, 1½d.; and over 10,000 kWh, 1d. Maximum demand system: For power a fixed quarterly charge of £1 10s. per kW of the maximum demand and 0.4d. per kWh, plus the present increase of 25 per cent.

London.—Battersea.—The London Power Co. has applied for sanction to erect a power station on a site about 15 acres in extent on the south bank of the River Thames, and is to purchase 3½ acres from the Metropolitan Water Board at a cost of £175,000.

Bermondsey.—The Electricity Committee has received sanction to the borrowing of £22,000 for mains and services, £5,000 for meters, and £10,000 for wiring installations.

St. Marylebone.—The Borough Council has received a communication from the Electricity Commissioners regarding its scheme for plant extensions and further bulk supply, in which they state that they propose to defer further action for six months.

Fulham.—The Electricity and Lighting Committee has recommended to the Borough Council that a new sub-station be erected in Barclay Road in substitution for the Granville Road sub-station and fitted with the necessary transformers, switchgear, &c., at an estimated cost of £8,100.

Maidstone.—New Plant.—The Town Council has applied for sanction to a loan of £60,247 for extensions to the steam raising and generating plant at the electricity works.

Assisted Wiring Scheme.—It has been decided to put into operation a scheme for the assisted wiring of premises, and to apply for sanction to a loan of £3,000 for this purpose.

Maldon.—Electricity Supply.—The Rural District Council has consented to an application by the Colchester Town Council to extend its area of electricity supply so as to include Tollesbury, Tolleshunt Knights, Tolleshunt D'Arcy, and Tolleshunt Major.

Manchester.—Progress during February.—During the month of February the Corporation electricity undertaking showed an increase in connections of 2,534 kW, bringing the total to 304,468 kW; and the number of applications received for supply, including consumers for additional supplies, was 927, representing a total of 2,178 kW. The number of hired cookers connected increased by 129, bringing the total actually on circuit to 2,917. Applications for the hire of cookers totalled 101. A new 150-kVA transformer was put into commission at Nuthurst sub-station.

New Zealand.—Auckland.—According to the *Electrical Engineer of Australia and New Zealand*, when the Arapuni hydro-electric station comes into operation next year, the greater portion of the Auckland Power Board's supply will be purchased from this source, and preparations are now being made for taking the larger supply. At present energy is transmitted from Waikato at 50,000 V to a Government sub-station at Penrose, where it is stepped down to 6,600 V for supply to Auckland. The new supply will be conveyed to Penrose at 110,000 V over three circuits, one of which is now operating at 50,000 V, while the other two are under construction. At Penrose the supply will be stepped down to 22,000 V for the Auckland Power Board, while there will also be a transformation to 50,000 V for transmission to the Waitemata Power Board. The Penrose sub-station at present accommodates a bank of transformers of 15,000-kVA capacity, 50,000/6,600 V. The building is being extended and two additional 15,000-kVA banks of transformers are to be installed. The transformers will step down from 110,000 to 22,000 V. In addition there will be another bank stepping up from 22,000 to 50,000 V for the Waitemata supply. A 10,000-kVA synchronous condenser will be installed to regulate the voltage. The Auckland Board purchases its bulk supply at the sub-station and is making preparations to convey it to the city by 22,000-V underground cables, an order for which has been placed. In addition to the power cables there will be a 12-core pilot cable for protective purposes. The work of opening up a trench to lay these cables has already been commenced.

Plymouth.—Loan.—The Town Council, on April 4th, approved a recommendation of the Electricity Committee that application be made for sanction to borrow £20,996 for electricity extensions. It was reported that an additional 3-phase h.p. feeder cable should be provided from the electricity works at Prince Rock to St. Budeaux, in order to meet the increasing demand in the Swilly and St. Budeaux districts, and to complete a ring main for the greater security of the supply throughout the district, in which there are now over 1,870 consumers.

Preston.—Main Extension.—At a cost of £2,235, the Corporation Electricity Committee proposes to extend the main in Tag Lane, Cottam.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Maidstone.—Lighting of business premises: From 7½d. to 7d. per kWh. First charge under the "telephone" system from 8s. to 7d. 4d. per 30-watt lamp.

Leyton.—The temporary increase of 10 per cent. has been removed.

Blackpool.—The increase of 10 per cent., imposed during the coal dispute, has been withdrawn.

South-East Lancashire Electricity Advisory Board.—New Transmission Line.—The Engineering Advisory Committee has recommended the Board to sanction the laying of a third 33,000-V main transmission line between Barton and Hill Top by the Lancashire Electric Power Co.

Special Order.—The Board has considered the application of the Altrincham Electric Supply, Ltd., for a Special Order to extend its area of electricity supply so as to include parts of the urban district of Altrincham and the rural district of Bucklow, and has resolved to defer expressing an opinion until the Central Electricity Board's scheme is made clear.

Power Station Extension.—The Committee has received an application from Altrincham Electric Supply, Ltd., for approval to the extension of its power station by one 6,000-kW turbo-alternator, and one additional 40,000 lb. water-tube boiler, with accessories, at an estimated cost of £44,615. The company reports that the Manchester Corporation's estimate for a duplicate main from Barton to Altrincham for a bulk supply is £100,000, to which would have to be added £33,284 for a sub-station with transformers and switchgear. Consideration of the matter has been deferred.

Bury Power Station.—The Bury Corporation has applied for sanction to install a 50,000-lb. boiler, together with economiser, stoker and chimney, at a cost of £14,800, to meet the requirements of 1927-28, and the replacement of certain existing plant by two 60,000-lb. boilers and one 10,000-kW turbo-alternator at an estimated cost of £99,000, to meet future requirements. The committee has recommended the Board to approve the boiler extensions required for the winter of 1927-28, and to adjourn consideration of the further extensions.

Fringe Orders.—The commitee has also recommended the Board to approve the application of the Cheadle and Gatley Urban District Council for a Fringe Order to supply electricity to certain premises outside its area.

The minutes of the proceedings of the Engineering Advisory Committee have been approved by the Board.

Southport.—Electricity Supply.—Extensions to the Corporation generating station having become necessary, information has been furnished the Electricity Commissioners as to the cost of a bulk supply from Preston or Liverpool, and the cost of local generation. It is hoped to obtain powers for extensions to the power station.

Assisted Wiring Scheme.—The assisted wiring scheme referred to in our issue of March 1st, p. 435, has now been approved by the Town Council.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by Mr. W. T. Warren for the supply of electricity in the urban district of Brightlingsea and the parish of Thorrington, and the Urban District Council of New Mills to supply electricity in its area.

Torpoint (Cornwall).—Power Station Fire.—A fire broke out at the local electricity works on April 7th. It started in a building containing the engine, and some oil tanks became ignited.

York.—Electricity Charges.—The Corporation Electricity Committee has fixed the following scale of electricity charges:—Lighting: Flat rate, private lighting, 4½d. per kWh. public houses, &c., 3½d. per kWh; maximum demand, 7d. and 1½d. per kWh; rateable value, 15 per cent., plus ½d. per kWh. Power: Varying from 1½d. per kWh for 1,000 kWh per quarter to ½d. per kWh for over 10,000 kWh per quarter.

Electricity Supply.—The Electricity Committee is to extend feeders at a cost of £9,000 and to renew mains at a cost of £2,750.

Tramway and Railway Notes.

Blackburn.—Fares.—At a meeting of the Town Council, on April 7th, a recommendation to reduce all fares within the borough to 1½d. was discussed. Ald. Higham criticised a motion for penny fares, and said it would mean a loss of £10,000 per year. The proposal to introduce penny fares was defeated by a large majority, and the recommendation for 1½d. fares was adopted.

Bradford.—Railless Cars.—The Estimates Sub-Committee has approved expenditure proposed by the Tramways Committee for the purchase of 10 new railless cars and additional overhead equipment, for the extension of the Oakenshaw-Ordsal railless-car service to the centre of the city.

Continental.—Hungary.—The Vienna correspondent of the *Daily Mail* reports that the English Talbot financial group's contract with the Hungarian Government for electrifying the railway trunk line from Budapest to Hegyeshalom, on the Austrian frontier, includes 55 electric locomotives and a power plant with a capacity of 75,000 kW. The Government reserves the option to cancel the contract before June 30th if unforeseen difficulties arise. This railway electrification will make Hungary almost independent of foreign supplies of coal. The contract has been awaiting the Commerce Minister's signature for several months, and this has now been obtained.

Holland.—Good progress is being made with the electrification of the Dutch railways. Electric trains are about to commence running between Haarlem and Rotterdam and between Haarlem and Ymuiden, and it is expected that the electrification of the Amsterdam-Rotterdam line will be completed by October next.

Switzerland.—The first of a new and improved type of electric locomotive has just been completed at the Brown, Boveri works at Munchenstein for hauling heavy express trains between Berne and Zurich. The engine, which runs on seven pairs of wheels and weighs 115 tons, is stated to have attained a speed of 62½ m.p.h.

Austria.—The work of electrifying the first stretch of the second section of the State Railways has recently been completed, and electric trains are now running between Woral and Innsbruck, a distance of 45 miles.

Egypt.—Railway Electrification.—It is announced that the necessary funds for the electrification of the Cairo-Helouan railway are to be provided in the Egyptian Government's Budget for 1927-28.

Hull.—Track Renewal.—The Corporation Tramways Committee is to reconstruct the track at Newland Avenue, at an estimated cost, including rails and accessories, of £11,300.

Japan.—Railless Cars.—Mr. G. Yamane, of the Yamaguch Prefectural Assembly, proposes to introduce a railless-car service between Ogi station and Koshigahama, a distance of five miles.

It is proposed to form the Inari Muki Densha K.K. for the purpose of running a railless-car service between Mito and Kasama Shrine, a distance of 13 miles.

Another railless-car scheme is proposed in Totte-machi, in the Ibaraki Prefecture, which will be 30 miles in length. The Kokuso Mukijo Densha K.K. is being formed at Soma-machi for this purpose.

Electric Railways.—New electric railways are to be constructed, and existing lines extended this year in the six Prefectures of Central Japan, which will increase the total mileage of electric railways by 241.

London.—Fares.—The Highways Committee of the L.C.C. has recommended that the 1s. daily tickets, at present in operation on the Council's tramway, be extended to local routes in East Ham, West Ham, and Walthamstow, on the same conditions as obtain on the Council's tramways, and that, as an experiment during the months of June to September, inclusive, 6d. daily tickets for children under 14 years of age, with the same availability as the 1s. tickets, be issued.

Telegraph and Telephone Notes.

France.—Speculation by Wireless.—According to the *Daily Telegraph*, for some time the official wireless research authorities in France have been puzzled about certain messages sent in code, but eventually direction-finding tests enabled them to locate an unregistered transmission station in a private house in the Rue de l'Assomption, Paris.

It is alleged that a group of financiers, having provided funds for the installation of this transmitting set, used it to send messages in code to stations in Amsterdam, Berlin, and certain places in Russia, where their agents, acting on their instructions, engaged in exchange operations. Summonses have been issued against five bankers and two wireless operators, who are to explain to an examining magistrate their reasons for the alleged infringement of the laws which subject wireless transmission to State control. The only charge against them at present is that they have robbed the State of revenue by sending eighty messages a day for several months without payment of any tax or licence fee.

Gibraltar.—Telephone Communication.—Telephone communication with Spain was established for the first time on April 4th in the presence of the Governor of Gibraltar, officials, the Spanish Consul-General, and representatives of the Spanish Telephone Company.—*Reuter* (Gibraltar).

Guernsey.—TELEPHONE STATISTICS.—The balance sheet and statistics for the year ended December 31st, 1926, relative to the State Telephone Department (engineer and manager, Mr. E. H. Bennett) show the gross revenue to have increased by £1,380 to £18,110, and the net profit (£762) to have been £487 greater than in the previous year. The total number of lines increased by 225 to 3,955, including 90 junction lines; the mileage of circuit wire overhead was 2,434, and underground 4,486, being increases of 49 and 558 miles respectively; the single wire mileages are double these figures. The number of switchrooms remained at five. The total number of calls increased by 75,909 to 2,393,121; trunk calls to and from Sark numbered 14,227. Telegrams and letters telephoned to the Post Office reached 22,954, an increase of 1,456. The staff, including 46 operators, increased by 2 to 85.

Submarine Telegraphy.—PROGRESS IN 1926.—The Bureau International de Telegraphie reports that during 1926 new submarine telegraph cables were laid between Bay Roberts (Newfoundland) and Plymouth (England); between Borkum (Germany) and the Azores; in the Pacific Ocean between Bamfield (British Columbia) and the Fiji Islands, and between the Cocos Isles and Australia.

Transatlantic Telephony.—NEW RECEIVING STATION.—The tuning-in of the first of the three three-mile long aerials of the new transatlantic telephone receiving station at Kemback, near Cupar, Fife, is now complete. Daily messages from the United States are received by the staff, which includes several American experts; reception is satisfactory, and the tuning of the other aerials will soon be complete; the three aerials radiate towards Denham, St. Andrews, and Pitscottie.

Radio Notes.

Lithuania.—STRICTER REGISTRATION.—The first sitting of the Exploitation Commission of the Kaunas wireless station was held recently to examine the activities of the station. Owing to lack of resources it has not hitherto been possible to develop; the number of registered subscribers in Lithuania at present is 1,500, of whom 1,000 are in Kaunas. Notwithstanding the regulations regarding the registration of apparatus, there are still many unregistered sets, it being estimated that the total number is 10,000. On the basis of the recent Cabinet decision, 75 per cent. of the receipts is assigned to programmes; the Commission therefore intends to introduce measures for the registration of all radio apparatus. Strict control will be enforced, and those who fail to register in time will be fined. Moreover, in shops dealing in wireless accessories, all apparatus and parts sold will be registered. It is proposed periodically to relay from the Kaunas station the more interesting programmes of the principal European stations.—*Reuter's Trade Service.*

New Continental Stations.—HUNGARY.—It is understood that the Radiotelefono Hirmond Co., of Budapest, is to build a 60-kW station similar to that at Langenberg; the scheme has the approval of the Hungarian Post Office authorities.

JUGO-SLAVIA.—A company has definitely obtained a licence for the erection of a transmitter of 6 kW. The company began its activities with a capital of 2,500,000 dinars, says *World Radio*. The station will be installed on the top of the Académie des Sciences at Belgrade.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the ELECTRICAL REVIEW containing the advertisement is given in parentheses below.

Contracts Open.

Ausralia.—MELBOURNE.—May 10th. Postmaster-General's Department. Telephone relays. (B.X. 3333.)*
May 17th. Resistances and reactances. (B.X. 3307.)*
May 23rd. State Electricity Commission. Switchgear and accessories. (B.X. 3285.)*
May 9th. 6,600-V transformers and spares. (B.X. 3331.)*
July 5th. One 15,000-kW steam turbo-generator and accessories. (B.X. 3369.)*
SYDNEY. — May 9th. Electricity Department. Station auxiliary switchgear. (B.X. 3338.)*
April 26th. A.C. electricity meters. (B.X. 3407.)*

Barking.—May 9th. County of London Electric Supply Co., Ltd. Cables and accessories for the Barking power station. (April 1st.)

Bolsover.—April 19th. Urban District Council. Cables, boxes, pillars, &c. (April 1st.)

Clayton.—April 18th. Urban District Council. E.h.p. feeder cables, l.p. distributing mains, fuse pillars and transformer kiosk. (April 1st.)

Colombia. — BOGOTA. — April 30th. Ministry of Public Works. Two electric lifts. A.X. 4433.)*

Dartford.—April 22nd. Electricity Department. 2,098 yd. l.p. cable. (See this issue.)

Dublin.—April 30th. Electricity Department. E.h.p. and l.p. cables, cast-iron and stoneware troughing, section pillars, compound and other materials and accessories. (See this issue.)

Dundee.—April 18th. Tramways Department. Stores for a year, including armature and field coils, insulating tapes, lamps, &c. Specifications, &c., from Mr. Duncan P. Morrison, general manager.

Edinburgh.—April 18th. Electricity Supply Department. De-aerating plant and boiler feed pumps. (March 25th.)

Glasgow.—April 19th. Lighting Department. Materials, including electrical fittings, &c., for one year. Particulars from the office of Lighting Department.
April 23rd. Parish Council and District Board of Control. Stores, including electrical fittings and lamps, for six months. Forms, &c., from Mr. A. Reynard, inspector and clerk, 266, George Street, Glasgow.

Grimsby.—May 2nd. Electricity Department. E.h.p. and pilot cables; l.p. feeder cables. (See this issue.)

Ilford.—April 26th. Electricity Department. One 1,500-kW motor-convertor or rotary-convertor and transformer, 6,600-V switchgear cubicles and alterations to existing switchgear. (April 8th.)

India.—India Store Department. April 26th. 66-kVA motor-driven alternator sets, transformers, switchgear, &c. (April 1st.) Telephone cable. (April 8th.) 53,825 inert electric cells. (See this issue.)

London.—LONDON COUNTY COUNCIL.—April 22nd. Electrical installation at the Stonhouse Street elementary school, Clapham (approx. 167 points. (April 8th.)
April 26th. Wiring and fitting for electric lighting in two blocks of tenements at the Ring Cross housing estate, Islington (approx. 274 wiring points). (April 8th.)
G.W.R. April 21st. Stores, including electrical wires and cables and telegraph ironwork. (April 1st.)
ST. MARYLEBONE.—May 18th. Electricity Department. L.p. and e.h.p. cables for 12 months. (See this issue.)
METROPOLITAN ASYLUMS BOARD.—April 25th. Installation of electric lighting, telephone, fire alarm and domestic bells in the engineer's house at the Western Fever Hospital, Seagrave Road, S.W.

New Zealand.—WELLINGTON.—May 31st. Public Works Department. 50-kVA transformers for the Waikaremoana electric power scheme. (B.X. 3294.)* 50-kVA transformer for Arapuni scheme. (B.X. 3293.)*
June 21st. Sub-station switchgear and metering equipment for Arapuni. (B.X. 3398.)*
June 7th. Railway sub-station equipment, Lake Coleridge electric power scheme. (B.X. 3295.)*
May 4th. General Post Office, Stores Division. Sub-station protectors. (B.X. 3286.)*
June 13th. New Zealand Railways. Machine tools, workshop equipment and overhead electric travelling cranes. (A.X. 4344.)*
June 6th. Six electric locomotives. (A.X. 4355.)* Overhead equipment for the Christchurch-Lyttelton electrification scheme. (B.X. 3301.)*
INVERCARGILL.—May 31st. Southland Electric Power Board. Transformers. (B.X. 3379.)*
June 15th. 66,000-V, oil circuit-breakers. (B.X. 3378.)*

Oldham.—April 30th. Electricity Department. Coal-handling and conveyor plant. (See this issue.)

Plymouth.—April 25th. Electricity Department. Electricity meters, cables, and transformers. (April 1st.)

South Africa.—JOHANNESBURG.—May 7th. Municipal Council. Electric street lamp fittings and globes. (B.X. 3395.)* Cables. (B.X. 3406.)*
CAPE TOWN.—June 1st. The University. Electric cooking utensils for the new residences at Groote Schuur. (B.X. 3393.)*

Southend-on-Sea.—April 19th. Light Railways and Electricity Department. 4,000 joint boxes. (March 25th.) 1,400 current limiters. (April 1st.)

Spain. — MADRID. — Ministerio de Fomento. Six electric cranes for the port of Alicante.

Stafford.—April 30th. Staffordshire Education Committee. Electric wiring and fittings for the new infants' department of the Slater Street Council school and in the additional class rooms, laboratory, &c., in the Salisbury Street central school. (April 8th.)

Uruguay.—Montevideo.—June 15th. State Electricity Supply Works. 15 transformer sub-station equipments (6,600/220 V., 50 cycles). (B.X. 3371.)*

Wrexham.—April 19th. Electricity Department. One 250-kW rotary-convertor equipment and d.c. switchgear. (April 1st.)

* Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Birkenhead.—Electricity Committee. Accepted:—
Switchgear for two sub-stations and 12 kiosks (£5,136).—English Electric Co., Ltd.
One 100-kVA transformer (£117), two 200-kVA ditto (£384).—General Electric Co., Ltd. Three 500-kVA ditto (£1,149).—Hackbridge Electric Construction Co., Ltd.

Bradford.—Tramways Committee. Accepted:—
Ten 36-seater railless electric trolley cars (£14,012).—English Electric Co., Ltd.
24 pairs of manganese steel points (£2,340).—Hadfields, Ltd.
30 tons cast-iron brake blocks (£292).—Yorkshire Repetition Castings Co., Ltd.

Brecon.—Town Council. Accepted:—
Plant, &c., in connection with the electricity scheme: Plant (£4,667).—Petters, Ltd. Battery and accumulators (£1,665).—Chloride Electrical Storage Co., Ltd.

Canterbury.—Town Council. Accepted:—
Automatic switchgear at £2,845.—A. Reyrolle & Co., Ltd.

Cheltenham.—Electricity Committee. Accepted:—
Cables for Cleeve Hill extension (£2,087).—British Insulated Cables, Ltd.

Dover.—
Installation of electric lighting, heating and power in the garages, workshops, &c., of P. J. Niblett & Son.—J. L. Etheridge & Co.

Hatton, near Warwick.—Warwickshire County Mental Hospital. Consulting engineer: Mr. A. B. Mallinson.
Boilers, mechanical stokers, feed pumps, &c. (£4,200).—H. & T. Danks (Netherton), Ltd.
Two 75-kW Belliss-G.E.C. engines and dynamos and one 35-kW ditto (£1,813).—G. N. Haden & Sons, Ltd.
Main switchboard (£445).—Erskine, Heap & Co., Ltd.
Storage battery and booster (£1,338).—Chloride Electrical Storage Co., Ltd.
Electric wiring (£6,693).—J. Collier & Co., Ltd.
Electric motors and tools (£994).—G. N. Haden & Sons, Ltd.
Heating and hot-water services (£7,343).—G. N. Haden and Sons, Ltd.
Complete laundry equipment, with dryers and calender (£3,118).—T. Bradford & Co., Ltd.

Hull.—Baths Commitee. Accepted:—
Electrical wiring and fittings at vapour and electrical baths:

Miller & Garness	£120
H. Hyde & Co.	117
James V. Coonan Co.	109
A. Shaw & Sons	106
King & Co., Ltd.	99
City Electric Co.	97
J. Wright	96
Clark & Graham	92
Wm. Broady & Son. (Accepted.)	**90**
City Engineer's estimate	110

London.—L.C.C. Education Committee. Recommended:—
Wiring and fittings at Drayton Park school, Islington:—

A. Shaw	£275
Bailey & Incledon, Ltd. (Recommended.)	**290**
Anderson, Angell & Co.	294
Alpha Manufacturing & Electrical Co., Ltd.	315
A. Meckhonik	325
Pinching & Walton	338
P. M. Braidwood	348
R. Hunt & Co., Ltd.	355
Smith & Hammond, Ltd.	360
A. Hawkins & Sons	392
City Electrical Co.	397
L. G. Tate & Co., Ltd.	408
G. Hopkins & Sons (Clerkenwell), Ltd.	450
Dalziel Engineering Co.	543

Metro-Vick Supplies, Ltd., has received contracts for the supplies of electrical accessories, &c., from the Islington, Paddington, and Stepney Boards of Guardians.

War Office.
Receiving, transmitting and rectifying valves.—Edison Swan Electric Co., Ltd.

Hull.—Tramways Committee. Accepted:—
Extension Hessle Road tramways (£3,330).—Sangwin, Ltd.

Lamp Contracts.—Metro-Vick Supplies, Ltd., has received a 12 months' contract for "Cosmos" lamps, &c., from the London & North-Western Railway Co. The North-Eastern Railway Co. has placed contracts for 12 months' supplies of electric lamps with the British Thomson-Houston Co., Ltd., and Siemens & English Electric Lamp Co., Ltd. Edison Swan Electric Co., Ltd., has received a contract for electric lamps from the London, Midland & Scottish Railway Co. Hull Corporation Tramways Department has placed a 12 months' contract for carbon and metal-filament lamps with Siemens & English Electric Lamp Co., Ltd.

Leeds.—Tramways Committee. Accepted:—
Track reconstruction, Woodhouse Lane (£640).—J. Speight.
Two pairs points, chrome steel, for experimental purposes (£150).—Thermit, Ltd.
Two lay-outs (£1,030), six pairs points (£726), eight crossings (£232).—Edgar Allen, Ltd.

Lichfield.—Town Council. Accepted:—
Electrification of a set of pumps at the Trent Valley Pumping Station (£101).—J. Richards & Co.

Liverpool.—Electric Power and Lighting and Tramways Committee. Accepted:—
Twelve months' supply of electricity meters.—Ferranti, Ltd.
Cables and accessories for street mains.—W. T. Henley's Telegraph Works Co., Ltd.; Callender's Cable and Construction Co., Ltd.; Dussek Bitumen Co., Ltd.; Penmaenmawr and Trinidad Lake Asphalte Co., Ltd.
Insulated cables.—Liverpool Electric Cable Co., Ltd.; Mersey Cable Works, Ltd.
One electrically-driven traverser for the Edge Lane car works (£409).—S. H. Heywood & Co.
Circulating-water, suction and discharge pipes for Lister Drive (£5,792).—Staveley Coal & Iron Co., Ltd.
H.p. switchboards for sub-stations.—Ferguson, Pailin, Ltd. (£10,805); Metropolitan-Vickers Electrical Co., Ltd. (£26,565).
Additional switchgear (£44,405).—Metropolitan-Vickers Electrical Co., Ltd.

Manchester.—Baths Committee. Accepted:—
Installation of electric lighting at Pryme Street baths.—R. H. Clampett & Co.
Housing Committee. Accepted:—
Installation of electricity at houses on various estates.—J. W. France & Co.; S. Dickinson; Fletcher and Turley; and Hanchett, Parratt & Currie.
Electricity Committee. Recommended:—
Cable.—Standard Telephones & Cables, Ltd.; and British Insulated Cables, Ltd.
Renewal of turbine blades at Stuart Street sub-station.—Richardsons, Westgarth & Co., Ltd.
1,500-kW motor-convertor.—Ateliers de Constructions Electriques de Charleroi.
750-kW motor-convertor.—British Thomson-Houston Co., Ltd.
Weldless steel lamp columns and fittings.—British Mannesmann Tube Co., Ltd.; and the Bromford Tube Co., Ltd.
33,000-V switchgear.—British Thomson-Houston Co., Ltd. 420-V ditto.—Metropolitan-Vickers Electrical Co., Ltd.; and 240-V ditto.—Whipp & Bourne, Ltd.

At the meeting of the City Council on Wednesday last week, Ald. Dagnall, chairman of the Electricity Committee, drew attention to the recommendation of the Committee to accept the tender of the Ateliers de Constructions Electriques de Charleroi for a 1,500-kW motor-convertor, switchgear, &c., for the Ancoats sub-station at £4,030. Three British tenders have been received for the same specification. The prices of the English firms were all within £1 and less, and they were 25 per cent. higher than the Belgian quotation. The lowest suitable British tender was £5,045 6s., the others being £5,045 10s. and £5,046. The chairman of the Electricity Committee, after giving these figures, said the Committee thought it time to let the British manufacturers know that while it was prepared to pay a good price and prices commensurate with the value of the machine, it was not going to pay artificial prices. The decision of the Council to give the contract to the Belgian firm was unanimous.

Preston.—Electricity Committee. Recommended:—
Duplicate of No. 3 generating set (£48,000).—English Electric Co., Ltd.

Oldham.—Electricity Committee. Accepted:—
Cable.—Union Cable Co., Ltd.
Education Committee. Accepted:—
Re-wiring and encasing electric mains at Clarksfield School. S. Charlesworth & Co.

Rotherham.—Town Council. Accepted:—
Three railless electric vehicle chassis (£995 each).—Clough, Smith & Co.
Three bodies (£520 each).—Charles H. Roe, Ltd.

South Africa.—Cape Town.—Accepted:—
Rewiring the Mount Nelson Hotel for a 220-V supply (£5,560).—E. A. Shaw & Co. (Cape Town).

Wallasey.—Electricity Committee. Recommended:—
12,500-kW turbo-alternator (£38,345).—English Electric Co., Ltd.
Two boilers (50,000 lb. per hour normal rating) and auxiliary plant (£46,840).—Simon Carves, Ltd.

Wimbledon.—Electricity Committee. Accepted:—
Two 10,000-V switch panels (£607).—A. Reyrolle & Co., Ltd.

Forthcoming Events.

Electrical Power Engineers' Association (Glasgow Section).—Friday, April 15th. Reed's Restaurant, Glasgow. 7.30 p.m. "X-Ray Plant and Practice." Mr. W. S. Weir.

Institution of Electrical Engineers.—Thursday, April 21st. London. 6 p.m. Kelvin Lecture, "High-frequency Currents." Prof. E. W. Marchant.

(Sheffield Sub-Centre).—Wednesday, April 20th. Royal Victoria Hotel, Sheffield. 7.30 p.m. "Some Magnetic Problems." Mr. A. Tustin.

(Tees-Side Sub-Centre).—Monday, April 18th. Cleveland Technical Institute, Middlesbrough. 7 p.m. Annual general meeting.

Birmingham Electric Club.—Friday, April 22nd. Grand Hotel. 7 p.m. "Radiation Effects." Mr. J. B. Kramer.

Association of Mining Electrical Engineers (North of England Branch).—Saturday, April 23rd. Durham. 3 p.m. "Accumulators (Lead-type)." Mr. A. W. Bridges; and "Electrical Testing Gear for Collieries." Mr. H. J. Fisher.

Notes.

Electrical Association for Women.

About 80 members of the above Association visited the new Tricity Restaurant, Strand, on April 6th, when Mr. A. F. Berry gave a very interesting talk on the history of the development.

At the last of the series of E.A.W. evening lectures, on April 6th, Mr. J. W. Beauchamp, Director E.D.A., spoke of the work which women are doing in the American electrical industry; a very interesting discussion followed.

Appointments Vacant.

Charge engineer for the East Sussex County Mental Hospital, Hellingly. Engineer-in-Chief for the County of London Electric Supply Co., Ltd. Two shift engineers for the Penang Municipal Commission. Inspectors for the Lift and Crane Department of the National Boiler and General Insurance Co., Ltd. City electrical engineer (£1,500), for the City of Salford Electricity Department. (See our advertisement pages to-day.)

The Largest Diesel-Electric Ship.

A contract was placed in March last with Scotts' Shipbuilding and Engineering Co., Greenock, by the Atlantic Refining Co., of Philadelphia, U.S.A., for an oil tanker of 12,500 tons deadweight. The vessel will be the largest in the world employing Diesel-electric propulsion; her length will be 469 ft., beam 63 ft., and moulded depth 36 ft. 9 in. The designed speed is 11 knots, and the oil engines driving the dynamos are to be of the Carels-Ingersoll-Rand four-cycle airless-injection type, built by the Carels firm (S.E.M.) in Ghent, Belgium. There will be four units of 750 b.h.p., each having six cylinders and running at 225 r.p.m. Each engine will drive an auxiliary generator of 75 kW mounted on the same shaft. The electrical machinery will be supplied by the British Thomson-Houston Co., Ltd., Rugby, and four 250-volt dynamos will run in series, supplying one 1,000-volt main propelling motor of the double-armature type, rated at 2,800 s.h.p. at 95 r.p.m. The auxiliary machinery will only require 1½ per cent. of the total horse-power installed.

The cargo pumps will be of the rotary displacement type, each coupled to an 80-h.p. electric motor installed in the engine-room and operated by remote control from the pump-room. The machinery will be controlled from the pilot house, and a gyroscopic compass is to be fitted. The Atlantic Refining Co. owns the largest fleet of Diesel-electric vessels in service, as there are five, the largest being the *J. W. Van Dyke*, with a capacity of 7,500 tons deadweight. The owners are now converting three additional tankers to Diesel-electric drive, each of which will be equipped with three 600-b.h.p. Ingersoll-Rand engines.

The *Motor Ship* also reports that the *District of Columbia*, which has been purchased by the Standard Oil Co., California, for conversion, will be equipped with four 1,000-h.p. Busch-Sulzer engines coupled to dynamos and running at 275 r.p.m. The vessel is a tanker of 7,641 tons gross, built in 1921, and she has a tank capacity of 83,146 barrels. The Parsons geared turbines originally installed developed 2,800 s.h.p. at 90 r.p.m., and gave a speed of 10 knots. Each of the new Diesel engines will drive a 700-kW d.c. generator supplying a double-armature propelling motor rated at 3,200 b.h.p. at 90 to 105 r.p.m. Excitation for the generators will be supplied from two 175-kW machines directly connected to the wing Diesel engines. The electrical plant is of the Westinghouse type. Auxiliary power in port will be obtained from a 60-kW generator, except when cargo is being handled, when one of the main generators will be run. All the deck equipment will be electrically operated.

A Week-End Engineering Conference.

The Manchester Engineering Council has organised a week-end engineering conference for employers and employés in the industry from April 22nd to 24th, inclusive. It is to be held at the University, Manchester, and will be opened with a public meeting in the Whitworth Hall, on Friday evening, April 22nd, at 7 p.m. The Lord Mayor and the President of the Council (Mr. L. E. Mather, chairman of Messrs. Mather and Platt, Ltd.) will hold a reception, followed by a public meeting, when Messrs. W. L. Hichens and W. M. Citrine (Electrical Trades Union) will open a debate on "Economic Production." The subjects for Saturday will be the "Future of Industry" (Mr. J. Rowan, of the Electrical Trades Union, presiding); "Arbitration in Industry"; and "Aspirations of Trade Unions" (Mr. S. Mavor in the chair). On Sunday morning Mr. E. J. Fox will speak on "Works Committees" (with Mr. C. G. Renold in the chair), while after luncheon Mr. Mather will sum up the proceedings and a service at the Cathedral will follow.

The Council was founded in 1918, and it has, as a result of its activities during nine years, secured a membership of 650. We learn from the honorary secretary, Mr. Gerald Webb (c/o Messrs. Mather & Platt, Ltd., Park Works, Manchester) that the movement has been well supported by prominent employers and trade union leaders in the district, and the average attendance at its ordinary monthly meetings is 250, drawn from all ranks of the industry, including shop workers. The Council is anxious that districts other than Manchester should be well represented, and we recommend employers, foremen, and trade unionists to communicate with Mr. Webb. We have attended many conferences which have been more or less representative of the different parties interested in industry, but discussions have often lacked an atmosphere of reality and seriousness, and we welcome the assurance that the present joint gathering of the engineering industry is such a one as has never before taken place. We wish the organisation every success, and shall watch the movement with interest and sympathy.

Cheap Electricity.

"Cheapest Electricity—How to Obtain It!" is the title of a brochure recently received from Messrs. Ruston & Hornsby, Ltd., of Lincoln, who introduce it as the considered opinion of an independent electrical engineer who is concerned only with the problem of cheap power supply. In effect it is a criticism of the Electricity Supply Bill (now an Act) on the basis of the relative costs of production in large and small stations. For this purpose the working costs and capital charges of a number of stations in each class are compared, and it is shown that while the large steam station can show a small economy over the oil-engine station at the bus-bars, this advantage is lost at a radius of six or seven miles owing to the capital charges on the transmission lines. The cost of transformation further handicaps the big station. It is suggested that the expenses of the Central Electricity Board will be out of proportion to the economy effected by centralisation of plant, and that bulk supply will have to be very cheap to justify the conversion of a small station into a distribution centre. As regards the small power user, he can generate electricity for himself with oil-driven plant so cheaply that it is difficult to secure him as a customer of the electricity works, and the elimination of the air-compressor by the use of cold-starting solid-injection engines reduces the capital cost, the risk of breakdown, and the cost of maintenance; actual experience shows that the fuel cost at 0.7 lb. of oil per unit generated, with fuel oil at 85s. per ton, is only 0.32d. Supplementing the article, the publishers give certified figures of running costs obtained in practice, showing that in one case where the cost per unit generated (excluding capital charges) was 0.614d., the owners (Crittall Manufacturing Co.) saved nearly £3,000 a year by substituting oil for coal. At another factory the plant cost £3,542 and generated 176,390 kWh per annum, at an inclusive cost of 1.43d. per kWh; and at a foundry where half this output was produced, the annual saving compared with the cost of public supply was £635—sufficient to pay for the plant in a little over two years. There is no doubt that public electricity supply undertakings must offer very low tariffs if they wish to compete with these small installations, which, though working at a load factor apparently much less than 20 per cent., show such low costs.

The I.E.E. Wiring Regulations.

We are indebted to the courtesy of the general secretary of the Association of Supervising Electrical Engineers for an advance proof of an article that will appear in the April issue of the Association's journal, *Contact*, with regard to the I.E.E. Wiring Rules. It is stated that in November, 1924, the Board of Control of the Association set up a special committee to examine the eighth edition of the Rules, which was issued in June, 1924, and on February 2nd, 1925, the Board submitted proposed amendments and suggested that an abridged version should be issued for the use of wiremen; in reply, the I.E.E. Wiring Rules Committee asked the N.A.S.E. to prepare one and submit it for consideration. This was quickly done, and on August 26th, 1925, the completed suggestions were delivered to the I.E.E. Thereafter nothing happened until May 4th, 1926, when the N.A.S.E. was informed that the I.E.E. Committee was "still waiting to receive the proposals of the Electrical Contractors' Association," which also wished to submit suggestions for an abridged copy. On February 25th, 1927, a printed abstract of the Regulations was submitted by the E.C.A. to the Committee; the N.A.S.E. representative claimed that as it was first in the field, its version should be dealt with first, and as certain items in the E.C.A. booklet which the I.E.E. Committee could not accept were absent from the N.A.S.E. proposals, the E.C.A. and the N.A.S.E. agreed to confer on the subject. In the meantime the I.E.E. Committee has decided to publish immediately a ninth edition of its Regulations, and the Association of Supervising Electrical Engineers (formerly N.A.S.E.) is examining the E.C.A. booklet and its own version in the light of this decision. It is urged that the abridged copy should be published on the authority of the Institution of Electrical Engineers, rather than that other authorities should issue their own abridgements. "The sooner the abridged edition is an accomplished fact the sooner will there be general adoption of the Regulations and efficient standards."

The last sentence suggests that the Regulations have not secured general adoption. It would be interesting to know the percentage of installations carried out during 1925 and 1926 in full compliance with them.

Irish Free State Electricity Supply.

Considerable indignation is manifest throughout the Irish Free State at the decision of the Government to take over control of the municipal and other electricity undertakings in the State and to work them in conjunction with the Shannon hydro-electric scheme.

During the Committee stage of the Electricity Supply Bill in the Dail Eireann, strong protests were made against the proposal, which was described as confiscatory, immoral, and economically unsound, more particularly as the Minister for Industry and Commerce (Mr. P. MacGilligan) announced that no compensation would be paid to the owners of existing municipal undertakings. Mr. John Good, a member of the Dail, spoke of the Government's attitude as that of wiping out valuable vested interests built up at the expense of the ratepayers, and instanced the case of Dublin, where the Corporation had achieved great success with its electricity undertaking and had given great satisfaction to all classes of the citizens by its electricity supplies for power, heating, and lighting.

The Minister's arguments that municipal authorities should not make big profits, and that using the profits of an electrical undertaking to relieve the rates was not viewed with favour by the Government, created much surprise. The Dublin undertaking cost £1,300,000, which, he said, had been paid by the electricity consumers, and if the Corporation was given compensation it would mean that the ratepayers would receive a further gift from the consumers. An amendment to the effect that compensation be provided for was, after discussion, rejected by 43 votes to 11.

Since then, some of the leading electrical experts in Dublin and elsewhere have joined in the protest against the confiscatory bearing of the Bill; in one quarter the proposal is bluntly referred to as "barefaced robbery," and in others it is feared that the result will be injurious to the Shannon scheme and may lead to serious complications in its operation and in the distribution of electricity. The scale of compensation, it is urged, could be drawn up on the basis of the market value of each undertaking, thus recognising the importance of the achievements of the local authorities and companies and private owners during a long series of years. There appears, however, to be little hope that the Minister will change his mind.

Mr. MacGilligan announced that he saw no reason why the distribution of electricity from the Shannon should not begin in February, 1929. He believed that the annual consumption then would be 75,000,000 units, and that this would be increased to 110,000,000 units in 1932, in which year it was expected the Board of Control would be able to pay the sinking fund and meet all working expenses out of revenue. He accepted an amendment under which electricity could be supplied from the Shannon scheme to consumers in Northern Ireland.

Major Bryan Cooper protested against the tendency on the part of the Minister not to give information called for by the House, remarking that at times one would think the Shannon scheme was the Minister's private property and that it was an impertinence on the part of the Dail to ask for details.

Civil Service Commission.

Regulations and particulars for the forthcoming examinations for probationary assistant engineers and probationary inspectors in the Engineering Department of the Post Office can be obtained from the Secretary, Civil Service Commission, Burlington House, W., together with the form on which application must be made. The latest dates for the receipt of application forms are July 14th and 28th respectively. (See our advertisement columns to-day.)

Boiler Explosion Report.

We have received a copy of the report on a preliminary inquiry into the cause of the explosion of a water-tube boiler at the London County Council's tramway power station at Greenwich in September last. The clamp retaining one of the header caps at the back of the boiler fractured around the bolt head, allowing the cap to be forced off and the contents of the boiler to escape. A crack appears to have formed in the clamp and gradually developed until the section of material left was insufficient to resist the stress imposed upon it.

Reinforced Concrete.

A booklet entitled "The Relative Value of Mild Steel and High-tensile Steel in Reinforced Concrete Construction," containing correspondence between Mr. H. Weston (of the Weston Concrete Engineering Co., Ltd.) and the Ministry of Transport, and reports on the subject by eminent experts, leads to the conclusion that the grade of steel used for reinforcement is of no importance; once a crack is formed it will soon reach the surface of a slab, whatever the kind of reinforcement.

The Budget.

Mr. Winston Churchill, the Chancellor of the Exchequer, introduced his Budget on Monday last. In the changes of taxation which he announced there appears to be nothing of direct electrical interest. The part of his speech likely to concern our readers was that relating to the disappearance of three departments—the Ministry of Transport, the Mines Department, and the Department of Overseas Trade. In Mr. Churchill's own phraseology, the Ministry of Transport is to be abolished as a separate department; the functions of the Mines Department are to be distributed; and the separate existence of the Department of Overseas Trade is to be terminated. No direct reference was made regarding the future of the Central Electricity Board and the Electricity Commissioners; presumably these will come under the *ægis* of the Board of Trade.

The Batti-Wallahs' Society.

On Tuesday, April 26th, at a luncheon at the Hotel Cecil, London, Sir Arnold B. Gridley, K.B.E., M.I.E.E., will deliver an address on "How to Reconcile Relations between the Consumer, the Producer, and the Wage-earner."

Educational.

Northampton Polytechnic Institute, Engineering Day College.—The entrance examination in connection with the Engineering Day College will be held on Tuesday, April 26th. Further information can be obtained on application to the Principal. (See our advertisement pages to-day.)

Institution Notes.

Institution of Electrical Engineers.

North-Western Centre.—The annual meeting of the North-Western Centre of the I.E.E. was held on April 5th, at Manchester, Mr. W. J. Medlyn presiding. The report of the Committee showed that the aggregate membership was 1,108, made up of 112 members, 440 associate members, 12 associates, 149 graduates, and 390 students. Compared with last year, there was a decrease of 37 in the number of students, and increases of 2 members, 23 associate members, and 23 graduates, the net increase being 11. The chairman announced that Mr. Ratcliff, who, in the ordinary course, as senior vice-chairman, would have become the chairman of the Centre this year, did not wish to do so. Mr. Lunn, the hon. secretary, found that pressure of business compelled him to give up the position, and the Centre was to lose Mr. Watson, who had been appointed chief engineer of the London and Home Counties Electricity Authority. The election of officers resulted as follows:—*Chairman*: A. B. Mallinson; *vice-chairmen*: W. J. Wood and T. E. Herbert; *hon. secretary*: J. D. Peattie; *new members of the committee*: Messrs. O. Howarth, H. Hawkins, G. A. Juhlens, A. L. Lunn, and Cobden Turner.

North-Western Students' Centre.—On Tuesday last, at the annual general meeting of the Students' Centre, an address was to be given by Mr. J. A. Robertson, M.I.E.E., on "The Electricity Supply Act, 1926—and After." The nominations for election of committee, to take place at the meeting, included the names of Mr. G. R. Millward (hon. secretary) to be chairman, and Mr. W. L. England to be vice-chairman of the Centre.

Institute of Metals.

At a general meeting to be held on May 11th, the seventeenth annual May Lecture will be delivered by Sir Henry A. Miers, F.R.S., on "The Growth of Crystals in Supersaturated Liquids."

The Faraday Society.

On April 22nd and 23rd a general discussion is to take place on the theory of strong electrolytes, at the University Museum, Oxford, under the chairmanship of Prof. C. H. Desch. Some 24 papers are to be submitted. Admission will be by ticket. The annual general meeting will be held in London on May 25th, and is to be followed by an ordinary meeting.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.

Mr. D. R. Wilson has been unanimously nominated by the Council of the Illuminating Engineering Society as President. Mr. Wilson has done much valuable pioneering work on industrial lighting; the reports of H.M. Chief Inspector of Factories from 1911 onwards contained special contributions by him on the lighting of factories, and he took an active part in the subsequent formation of the Home Office Departmental Committee on Lighting in Factories and Workshops, of which he became secretary. He is also a member of the Illumination Research Committee, working under the Department for Scientific and Industrial Research, by which important researches bearing on industrial lighting have been carried out.

The Reading Borough Council has advanced the salary of Mr. Arthur Higson, who has charge of the electrical and mechanical gear in the Borough Engineer and Surveyor's Department, by £28 per annum to £340, plus £26 per annum car allowance.

The Spenborough Urban Council has made a special grant of £75 to the electrical engineer in respect of past and prospective special services in connection with the "change over" at the works.

Mr. R. H. Wilkinson, city tramway manager, Bradford, has been authorised by the Tramways Committee to take part in the visit to Budapest, as a member of the Committee of the Municipal Tramways Association, which is going there to inspect overhead equipment methods and other tramway matters.

The Accrington Town Council has considered a recommendation that the salary of Mr. Clegg, the electrical engineer, should be increased from £866 to £913 per annum, with a further advance from April 1st, 1928, when the basic salary should be £750, plus the prevailing bonus. After discussion the proposal was referred back by 13 votes to 11.

The engagement is announced of Mr. S. Dickson Moyse, only son of Mr. and Mrs. Leon Moyse, of New York and Paris, and Miss Kathleen Railing, younger daughter of Mr. and Mrs. M. J. Railing.

Mr. A. J. Waring, distribution engineer at the Torquay Electricity Works, who is leaving to become borough electrical engineer at Newark-on-Trent, has been presented by the staff with an eight-day clock.

On April 6th, the staff and employés of the Paisley Corporation Electricity Department met to honour seven of their number who have completed 25 years' service. Mr. W. Blair Smith, engineer and manager, presided, and Miss M. R. Hart made suitable presentations to the following employés:—Messrs. J. M. Barbour, G. A. F. Allison, R. Mitchell, Joseph Thompson, John Hogg, John Cunningham, and James Lawrie.

Confirmation has been received of the recent rumours that Mr. P. N. Rand, the general sales manager of the Metropolitan-Vickers Electrical Co., Ltd., is severing his connection with that company. He will officially terminate his connection with the M-V Co. on September 30th next (by which time he will have completed nearly 19 years with them), but will relinquish his active representation about the middle of May and indulge in a well-earned rest. He will be at Buxton during the I.M.E.A. Convention and in Newcastle for the I.E.E. Summer Meeting, after which he expects to travel abroad for a few weeks before taking up new duties. We join with Mr. Rand's many friends in wishing him success in his future activities. His address from the middle of May until further notice will be c/o Royal Automobile Club, Pall Mall, London.

Obituary.—Mr. A. R. Hardie.—We regret to learn from the *Financial Times* of the death, which occurred suddenly on April 8th, at the age of 74, of Mr. A. R. Hardie, who had been associated with submarine cable enterprise for 57 years. "Mr. Hardie came from Scotland, and as a very young man joined the old British Indian Submarine Telegraph Company under the late Sir John Pender in 1870. Two years later took place the great amalgamation of submarine telegraph companies, known to-day as the Eastern Associated Telegraph group—the largest cable undertaking in the world. He was appointed chief accountant of the Eastern Telegraph Company in 1886 at the early age of 33, becoming secretary in 1903 and a director in 1922." He leaves a son (Lieut.-Col. Claude Hardie, D.S.O., of the English Electric Co., Ltd.).

Lt.-Col. P. W. d'Alton.—We learn with feelings of deep regret of the death, which occurred on April 10th, at Westcliff, at the age of 71 years, of Lt.-Col. Patrick Walter d'Alton, M.Inst.C.E., M.I.Mech.E., M.I.E.E. We shall refer to the career of the deceased gentleman in our next issue.

Financial Section.

New Companies. Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Dionoid Battery Co., Ltd.—Private company. Registered April 6th. Capital, £10,000 in £1 shares. Objects:—To manufacture and repair electric accumulators of all types; to carry on the business of electricians, mechanical engineers and manufacturers, manufacturers of, and dealers in telephones and telegraphs (wireless or otherwise), dynamos, magnetos, &c. The subscribers (each with 100 shares) are:—G. H. Trotter, 17, Broomhall Road, Sheffield, engineer; H. H. Barton, 17, Broomhall Road, Sheffield, instructor captain, R.N. (retired). G. H. Trotter is the first director. Qualification, 100 shares.

S. L. Electrical Co., Ltd.—Private company. Registered April 6th. Capital, £200 in 1s. shares. Objects:—To carry on the business of electricians, manufacturers, generators, accumulators, suppliers and distributors of electricity and electrical energy for lighting, heating, telegraphic and telephonic communications, &c. The directors are:—C. H. Morrell, 1, The Terrace, Champion Hill, S.E.5; E. J. Evershed (managing director), address not stated. Secretary: C. H. Morrell. Solicitors: Helliwell, Harby & Evershed, Thanet House, 231, Strand, W.C. Registered office: Thanet House, 231, Strand, W.C.2.

Cleartron (1927), Ltd.—Private company. Registered April 6th. Capital, £10,001 in £1 shares (7,501 "A" and 2,500 "B"). Objects:—To carry on the business of manufacturers of, and dealers in wireless apparatus and accessories of all kinds, &c. The subscribers (each with one "A" share) are:—Elsie E. Styles, 29, Rosetta Street, Stockwell, S.W., clerk; L. H. Gurney, The Den, Priory Avenue, Harlow, Essex, clerk. Directors: M. F. Mieville and others to be appointed by the subscribers. R. J. Ireland also signs as director. Registered office: 21, Cumberland Street, Birmingham.

Berkeley Electrical Engineering Co., Ltd.—Private company. Registered April 2nd. Capital, £15,000 in £1 shares. Objects:—To adopt an agreement with F. G. Minter, Ltd., and to carry on the business of electrical engineers and contractors, suppliers of electricity, carriers of passengers and goods, manufacturers of, and dealers in railway, tramway, electric, magnetic, galvanic, and other apparatus, &c. The first directors are:—F. G. Minter, 26, Norfolk Street, Park Lane, W.; F. A. Minter, "Greystock," Peek Crescent, Wimbledon Common; C. J. Goldsmith, "The Nook," Well Lane, East Sheen, S.W.14; A. E. Williams, "Callancrags," Woodcote Valley Road, Purley; A. H. Beatty, "Chellow Dene," Putney Hill, S.W.15 (directors of Balfour, Beatty & Co., Ltd., and other companies). Qualification, 100 shares. Solicitors: Walter Burgis & Co., 31, Budge Row, E.C.4. Registered office: 29, Buckingham Gate, S.W.1.

Dental and General Radiography, Ltd.—Private company. Registered April 7th. Capital, £100 in 99 "A" shares of £1 and 20 "B" shares of 1s. each. Objects:—To carry on the business of dental and general radiographers and radiologists, including also any curative, remedial, or therapeutic treatment by the employment of long or short wave-lengths, whether of light, heat or electricity, &c. The permanent directors are:—F. Daphne (chairman), 10, Charterhouse Square, E.C.1; L. F. E. Johnson, 9, Highbury Grange, N.5. Solicitors and registered office: Daphnes, 10, Charterhouse Square, E.C.

Loewe Radio Co., Ltd.—Private company. Registered April 1st. Capital, £100 in £1 shares. Objects:—To carry on the business of producers, manufacturers, importers and exporters of, or dealers in radio devices, instruments and apparatus of all kinds, &c. The subscribers (each with one share) are:—J. F. H. Kempler, 3 and 4, Clement's Inn, W.C.2, solicitor; G. M. Down (same address), articled clerk. Directors' qualification, 5 shares. Secretary (*pro tem.*): F. J. Wright. Solicitors: Brown, Turner & Co. Registered office: 3 and 4, Clement's Inn, Strand, W.C.2.

Ashworth & Smith (Electrical Supplies), Ltd.—Private company. Registered April 2nd. Capital, £1,500 in £1 shares. Objects:—To carry on the business of electrical, mechanical, civil, agricultural, or other engineers, &c. The first directors are:—R. Nette, 13, Hulme Hall Avenue, Cheadle Hulme, Cheshire; S. Gillett, 426, Buxton Road, Stockport. Qualification, 50 shares. Secretary: R. Nette. Solicitors: Pattinson and Harrison, Macclesfield. Registered office: 27, Blackfriars Street, Manchester.

Logan Electric Supplies, Ltd.—Private company. Registered in Edinburgh April 2nd. Capital, £1,000 in £1 shares. Objects:—To carry on the business of distributors of all kinds of electrical goods, &c. The subscribers (each with one share) are:—R. Logan, "Knocknair," Kilbirnie, retired school teacher; J. Logan, "Knocknair," Kilbirnie, wireless representative. Registered office: 144, West Regent Street, Glasgow.

Graver, Cousins & Co., Ltd.—Private company. Registered April 4th. Capital, £255 in £1 shares (250 5 per cent. cumulative preference and 5 ordinary). Objects:—To carry on the business of electrical, lighting, heating, ventilating, wireless, mechanical and general engineers and engineering contractors, &c. The subscribers (each with one share) are:—C. H. Cousins, 58, Mount Gold Road, Plymouth, general clerk; C. H. Pearn, 1, Spenser Terrace, Lipton Road, Plymouth, builder and contractor; H. F. Cousins, 58, Mount Gold Road, Plymouth, electrician; J. Graver, 27, Burleigh Park Road, Plymouth, electrician. Secretary: C. H. Cousins. Solicitor: C. L. Croft, 13, Princess Square, Plymouth.

Official Returns of Electrical Companies.

Nalder Bros. & Thompson, Ltd.—Capital, £30,000 in 15,000 preference and 15,000 ordinary shares of £1 each. Return dated December 29th, 1926. 12,000 preference and 11,881 ordinary shares taken up. £13,881 paid. £10,000 considered as paid. Mortgages and charges, £5,738.

Vaca Falls Co., Ltd.—Capital, £50,000 in 15,000 preference and 35,000 ordinary shares of £1 each. Return dated December 31st, 1926. 5,000 preference and 35,000 ordinary shares taken up. £25,000 paid. £15,000 considered as paid. Mortgages and charges, nil.

Townlea Electrical Co., Ltd.—Capital, £1,000 in 300 preference and 700 ordinary shares of £1 each. Return dated January 11th, 1927. 500 ordinary shares taken up. £500 considered as paid. Mortgages and charges, nil.

Sussex Electricity Supply Co., Ltd.—Capital, £20,000 in £1 shares. Return dated December 8th, 1926. 18,049 shares taken up. £18,049 paid. Mortgages and charges, £10,000.

English Freeholds and Industrial Undertakings, Ltd. (formerly Water, Gas and Power Undertakings, Ltd.).—Capital, £4,000 in £1 shares. Return dated December 31st, 1926. 1s. per share called up. 700 shares taken up. £35 paid. Mortgages and charges, nil.

John Richards & Co. (Electrical Engineers), Ltd.—Capital, £6,000 in £1 shares. Return dated March 18th, 1927. 4,802 shares taken up. £2 paid. £4,800 considered as paid. Mortgages and charges, nil.

London Electric Stores, Ltd.—Capital, £1,000 in £1 shares. Return dated March 2nd, 1926 (filed January 1st, 1927). 750 shares taken up. £750 considered as paid. Mortgages and charges, nil.

Power and Traction Finance Co., Ltd.—Capital, £250,000 in £1 shares. Return dated January 14th, 1927. 6,002 shares taken up. £6,002 paid. Mortgages and charges, nil.

Credenda Conduits Co., Ltd.—Capital, £50,000 in £1 shares. Return dated January 14th, 1927. All shares taken up. £30,000 paid. £20,000 considered as paid. Mortgages and charges, nil.

Simmonds & Stokes, Ltd.—Issue on March 29th, 1927, of £50 debentures, part of a series already registered.

Rangoon Electric Tramway and Supply Co., Ltd.—Satisfaction to the extent of £9,528 on December 29th, 1926, of debenture stock dated February 1st, 1906; December 22nd, 1908; November 5th, 1913; and January 25th, 1924, securing £250,000.

Electric Supply Co. of Victoria, Ltd.—Satisfaction in full on June 30th, 1925, of debenture stock trust deeds dated July 7th, 1905, and May 9th, 1907, securing £160,000 and £40,000 respectively.

Small Electric Motors, Ltd.—Satisfaction in full on March 15th, 1927, of mortgage dated October 29th, 1918, securing £2,500.

Hellyar & Sons, Ltd.—T. H. Hellyar, of 169, Church Road, Barnes, was appointed receiver and manager on March 11th, 1927, under powers contained in mortgage dated August 23rd, 1912.

English Electric Co., Ltd.—Satisfaction to the extent of £35,000 on February 24th, 1927, of first mortgage debentures, secured by trust deed dated September 15th, 1919, securing £1,000,000.

W. P. Love & Sons, Ltd.—Mortgage on certain freehold land, fixtures, &c., at Brenchley, Kent, dated March 24th, 1927, to secure all moneys due or to become due from the company to the National Provincial Bank, Ltd.

City Notes.

Babcock & Wilcox, Ltd.

The report for the past year records a net profit of £716,576; to this is added £188,774 brought forward, making £905,350. It is proposed to transfer £150,000 to the reserve fund (making £702,000) and £20,000 to the staff pension fund, and to pay a final dividend of 8 per cent., free of tax, on the ordinary shares (the interim dividend was 5 per cent.), leaving £161,442 to be carried forward. The death of Sir James Kemnal, the managing director, is recorded, and it is stated that during the year Sir Coles Child, Bt., and Mr. H. W. Kolle joined the board. Extensions were made to the factories and plant at Renfrew and Dumbarton, but the increased production which should have resulted was prevented by the general strike and coal stoppage. Considerable loss to the company and inconvenience to customers were caused by these disputes. The associated companies in this country and abroad were profitable in the aggregate. The Spanish company was fully employed, the French company paid a good dividend, and the German company has been well employed and has increased its dividend. The Italian company has not yet had time to develop fully and meet the unusually severe competition in Italy. The Japanese works have progressed and their extension is contemplated. The Australian works are now working under more favourable conditions; considerable progress has been made and large contracts are in hand. The Canadian company has suffered from the trade depression in Canada, but there are signs that the long overdue improvement is about to take place. Business in China is, of course, at a standstill. The advances in design have caused unusual demands on the staff during the year, but the company has demonstrated its ability to meet all its customers' requirements. The meeting is to be held on April 20th.

Metropolitan-Vickers Electrical Co., Ltd.

The 27th annual meeting was held on April 5th, Major-Gen. Sir Philip Nash presiding. In moving the adoption of the report, the chairman said that the profit for the year showed an increase of £3,153, which might be considered satisfactory in view of the industrial interruptions during the year. The actual output from the works during 1926 was slightly less than in 1925, which was a record year for the company, but bearing in mind the dislocation and interruption to industry which the coal dispute caused, the result was good. Moreover, relations between their workpeople and the management continued to be of the most cordial nature throughout the whole period. They experienced, however, during the prolonged coal stoppage considerable difficulty in obtaining certain classes of raw material essential to their business, and the general conditions which prevailed rendered the task of maintaining output abnormally difficult. Due to those industrial conditions in 1926 the home market for electrical plant, &c., was adversely affected, but towards the end of the year they were fortunate in obtaining a fairly large amount of business which brought the value of orders for the home market in 1926

nearly up to the total of the previous year. On the other hand, they had a considerable increase last year in orders obtained in the overseas markets, and measured in terms of tonnage the export orders obtained by the company last year were far in excess of any previous year in the company's history, though the prices obtained were barely remunerative. At the same time the obtaining of a large volume of work in the export market was essential to the well-being and progress of the company, and looking back over a term of years in which they had consistently carried out a policy of expanding their export business, he had no hesitation in saying that the results had fully justified the policy. Referring to the Central Electricity Board, he said that its work would be watched with close interest by all connected with the electrical industry, and he trusted that whatever might have been the opinions or criticisms of the Bill during its passage through Parliament, all sections of the industry would now combine to assist the Board to make the new Act a success. All were agreed that our country was behind other countries in the use of electricity, and the new Board, by an active and well-considered policy, had a great opportunity before it to undertake developments beneficial alike to the industry itself, and to the country as a whole. One of the important works which the Board would have to carry out was the installation of apparatus in connection with the high-pressure transmission lines contemplated in this country, a work which was outside the more standard lines of apparatus hitherto utilised in this country. The experience which their company had gained in the export field rendered it peculiarly adapted to undertake this class of work. Speaking of some of the larger contracts which were under process of being carried out by the company, he said that for the home market they were manufacturing large power house equipment for the Bristol and Liverpool Corporations. They were manufacturing to the order of the Manchester Corporation the largest turbo-generator set that had ever been installed in Great Britain. The new set was of a capacity of 40,000 kW, which would be installed at the Corporation's power station at Barton, which already contained three 25,000-kW sets of their manufacture. Their railway electrification business continued to expand, and in addition to a large order from the Southern Railway in this country, they were also manufacturing traction equipment for India, Brazil, Australia, South Africa, Spain, Czecho-Slovakia, Italy, Holland, and Argentina. They also had under manufacture at the present moment large pieces of heavy generating plant for New Zealand, Sydney Corporation, Shanghai, Rumania, and Russia, and other important contracts for h.p. apparatus of the most modern design for Argentina, Rhodesia, New South Wales, and other countries. He had referred earlier to the good relations which existed between the management and the workers. They had at their Trafford Park works a Works Committee, which had been operating for the last ten years, and the key-note of whose work was to create the right spirit in their workshops. That committee was composed of 15 delegates of the workmen drawn from the various departments of the works, and elected by the workmen themselves. In addition, four representatives of the management and one senior foreman served on the committee. The committee elected its own chairman each year, and it was interesting to record that for the last seven years the chairman of the committee had been one of their workers—Mr. Sam Ratcliffe—a man who was held in the highest respect by all ranks in the company, and was one of the trade unionists selected to visit America last year with the *Daily Mail* Mission. There was no question at all to his mind that the works committee was as necessary and as important a section of organisation as any in the company. They also had a staff committee and a women's committee. In another direction the company also endeavoured to make the conditions of its workers as attractive as possible, and with this object they had for many years had in operation a system of payment by results whereby the workers employed could earn without restriction substantial increases on their basic rates, depending on output. At the present time about 86 per cent. of the workers employed by them participated in those arrangements. Referring to the future, he said they commenced this year with a satisfactory volume of orders on their books, and, together with those which they might expect to obtain in the ordinary way during the year, their manufacturing facilities should be well occupied, provided there were no industrial or other interruptions. He did not see that the home market was, in the near future, likely to provide as much business as they had hoped it would do. It was clear to him that industry was recovering from the effects of the coal strike at a slower rate than was generally anticipated, and that at the termination of the strike, opinions generally were too optimistic. On the other hand, he saw no reason why conditions should not gradually improve so that later in the year this market might regain its former activity. In the meantime they would continue their activities in the export market which offered promise. Competition, however, in this market was as severe as ever, and it was there that the British manufacturer felt most the greatly increased costs arising from taxation. In addition to the increased burdens of national taxation the company was paying nearly three times as much in local taxation as it paid in 1914. He renewed the plea which industry made to the Government to enforce economy in national and local expenditure.—The report was adopted without discussion.

Automatic Telephone Manufacturing Co., Ltd.

Sir Alexander Roger presided at the annual meeting on April 7th, and in moving the adoption of the report and accounts (Elec. Rev., March 18th, p. 445), referred to the death of Sir J. S. Harmood Banner. He said that although the profit for the year appeared to be slightly lower, it was in fact higher owing to the disappearance of an item of debenture interest. Notwithstanding the difficulties of the past year, the company had achieved the largest output in its history, and although it was not yet working to the limit of its extended capacity, the prospects of the current year were encouraging. Referring to the company's contracts for the conversion of London telephones to automatic working, he said that it was hoped to introduce the service in the coming autumn. In addition to the progress made in London, the company had completed automatic exchanges at Shrewsbury, Gosport, Hayling Island, Ipswich, Cheltenham, Cosham and Marton, besides two manual exchanges at Weston-super-Mare and Upton. Considerable progress had also been made with the automatic equipment for Southport and Nottingham. In addition to those home contracts, several overseas orders had been completed, including those from Buenos Aires, Tokio, Sydney and Canberra (the Australian Federal capital). They had continued to receive valuable assistance from the Automatic Electric, Inc., Chicago, the pioneers of the Strowger system, which was now represented by over 3,000,000 stations. In the foreign market the company had demonstrated its ability to compete successfully in quality and price with the rest of the world. Dealing with the domestic apparatus branch of the business, the chairman said that the coal dispute had stimulated the demand for electric heating and cooking appliances and the company had secured a good share of the business. All steps were being taken to increase sales further by the improvement of the existing appliances as well as the production of new ones. The demand for their telegraph products maintained a steady level, but the mine-signalling branch naturally suffered. The company had developed a sub-station automatic control system; four examples of that system had been installed for Colonial railways, and several comparatively large schemes were under consideration. The building extensions had been completed, and those and the constant introduction of improved methods maintained production at a high level of efficiency. In conclusion, Sir Alexander referred to the work of the Telephone Development Association, the training of students at the works, and employés' welfare.

International Automatic Telephone Co., Ltd.

The annual meeting was held on April 8th. Sir Alexander Roger presided, and in the course of his speech dealt with the progress which had been made by the Automatic Telephone Manufacturing Co., Ltd. He said that it was seven years ago since the company undertook the exploitation of the foreign business of the manufacturing company and during that period a substantial business in many important centres abroad had been secured. The chairman then referred to the proposal to cancel the option which Messrs. Theodore Gary & Co. held on the issued preference capital of the company. (This was outlined in our issue of March 25th, p. 485.) He said that Messrs. A. F. Adams, Theodore Gary, and H. L. Gary (all American directors) had resigned from the board, being unable to give sufficient time to the company's business, although they promised the continuance of their support. Mr. H. L. Harris (a director of Theodore Gary & Co.) and Mr. G. W. Moore (manager of the Automatic Telephone Manufacturing Co., Ltd.), had been appointed to the board. Sir Alexander then dealt with the work of the Telephone Development Association and claimed for it a substantial part of the 8-11 per cent. increase in telephones during 1926. In conclusion, the chairman said that the A.T.M. Co. had invited the company's staff to participate in the benefits of the pensions fund, and arrangements were being made to give effect to that. The report and accounts were adopted, and at a subsequent extraordinary meeting resolutions were approved giving effect to the cancellation of the option upon the preference shares referred to above.

St. James' and Pall Mall Electric Light Co., Ltd.

The annual meeting was held on April 5th, Mr. G. W. Balfour (chairman) presiding. In presenting the report and accounts (Electrical Review, March 25th, p. 486), Mr. Balfour first referred to the death of the late chairman (Mr. Walter Leaf); to the resignation of Sir A. B. W. Kennedy from the position of chief engineer; to the appointment of Messrs. Andrews and Rowland as joint engineers; and the election of Mr. C. P. Sparks to the board. Turning to the accounts, he explained the altered form adopted, and said that the cost of energy had increased owing to the coal dispute, and the rates had also risen to a large extent. Special charges had to be met on account of the general strike, but absolutely no interruption had occurred in the supply. Owing to the reduction in the tariff, &c., the revenue had fallen by £11,000, although the sales had risen by 2.41 per cent. The growth of the demand was satisfactory. In the Regent Street and other areas additional converting plant and mains were being installed. Mr. Balfour then referred to the handing over of the Grove Road station to the London Power Co. The Central Co., he said, would continue as a separate entity; it had capitalised and distributed £225,000 of its free reserves in the form of £5 ordinary shares between the St. James'

and the Westminster Companies; in the case of the former the amount thus received was included in its free reserves and formed part of the £440,000 capitalised last year. They looked to the London Power Co. to effect economies in generation. A pension fund had been established for the employés, and to it the company had transferred £30,000 fully paid £1 ordinary shares. The report and accounts were adopted.

Metropolitan Electric Supply Co., Ltd.

Mr. G. Balfour, M.P. (deputy-chairman) presided at the annual meeting in the absence, through illness, of the Chairman, Mr. A. W. Tait. In presenting the report (*vide* Elec. Rev., April 1st, p. 528), Mr. Balfour referred to the altered method of producing the accounts, and said that they had a contract for nine years with the London Power Co. to take their requirements for the London area in bulk. With regard to the Western area, they were free to make their own arrangements. In the latter area they operated under a special Act enjoying perpetual tenure for the supply of electricity in bulk. They also owned the Uxbridge, Chesham and Brentford undertakings. The active policy of expansion adopted by the directors was indicated by the fact that during the past four years, £642,815 had been spent on mains and distributors. During the current year, £64,000 would be spent in the London area and £183,000 in the Western area for similar purposes. The output during the year was 84,800,000 kWh, of which 51,200,000 kWh was supplied to the Western area. The increase in business was larger than the increase in revenue indicated, for reductions amounting to £46,000 were made to consumers. Mr. Balfour quoted figures to show that during the past year no advantage had been gained by the company under the altered conditions. Other figures presented showed that the increase in gross receipts during the last five years had been a little over 2 per cent. in the London area and 200 per cent. in the Western area. After referring to the exchange of the 3½ per cent. mortgage debenture stock for Government loan stock, Mr. Balfour said that notice had been served on the holders of the 5 per cent. extension debentures that these would be redeemed on April 1st. The dividend paid for last year amounted to 12 per cent. on the original capital as against 11 per cent. for 1925. In seconding the motion for the adoption of the report, Mr. G. Verity said that the publicity given to the new Electricity Act had stimulated the sale of energy, and the company had experienced an increased demand from domestic consumers; the board was encouraging the growth of that business by the introduction of a two-part "all-in" tariff. The report and accounts were adopted.

Newcastle-upon-Tyne Electric Supply Co., Ltd.

The annual meeting was held on March 29th, Mr. R. P. Sloan, C.B.E. (chairman) presiding. In presenting the report (*vide* Electrical Review, March 25th, p. 486), the chairman said that 1926 was the worst year that the North-East Coast had ever experienced. At the commencement of the coal stoppage the company had three months' supplies in stock; during the remainder of the period, in preference to buying foreign coal, they had purchased locally supplies of cheap coal, some of which had been lying about for 50 years. They had taken less than 50,000 tons from abroad. There was a serious reduction in output, but an immediate recovery when work was resumed at the mines. The stoppage involved the loss of the waste heat with which they generated much energy, and working costs were increased all round. Since 1914 local rates paid by the company had increased by 516 per cent., while the capital had only risen by 156 per cent. The amount paid was about sufficient to pay a dividend of 1½ per cent. on the ordinary shares. There seemed to be no prospect of relief from that burden. During the past year the new connections amounted to 30,762 h.p.; the proportion of that represented by domestic supplies far exceeded anything experienced before. They had only aimed at connecting up 12,000 new consumers, whereas the actual number connected was over 16,000. It had been thought prudent to reduce the amount transferred to reserve, and although the dividend was reduced from 7 to 5 per cent., it was paid on a larger capital and could not be considered unsatisfactory. Capital expenditure during the year totalled £413,655. A considerable portion of that had been spent on h.p. transmission and the 66,000-V system between the Tyne and Tees areas had been completed; £79,147 represented expenditure upon generating station plant. Dealing with the prospects of the current year, Mr. Sloan said that there had been a considerable revival, and they could look forward with some degree of confidence. At the beginning of the year they had orders for a further supply representing 25,331 h.p., and 2,840 new domestic consumers had been connected. It was hoped to occupy the new offices before the end of the year. The report and accounts were adopted.

City of London Electric Lighting Co., Ltd.

The annual meeting was held on April 6th. Mr. J. B. Braithwaite presided, and in moving the adoption of the report and accounts (Elec. Rev., April 1st, p. 527), said that the condition of electricity supply in this country had reached a definite and important stage. The effect of the London Electricity Acts, 1925, was to define the position of the London companies and get rid of the vagueness and uncertainty which prevailed. The companies were bound down to certain charges and dividends; in their own case they had decided to adopt the 1922 dividend as a standard, and that would remain in force until 1932. They were also entitled to retain—if they could earn it—a sixth of the difference between the standard price and the actual sums charged to consumers, and the employés were entitled to a similar amount under a co-partnership scheme. Already the power stations of the East End group of companies had been connected in accordance with the provisions of their Act. With regard to the Electricity (Supply) Act, 1926, Mr. Braithwaite said that that measure should result in a general impetus in the use of electricity; there was a boundless field open for the supply of electricity if it could be made reasonably economical to employ electrical appliances. Although the company's sales of energy had increased by about 4,000,000 kWh during 1926 the revenue was over £20,000 lower; that was due to the reductions made in the charges to consumers. The results of the first quarter indicated that the year was going to be a prosperous one. The company was capitalising £400,000 of the reserves and each ordinary shareholder would receive a bonus representing 50 per cent. of his holding. That, of course, would not make any difference to the actual amount of dividend received.

South London Electric Supply Corporation, Ltd.

This company's accounts were reviewed in our issue of April 1st. (p. 528). Sir Harry Renwick, K.B.E., presided at the annual meeting on April 5th, and explained the alterations effected by the London Electricity (No. 1) Act, 1925. He said that the standard price and dividend had not yet been settled, and £33,874 was carried forward. The capital expenditure during the year was heavy owing to the installation of new mains to take additional supply in bulk from the County of London Co., but the money had been well spent. In spite of the troubles of the past year the sales had increased by 750,000 kWh, and the number of new consumers had shown a satisfactory rise. Referring to the new Electricity (Supply) Act, Sir Harry said that at no time was the company hostile to it, but every assistance was rendered to make it a workable and useful measure. The Act as passed was a marked improvement upon the Bill as deposited, and should give a tremendous impetus to the demand for electricity supply. The Act had possibilities for conferring untold blessings on the industry, and the Central Board would have the wholehearted support of the company. Dealing with the reorganisation of the London electricity supply industry, the chairman said that the company was now taking practically the whole of its supply in bulk from the County of London Co., and it was hoped that that would have a good result in the accounts. A considerable sum had been written off in respect of machinery which would not now be required. The prospects for the current year were good, and the progress made so far was excellent. The shareholders now had a gilt-edged security—a thoroughly sound investment for the next forty years. The report and accounts were adopted.

Para Electric Railways and Lighting Co., Ltd.

Sir Francis M. Voules, C.B.E., presided at the annual meeting on April 5th, and in the course of his speech said that the revenue from both tramways and power had improved and that, combined with a higher exchange rate, had increased the sterling gross receipts by nearly 42 per cent. It was expected that the current year would compare favourably with that under review, although the majority of British public utility companies operating in Brazil would feel the effect of the low rate at which the milreis had been stabilised (5⅞d.). There should, however, be a general improvement in trade which should bring greater income to the company. Just before the fall of the milreis to its present low value the new fares became operative; the uniform tariff was popular with their patrons and fair to themselves. The company had incurred expense upon the track and equipment, but it should earn a good return. He believed that the time was not far off when arrangements would be made to deal with the arrears of preference dividend; that had been retarded by the fall in the exchange.

Marconi's Wireless Telegraph Co., Ltd.

On April 7th an extraordinary meeting was held to confirm the resolutions for the reduction of the capital, &c., passed at the meeting on March 15th. Senatore Marconi presided and, in moving the confirmation, said that he had received a letter from Mr. Nordon's committee stating that it had been decided not to use the proxies at that meeting, but to make a protest when the proposals came before the Court. Mr. F. G. Kellaway seconded the motion, and Mr. Nordon then criticised the directors' proposals at some length. He contended that the resolutions before the meeting had not been passed effectively; a three-fourths majority had not been obtained. Dr. Sherlock (Dublin) supported the proposals on behalf of the Irish shareholders, and Major White also expressed his approval. Mrs. Farquhar Smith raised the question of the directors' remuneration and expenses, and Mr. Kellaway said that the figures quoted were greatly exaggerated. Eventually the confirmatory resolution was carried on a show of hands.

Bournemouth and Poole Electricity Supply Co., Ltd.

In moving the adoption of the report and accounts (Elec. Rev., April 1st, p. 528) at the annual meeting on April 7th, the chairman (Mr. J. A. Hosker) said that the output was

larger last year in spite of the coal dispute and general strike. The company had incurred extra expenses, but did not on that account increase its charges to consumers, although in March last year substantial reductions had been made. Dealing with the various items of expenditure, the chairman paid special attention to the amount of rent, rates and taxes paid, which, he said, was equivalent to 0.85d. per kWh. Rates, taxes and insurance absorbed £8,000 more than they paid for coal. Their efforts to reduce the costs by increasing the efficiency were largely negatived by the increase in those items. The business obtained so far this year was very satisfactory. In conclusion, he said that he had nothing further to report with regard to the acquisition of the undertaking by the local authorities.

London Electric Wire Co. & Smiths, Ltd.

The annual meeting was held on April 8th. Sir George H. Fisher-Smith (chairman), who presided, said that the company was in a very sound position. The troubles of the past year had reduced the output and lowered the profit by £12,437. The result was not unsatisfactory and was partly due to the provision of oil fuel in lieu of coal. The company's factories could have produced far more than they did in 1926, but the prevailing conditions restricted the amount of business available and the result was severe home and foreign competition. In conclusion, Sir George said that the Electricity (Supply) Act would not make itself felt for some time, but there was tremendous scope for development in this country.

Stock Exchange Notices.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Pinchin, Johnson & Co., Ltd.—17,500 ordinary shares of £1 each, fully paid, Nos. 522,501 to 540,000.

Shawinigan Water and Power Co.—72,816 shares of common stock of no par value.

The undermentioned have been ordered to be officially quoted:—

Ericsson Telephones.—99,980 (cumulative 7 per cent.) preference shares of £1 each, fully paid, Nos. 200,001 to 299,980.

Nigerian Power and Tin Fields, Ltd.

This company recently issued, for information only, a statement of its capitalisation and objects. It was formed on March 10th to generate and supply hydro-electric power to tin-mining companies and others operating on the Bauchi Plateau of Northern Nigeria. It is proposed to acquire a lease of the Kurra Falls (Gnar River) from the Nigerian Government for power purposes, as well as leases of other water and mining rights. The authorised capital is £500,000, of which the vendors, the Nigerian Base Metals Corporation, Ltd., are allotted £250,000, and will provide the working capital.

Richmond (Surrey) Electric Light and Power Co., Ltd.

Sir Harry Renwick, K.B.E., who presided at the annual meeting on April 7th, opened his speech with a reference to the death of Sir James Szlumper. Turning to the accounts (*vide* our issue of April 1st, p. 528), he said that, although expenses were greater on account of the coal dispute, the gross profit was slightly higher. There had been an increase in connections and output, although the directors' anticipations had not been fulfilled. They could look forward to better results in the current year, however, particularly if the present improvement in the country's trade continued.

German Companies.

The *Felten & Guilleaume Company*, Cologne-Mulheim, recommends a dividend of 6 per cent. for 1926, as in the previous year.

The *Transradio Company for Wireless Oversea Communication* reports that the extensions and improvements carried out in 1925 worked well during the past year. Considerable progress was made in the transmission of news to great distances by means of short waves, and a special building was established to deal with this service. The total of transmarine telegraphic traffic again experienced an increase. The accounts show net profits of 1,372,000 marks, as against 1,371,000 marks, and the dividend remains at 8 per cent.

The *Bergmann Electricity Works Company*, Berlin, reports net profits of 3,155,000 marks, as against 2,599,000 marks in 1925. It is proposed to increase the dividend from 6 per cent. to 8 per cent. The directors state that since the middle of last year business has improved and promises to extend further in the current year. It is proposed to raise the share capital from the 33,000,000 marks nominal to 44,000,000 marks.

The *United Aluminium Works Company*, Lauta, which is the controlling undertaking in this branch in Germany, and whose share capital is held entirely by the Reich, reports net profits of 4,250,000 marks, as compared with 3,930,000 marks in 1925. It is proposed to raise the dividend from 7½ per cent. to 8 per cent. Special appropriations are made to reserve as it is intended eventually to change over to the electro-thermic process for the production of alumina, so that it will then be necessary to write off the existing plant. The investigation of the bauxite mines in Hungary has revealed the existence of large deposits, and for this reason purchases from the Italian mines have been discontinued.

Belgian Company.

The *Société des Constructions Electriques de Belgique*, Brussels, reports a net profit of 1,775,621 fr. for the last financial year, as compared with only 109,140 fr. in 1925.

Cork Electric Tramways and Lighting Co., Ltd.

The revenue for the past year amounted to £138,900, and after providing for debenture interest, transferring £15,000 to depreciation and renewals reserve and £5,000 to general reserve, and adding £9,455 brought forward, there remains a balance of £29,994. It is proposed to pay a final dividend of 5 per cent. on the ordinary shares, making 8 per cent. for the year (against 6 per cent.), and to carry forward £14,630. The expenses were increased by the coal dispute, but the increase was more than offset by the rise in revenue. Meeting: April 22nd.

La Plata Electric Tramways Co., Ltd.

From the profits of the past year £8,500 is transferred to reserve and £5,000 to renewals, while a dividend of 1¼ per cent. is paid on the preference shares in respect of arrears, in addition to the year's dividend. £1,116 is carried forward.

Indo-European Telegraph Co., Ltd.

The directors recommend a final dividend of £1 2s. 6d. per share, free of tax, making 7 per cent., tax free, for the year. In addition, a bonus of 15s. per share, free of tax, is to be paid. This distribution is the same as for 1925.

Shropshire, Worcestershire and Staffordshire Electric Power Co.

The directors recommend dividends at the rate of 8 per cent. and 7 per cent. on the "A" and "B" ordinary shares respectively in respect of the past year.

Major & Co., Ltd.

The dividend for 1926 has been declared on the 6 per cent. preference shares, but the directors are unable to recommend any distribution upon the other classes of shares.

Wood & Cairns, Ltd.

The directors recommend a dividend of 7½ per cent. on both preference and ordinary shares for 1926.

Stocks and Shares.

MONDAY EVENING.

STOCK Exchange markets look forward to what may be expected to happen after Easter. For there is little enough business doing in the markets just now. Business is affected not only by the close approach of Easter, but by the still critical condition of affairs in China. The Budget is not so bad as might have been expected. The enormous deficit facing the Chancellor in connection with the year just ended has been known, of course, for the past fortnight, and its magnitude caused a good deal of uneasiness in the City. The manner in which the Chancellor has met the crisis came as a pleasant surprise to the many people who feared he would call for most of the loss to be met by heavy additions to income-tax.

The prices of investment stocks and shares maintain a firm front. Notwithstanding all the outpouring of new issues that has occurred during the past three months, there remains plenty of money available for investment. This seems anomalous, having regard to the fairly high Bank rate of 5 per cent. that has ruled over the past 16 months and the industrial conditions current during nine months of 1926. Practically every company report which appears nowadays contains references to the coal stoppage and the General Strike, blaming both for curtailment of profit or for working at an actual loss which the disputes entailed.

Nevertheless, prices keep up, for the reason that investment regards the events of last year as impossible of recurrence, and looks forward, as is its wont, to better times in the near future. It is on this impression that substantial rises have been reared during the last few business days in the prices of Home Railway stocks. The Undergrounds have failed to benefit to any marked extent, Districts and Metropolitans continuing at the same levels as before, while the Underground £1 shares have receded a trifle on selling by profit-takers who wanted to get their books clear before Easter. The steam stocks are strong, on expectations that the holiday traffics will show up very well against those of a year ago, and the further consideration that, for the next few months, every week will contribute to the extraordinary recovery which is likely to occur in the Home Railway industry as compared with the corresponding period last year.

The market for electricity supply shares is a good one, and the rises which have recently been achieved by Metropolitans, County of London and others are well maintained. There is a fair amount of supply obtainable in the list of ordinary shares, but amongst preferences the choice is more limited, owing to the ready manner in which shares are absorbed when they come to market. Brokers are frequently

asked to buy shares of which, when the market is tested, no supply is found obtainable, and it may prove of service to set out some of the amounts now on offer, or which were on offer at the time these paragraphs were written, giving the yield and other particulars. We draw these from a useful list issued by one of the principal firms in the electric lighting market of the Stock Exchange.

Babcock & Wilcox are repeating the previously-paid 13 per cent. free of tax dividend on the ordinary shares, the net profit for 1926 of £716,600 contrasting with £785,000 in 1925 and £760,300 in 1924. The capital during the three years has remained unchanged at £4,576,712. The company's reserves now stand at £952,000, this including the dividend equalisation fund of £400,000. The extensions which were made to the plant, &c., did not fulfil the expectations formed of increased production owing to the General and Coal strikes. The figures in the balance-sheet are, however, very good, and the price of the shares has risen 1/16th to 53s. 9d.

Johnson & Phillips recovered to 47s. 6d., after having dipped to 46s. 3d. Amongst various shares marked ex dividend last week are British Aluminium, British Electric Transformer preference and Metropolitan-Vickers shares of both classes. The Telegraph Construction Company has declared a dividend making 10 per cent. for the year, the same as that for 12 months ago, and the Great Northern Telegraph dividend of 20 per cent. repeats the distribution paid for 1925.

The Marconi market is quiet, though a little disposition is noticeable to buy the shares of the subsidiary companies. Marconis themselves touched 18s. before reverting to 17s. 6d., at which the price appears to have settled down, and which it is thought may mark the probable level of the shares between now and the time when anticipation will start discussing the expected dividend. In the cable group, the changes are mostly upwards. Westerns have risen to 17, and Eastern ordinary, ex dividend, is 172½, recovering part of the deduction made last Thursday, the Stock Exchange pay-day. Automatic Telephones are weak, the price giving way to 48s. 9d., and this in its turn influenced Internationals, which are a somewhat dull market at 2 1/16. The deferred stand about 1s. less. Telephone Manufacturing have hardened a trifle to 7s. 3d.

The list of home and foreign tramway stocks is quiet and somewhat uninteresting. Brazilian Tractions fell a point; Barcelona Tractions, on the other hand, keep good at 48. Anglo-Argentine Tramways preference shares are steady, in spite of a rumour to the effect that the expected settlement between the company and the Buenos Aires municipality is by no means reached even yet. The report of the La Plata Tramways shows the company to have turned the corner after a good many years of unprofitable working. The dividend of 6 per cent. on the preference shares is to be met, plus 1½ per cent. on account of arrears, which at the moment stand at 71 per cent. The price of the preference is 20s. 6d. cum eighteenpence dividend, and a little speculation has developed in the ordinary, which stand at 4s. 1½d.

Some little talk has arisen, as mentioned here before, of low-priced tramway shares offering scope for speculative possibilities. Nobody would think of buying the shares as a serious investment, but, taking the ground that the L.C.C. has far too much money locked up in tramways for the Council to abandon the latter altogether, it is contended that the day must come when, agreement having been reached on traffic control, the London tramways will be taken seriously in hand and set upon a paying basis. This is the reason that inspires a little inquiry for such shares as London United Tramways ordinary and preference, London and Suburban Traction ordinary and preference, and one or two others. There is not much market in these shares, and anybody who buys them does so in the full expectation of having to put them away for some considerable time, the aim being not so much a present profit of a shilling or so per share, but of doubling the money in days to come. For people who like this kind of speculation, it must be admitted that the low-priced tramway shares hold a certain amount of attraction, but clearly they are not for the widow or for the orphan.

Pennsylvania Water and Power shares are 5 dollars higher at 194½: Mexican Light and Power first mortgage bonds shed 3. The Rubber share market is quiet and featureless. Iron and steel descriptions show a harder disposition, on the hope of more favourable trade in the ensuing months of this year.

French Industrial Progress.

The Export Position Strengthened.

THE Department of Overseas Trade has recently published a report (through the Stationery Office, 7s. 6d. net) upon the economic and industrial conditions in France, 1925-26, by Mr. J. R. Cahill, Commercial Counsellor at the British Embassy, Paris.

The introduction to this report deals with the recovery of France from the effects of the war, with particular reference to the reconstruction of the devastated provinces. This reconstruction has been assisted by the employment of efficient up-to-date machinery; in the mining industry, especially, the equipment has permanently enhanced efficiency. The shortage of agricultural labour has been met by the "importation" of foreigners and by State aid for the installation of electricity in rural districts—a movement which is making immense progress. State aid has also been accorded to the great electrification schemes of the Paris-Orleans and Southern Railways. The supply of electricity is being universalised by the co-operation of private persons and public authorities, and the eventual realisation of the great Rhône and Rhine canal and water-power schemes and other projects held in abeyance through lack of funds will further endow permanently the national economic equipment. The introduction includes a table showing the advance made since 1913 in the direction of plant and equipment. The increase in generating capacity is indicated. Hydro-electric installations have risen from 647,000 kW in 1913 to 1,900,000 kW in 1926; and "thermic" stations from 1,000,000 kW to 3,500,000 kW. The electrified mileage of the railways rose from 153 in 1913 to 820 (estimated) in 1926.

A large portion of the report is devoted to the financial situation and the efforts of the Government to stabilise and restore the currency are dealt with. Other matters which receive attention are the proposed tariff revision (a translation of which was recently published by the Board of Trade), trade fairs, commercial treaties, &c.

The Electrical Industries.

Mr. Cahill says that the French engineering industries, which are stated to employ a total of 800,000 workers, have, with few minor exceptions, enjoyed full prosperity during the last eight years, broken only for a time in 1920-21. The automobile and electrical industries together probably employ half of the total number of workers and have had a brilliant course. The transformation brought about during the war has placed France in the front rank of industrial countries, an evolution which is testified to by the expansion of engineering exports. As regards the electrical branches, while the railway electrification and hydro-electric programmes were not proceeded with so rapidly as had been anticipated, owing to financial stringency, steady progress was made. The general advance in the utilisation of electricity in factory, farm, office and home, however, provided ample compensation. Out of a total of 38,000 communes in France, the number supplied with electricity has grown from 2,000 in 1911 to 6,820 in 1918, 8,200 in 1922, and 16,000 in 1926. The consumption per head of population has been increasing at the rate of 15 per cent. per year. In Paris itself the consumption (140 kWh per head) represents an increase of 370 per cent., as compared with 1913. The consumption in Lyons is 516 kWh, in Marseilles 216 kWh, in Strasbourg 230 kWh, and in Annecy 630 kWh. The advance of radio has also afforded much additional employment to the industry, and the development of the telephone services has had a similar effect. In foreign trade France has made astonishing progress. According to the French Federation of Electrical Associations, the share of France in the international trade in electrical material rose from 6 per cent. in 1913 to 11 per cent. in 1924. That of Germany had diminished, that of Switzerland had slightly increased, and the share of the United States had increased by 50 per cent. In actual figures, French exports rose from 10,400 tons in 1913 to 16,700 in 1923, and 23,600 in 1924. There was a fall to 20,200 tons in 1925, and the total for the first nine months of 1926 was 15,460 tons. The fall is said to be due to the shortage of labour and the keen home demand.

The capital invested in the electrical industries is computed at 8 milliards of francs. The leading position is held by the supply industry with an investment of 5 milliards. In the manufacture of electrical material the capital employed is stated to be 2.2 milliards. The heavy material branch shows a capital of 400 millions, and an annual output valued at 350 millions. The light material branch raised the value of its output from 45 millions in 1913 to 250 millions in 1925, and its exports increased five-fold during the same period. The value of the output of accumulators and dry batteries is five-fold (100 million fr.) for that of 1913, and of exports four-fold. The output of porcelain insulating material rose from 5,000 tons in 1913 to 20,000 tons in 1925. The comparatively new radio industry has an investment of 250 million francs.

A table showing France's foreign electrical trade indicates that the imports rose from 7,600 tons in 1913 to 7,800 tons in 1925; and the excess of exports over imports from 2,600 to 12,400 tons.

Electricity Production and Distribution.

At the beginning of 1925 the total installed capacity was put at 5,042,108 kW (3,228,848 kW "thermic" and 1,813,260 kW hydro-electric). Of the latter there were officially stated to be 213 stations with a power of 1,000 kW or over, representing a total of 1,263,260 kW, and 42,000 stations of less than 1,000 kW making up the balance. The normal capacity of the large stations was given as 683,750 kW. As expressed in h.p., an official return assigns, out of a total of 2.4 million h.p., 1.35 million to general distribution, 0.85 million to electrochemical and electrometallurgical industries, 0.1 to traction, and 0.1 to miscellaneous uses. The increase of one million h.p. since 1914 is almost entirely due to the creation of large stations. France now ranks second to Italy in the list of European hydro-electric countries, but development in Italy is proceeding more rapidly. Among the thermic stations there are at least 11 with a capacity of over 50,000 kW, of which five are in the Paris area (including Gennevilliers—340,000 kW). The principal developments in this direction have taken place in the north of France. In 1926 France possessed 7,000 miles of e.h.p. and h.p. lines. The State has spent nearly 200 million fr. on the distribution of electricity in the devastated areas.

Reverting to hydro-electric power, it is estimated that the potential water power in France amounts to 10 million h.p., of which 5 million h.p. is in the Alps, 2 million in the Pyrenees, and 2 million in the Central Plateau, Eastern France, and the Jura. Schemes are in hand for the development of 330,000 kW, of which 90,000 kW can be in operation by January 1st, 1928. Owing to the tightening of money and the more plentiful supply of coal construction has slackened and little progress has been made with certain of the larger schemes. In 1925 State assistance to the extent of 10,800,000 fr. was given to water-power projects.

Railway Electrification.

The report says that slow but steady progress has been made in the electrification programmes of the two railways which have definitely adopted the policy of electrification on a large scale, namely, the Paris-Orleans and the Midi (Southern) Railways. The Paris-Lyons-Mediterranean Railway appears to be confining its construction to the Culoz-Modane line (84 miles). Electric trains are now operating on several sections of the Paris-Orleans line and the company's auxiliary, the Union Hydro-Electrique, has opened its 80,000-kW station at Eguzon. The Midi Company has completed two long stretches, Toulouse-Dax and Bordeaux to the Spanish frontier and several branch lines. Three power stations in the Western Pyrenees and three in the Eastern Pyrenees, out of five and seven, respectively, are now in operation. The programme of the three railway systems mentioned provided for the electrification of about 2,000 miles in each case. At the date of the report the following proportions had been executed:—Midi, one-third; Paris-Orleans, one-eighth; and Paris-Lyons-Mediterranean, one-twentieth. In addition to these many smaller lines have undertaken electrification.

Telephones and Radio.

The latest figures available show that the number of telephone subscribers in France had risen from 310,000 in 1913 to 635,000 at the end of 1924. Many improvements and extensions have recently been effected. In April, 1926, an underground cable between Paris and Strasbourg (494 km.) was opened; this was to be followed by cables connecting Paris with Rouen, Havre, Lille, Lyons, and Marseilles.

A great deal of work has been done in the direction of linking up France with her colonies by means of radio-telegraphy, and a number of important stations are now working, while others are in hand. With regard to broadcasting, the report states that the number of persons with receiving sets is large and increasing.

General.

Among other matters, the report refers to the rapid development of the French aluminium industry, and says that the home demand is still greater than the output. Rapid progress has also been made by the electrochemical and electrometallurgical industries, which at the beginning of 1926 had an estimated capital of 1,155 million fr. Reference is also made to the proposed revision of the tariff; pending this the Government made two increases of 30 per cent. in specific duties during 1926, while *ad valorem* duties were left unaltered. (Since the report was issued the Board of Trade has published a translation of the proposed new tariff.)

A Railway Signalling School.

The newly-established school of the London Underground Railways at South Kensington, which is equipped with all types of electric signalling apparatus at present in service.

A SCHOOL for the training of signal linemen, fitters, and installers of the London Underground Railways has recently been established at South Kensington, Piccadilly Line, where classes are held and opportunities afforded for voluntary technical and practical training. The school, which is accommodated in a tunnel adjacent to the station, is laid out part as a laboratory and part as a lecture room, the latter having a capacity for about 60 students. The laboratory is equipped with every class of signalling apparatus actually employed on the railways so as to represent as nearly as possible actual working conditions.

A miniature track has been arranged over a bench running the whole length of the room, fig. 1. To this track is connected track-circuiting apparatus standing on the bench below, so that the whole is completely exposed for inspection and demonstration. On the left of the gangway running in front of the bench are arranged signals and train stops controlled from the miniature track, the whole representing a length of line equipped for automatic signalling. Five different types of track circuit are installed to work in conjunction with the miniature lay-out, and the whole shows clearly the operation of the signals corresponding to the positions of the trains on the line. The track circuits include the following types: diagram, condenser-feed, resistance-feed and impedance-bond, all for a.c. operation and working in conjunction with various types of signals.

One end of the room is fitted up to represent a signal cabin complete with a 7-lever power frame and illuminated diagram, fig. 2. The frame controls five signals and one pair of points;

Fig. 1.—Signal School, showing Miniature Track.

a king lever is fitted, which, when reversed, allows certain of the signals to work automatically. The various relays working in conjunction with the signals controlled from the power frame are exposed for inspection, and the whole of the apparatus is wired up and operates exactly as in actual service.

A length of full-size permanent-way, fig. 3, runs along the school on the lower level, and in conjunction with this signals and apparatus are fitted in the same manner as on the railways. The permanent-way is complete with a pair of points, to which a full-size point lay-out of the L.E.R. electro-pneumatic type is fitted. The layout is equipped with an escapement and a lock and detector box, and does not allow the signals reading over the points to be cleared if the switches are not closed to within $\frac{1}{8}$ in. of the stockrail in the right direction. This means that should the points become jammed through any foreign matter getting into the switches, the lever in the cabin would be held half-way over, the signal remaining at danger. This is carried out by means of a relay situated in the signal cabin and worked through the detector box on the points. An additional safeguard fitted to this layout is a special track lock which fixes the bolt of the points in the locked position so long as there is a train running over the track circuit in the vicinity of the points, thus preventing the possibility of the points being thrown whilst a train is

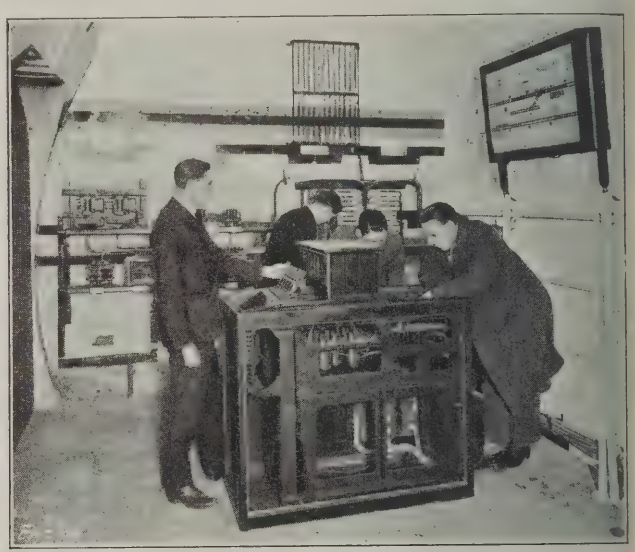

Fig. 2.—Signal Cabin.

passing over them. An a.c. electric point machine and controller is connected up so that it can be operated from a tumbler switch and the functioning of the machine watched.

Every type of track-circuit and other signalling apparatus employed on the railways is represented on the permanent-way.

An interesting feature of the equipment is an experimental track circuit for showing the effect of wet or dry weather on a track circuit. The apparatus is arranged in a tank and

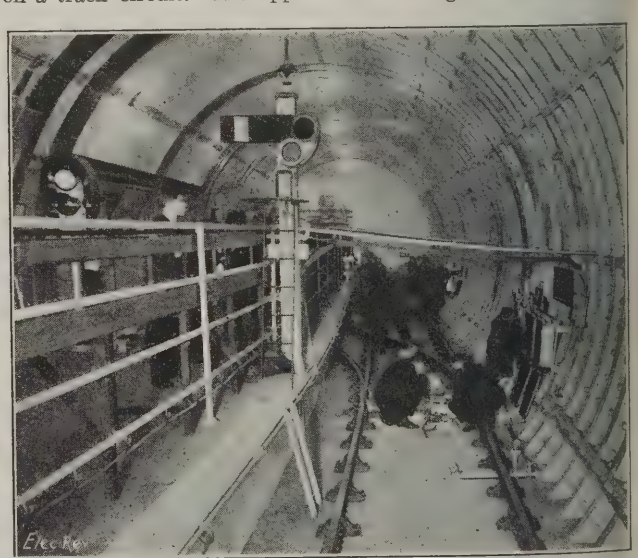

Fig. 3.—Permanent Way.

a number of wire tails hanging from a pair of "rails" vary the leakage resistance of the circuit according to the depth of water, representing various weather conditions.

Examinations are held at the end of each session, so as to gauge the progress of the students. The school is also used for the examination of each individual lineman before he is placed in charge of a section on the railways.

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

An Electric Safety Kettle.

A recent production of MESSRS. SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD., 38-39, Upper Thames Street, London, E.C.4, is the "Xcel" safety kettle. This is fitted with an automatic cut-out which breaks the circuit at a temperature a little above boiling point. The cut-out embodies a bridge contact which is normally held across two spring terminals by means of a fusible nut engaged with a screw in the kettle bottom. When the kettle runs dry the nut fuses and releases the bridge, which

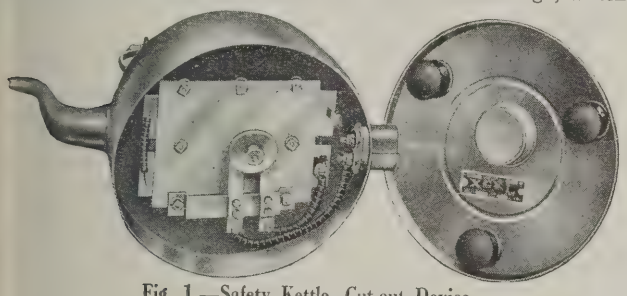

Fig. 1.—Safety Kettle, Cut-out Device.

is dropped into a small well pressed into the bottom cover. The break is assisted by a spring. A new collar can be screwed on without the aid of any tools, when the kettle is ready for service again. Each kettle is supplied with one spare fuse, and the cost of new fuses is negligible. Fig. 1 shows the automatic arrangement in the bottom of the kettle, the cover being removed. The appliance is made in capacities of 2¼ and 3¼ pints, with respective loadings of 650 and 800 W, and is made up in polished copper, nickel-plate or silver-plate.

An Electric Lawn Mower.

We illustrate in fig. 2 an electric lawn mower, the "Electra," which has been recently put on sale by MESSRS. RANSOMES, SIMS & JEFFERIES, LTD., Orwell Works, Ipswich. This is an entirely new model, and is fitted with a totally enclosed electric motor. The special features claimed for it are the independent drives to the cutting cylinder and land rollers, and the simplicity and ease with which it is operated. The cable is manipulated and controlled by a patented cable arm. The cable connection is similar to that for an ordinary electric fire or vacuum cleaner, and the motor is started by

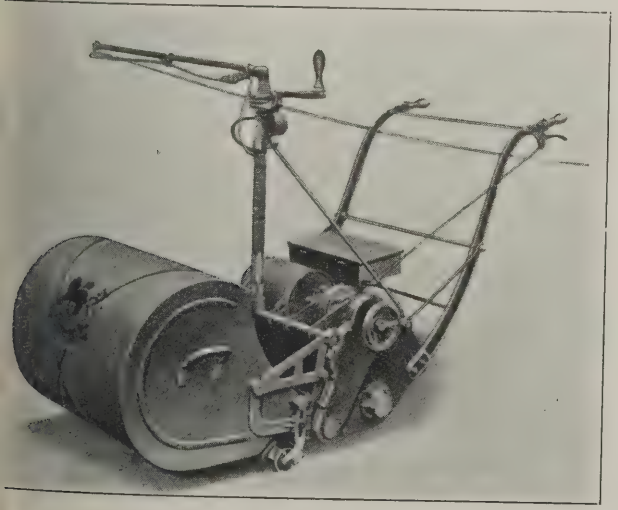

Fig. 2.—Electric Lawn Mower.

means of a simple switch. The machine is constructed with rolled-steel side-frames, ensuring, it is claimed, rigidness and efficiency in work on all classes of lawns. The high-speed cutting cylinder and the vibrationless electric drive should make this machine an ideal power mower for bowling greens.

A New Electric-Bell System.

In order to provide a means of using the ordinary signalling bell in conjunction with the electric lighting installation, without the introduction of expensive transformer apparatus, Mr. W. K. LEWIS, 54, Muswell Road, Muswell Hill, London, N.10, and Mr. A. J. ANIDO, 60, Chancery Lane, London, W.C.2, have brought out a new system which is intended to be installed at the same time as, and in conjunction with, the electric lighting system. Fig. 3 shows the arrangement for a simple system for a single bell (*g*) wired up with an indicator (*f*). One wire (*e*) only is employed for the bell which connects this, through the indicator, to a special 2-way switch or push (*c*) wired up in series with the ordinary lighting switch (*b*) on one way. The bell terminals

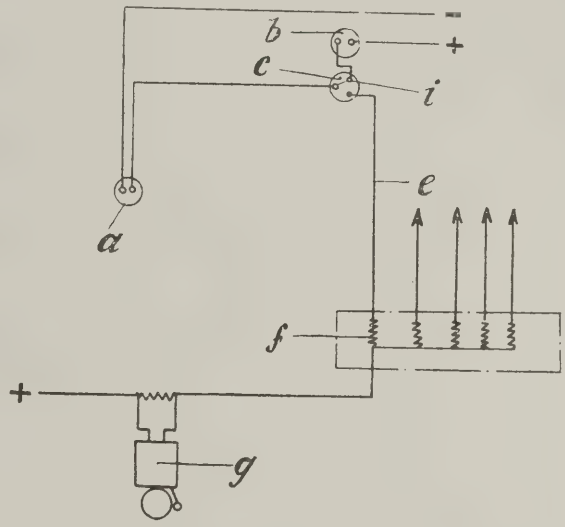

Fig. 3.—Novel Bell System.

are shunted so as to give a small volt-drop across the operating coil. With the 2-way switch in the lower position the bell shunt is put in series with the lamp (*a*) which indicates whether the bell receives the necessary operating current or not. The system is suitable for ordinary electric lighting pressures for which the wire and push are, of course, suitable. The indicator coil consists of only a few turns of low-resistance wire. It will be realised that the additional cost of the system over that for an ordinary bell circuit with batteries, the bell wire being drawn in with the lighting wires in the first place, is negligible.

An Improved Switch.

In our issue of September 17th, 1926, p. 479, we described a circuit breaker which had recently been introduced by MESSRS. J. G. STATTER & Co., Queen Anne's Chambers, Westminster, S.W.1. A modified design of this apparatus, which

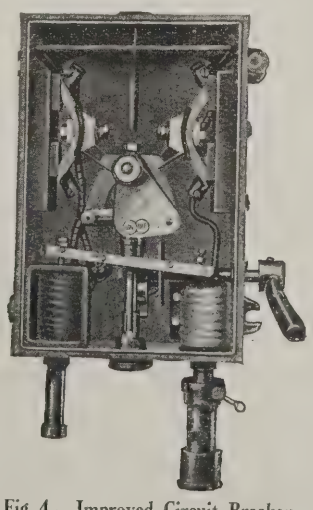

Fig. 4.—Improved Circuit Breaker.

still embodies the scissors movement of the laminated contact brushes, has now been produced, fig. 4. The main alteration is the provision of a side operating handle in place of a pull-down knob, enabling, it is claimed, the breaker to be more easily operated.

Electricity in Warships.

A survey of the applications of electricity on board British naval vessels.

By W. McCLELLAND, C.B., O.B.E., M.I.E.E.

(*Abstract of Paper read before the* Institution of Electrical Engineers.)

(*Concluded from page 576*).

Heating, Cooking and Baking.—Many types of electrical heating apparatus are being fitted in warships in increasing numbers, and in submarines general use is made of electrical methods as they are the only ones permissible when submerged. A standard radiator is used and electric fires of the imitation coal-fire type also are fitted in principal cabins and ward rooms. Two main types of elements have been standardised: the first consists of wire or tape wound on a mica former, and is intended for hot-plates, urns and kettles; the second consists of a coil of wire supported in a fireclay former and is a low-temperature element for use in ovens and hot-cupboards. Manufacturers, however, are permitted to supply approved low-temperature elements of their own design in lieu of the second type mentioned, but such elements must conform to specified dimensions and fixing centres. For radiators, a luminous type of element is generally required.

Two sizes of electric hot-cupboards have been designed for use in all types of ships. They are constructed of aluminium alloy, and are provided with lagging 2 in. thick, and the elements are mounted on the inside wall of the cupboard, being merely protected from damage by a perforated shield; elements can be readily renewed, the dimensions representing the clear space inside the cupboard :—

Size 1.—20 in. wide, 16 in. deep, 27 in. high—1,000 watts.
Size 2.—32 in. wide, 20 in. deep, 27 in. high—2,000 watts.

Electric bread-baking ovens of full-sack capacity are being fitted in the latest ships. Tried against a steam-heated oven, the electric oven showed marked superiority in the time required to attain baking temperature, both from the cold

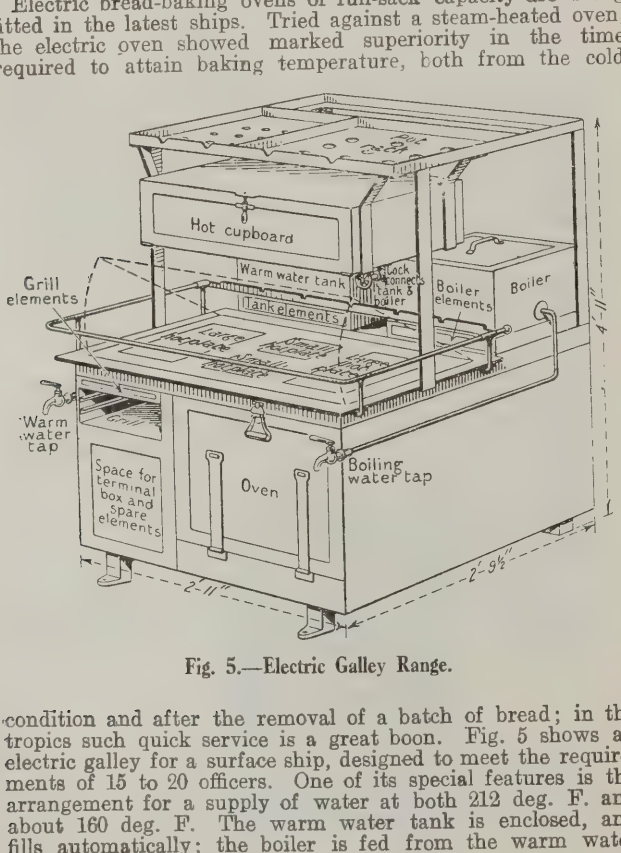

Fig. 5.—Electric Galley Range.

condition and after the removal of a batch of bread; in the tropics such quick service is a great boon. Fig. 5 shows an electric galley for a surface ship, designed to meet the requirements of 15 to 20 officers. One of its special features is the arrangement for a supply of water at both 212 deg. F. and about 160 deg. F. The warm water tank is enclosed, and fills automatically; the boiler is fed from the warm water tank.

Cables.—The total length of single conductor in a large warship is of the order of 300 miles, and the importance of obtaining cables which will satisfactorily withstand the severe conditions of naval service needs no emphasis. Single-conductor cables are used throughout for the electric light and power circuits, but multi-core cables are extensively used for the low-power installation and for the control of circuit breakers. A very wide range of patterns is covered by the standard sizes; rubber-insulated, lead-sheathed cables were adopted as the standard in the British Navy almost from the beginning of naval electrical work, and still form the bulk of those used in H.M. ships. Wire armouring is sometimes used over the lead where additional mechanical protection is required, *e.g.*, the multi-core cables for circuit-breaker control wiring. The important ring main and certain other cables which are paper-insulated and lead-sheathed are also steel-wire-armoured. In submarines tough-rubber-sheathed cables are largely employed on account of weight and flexibility in comparison with the stiffer lead-sheathed cables.

Considering rubber-insulated cables as a class, their most serious fault for warship work is the inability of the insulation satisfactorily to withstand the high temperature to which it may be subjected in service; it may reach 170 deg. F. on the lead with an environment of 150 deg. F., and with varying humidity of atmosphere the layer of pure rubber, which it has been the practice to use next to the conductor, becomes plastic, whilst the compound rubber in many instances becomes either plastic or hard and brittle, depending on the materials used and the conditions of manufacture. It is doubtful whether the pure rubber next to the conductor is of any real value for cables liable to be operated under the conditions mentioned, and it might be preferable to protect it by other means. It is specified that no dripping shall occur when a sample of the cable is suspended vertically for 24 hours at a temperature of 75 deg. F.; the viscosity of the impregnating compound is very important in warship work. With the ordinary commercial types of compound chamber for sealing the ends of cables feeding switches the impregnating compound tends to leak into the switch, especially if the box is situated below the level of the ring main. Instances are also on record owing to loss of impregnating compound, of short-circuit between cores occurring in multi-core, paper-insulated cables run vertically; the paper at the top of the run became dry and brittle and vibration caused it to flake away sufficiently to allow neighbouring cores to make contact. To overcome difficulties of this character it is necessary to design sealing arrangements capable of remaining oiltight under resin oil pressure of 50 lb. per sq. in. for 2 hours at a temperature of 200 deg. F. The introduction of paper-insulated cables for warship work, and the precautions taken in connection with them, have been fully justified by experience.

In addition to the fixed cables, a large amount of flexible cable is used in warships: it is rubber-insulated, but the mechanical protection depends on the service for which it is to be used and may be cotton braiding, cord braiding, phosphor-bronze braiding, tough-rubber sheathing, &c. For certain purposes, *e.g.*, gun-firing circuits, owing to run-out recoil of guns, &c., the conditions are particularly severe, and considerable trouble has been experienced by breakage of the conductors. Tough-rubber-sheathed cables have been used in which tinned steel wires have been incorporated in the conductors to secure additional strength and also in the sheathing itself for the same purpose, but more satisfactory results are being obtained with cables in which a canvas reinforcement is embedded in the tough-rubber sheathing.

Formerly the bulkheads were drilled and tapped for fixing purposes, and perforated plating was employed to a considerable extent in order to reduce to a minimum the drilling of bulkheads. With the development of satisfactory method of electrically welding studs to steel plates* the drilling objection does not apply, and cables are now secured direct to bulkheads unless obstructions, temperature of bulkhead, or other considerations render plating necessary.

Insulating Materials.—About 1904, an important departure was the introduction of the skeleton frame method of switch gear construction, the electrical gear being clamped to steel bars insulated by tight wrappings of micanite; it has been satisfactory in service, and has been standard practice in the British Navy for over 20 years. The main objection to micanite is the liability of the varnish binder to soften at comparatively low temperatures. The introduction of the phenol-formaldehyde varnishes, generally known as bakelite varnish, gave rise to the hope that this defect would be overcome, since this type of binder does not again soften after the initial baking process, but it is not yet easy to obtain consistent grades of bakelite to withstand the onerous conditions of naval service. Other insulating materials used in naval

* L. J. Steele and H. Martin: "The 'Cyc-Arc' Process of Automatic Electric Welding," *Journal I.E.E.*, 1922, vol. p. 136.

work, such as tapes, oils, varnishes, &c., are, in the main, the same as those used in ordinary commercial work.

Secondary Batteries.—The use of batteries in surface warships is comparatively limited. The electricity supply to the gunnery and torpedo control circuits, telephones, and certain navigational instrument circuits necessitates small batteries as a stand-by; they are also employed for auxiliary lighting in certain important spaces, such as gun houses, while they are also used for wireless purposes and for portable hand-lamps; for the last-named apparatus alkaline cells are being used to some extent. In submarines the whole of the power for underwater propulsion is provided by this means, and the onerous conditions of working make the provision of a reliable battery an extremely difficult problem. In a modern submarine the number of cells varies in different navies

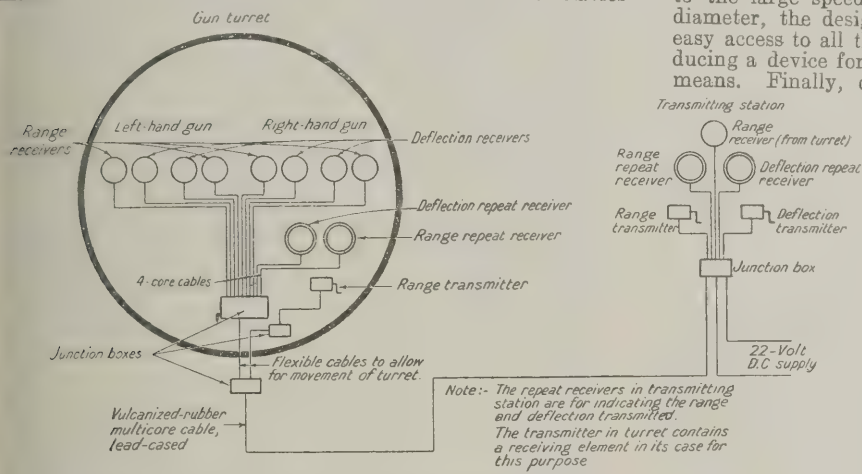

Fig. 6.—Range and Deflection Circuit.

according to the voltages used, the capacity of the cells ranging from about 2,000 to over 10,000 ampere-hours (5-hour rate).

The limited floor space available has necessitated the adoption of a cell of great length, compared with its lateral dimensions, totally enclosed except for a ventilation hole at the top. The plates are supported by the terminal lugs from the lids of the containers. All navies have experienced difficulty in obtaining satisfactory containers. Later types are of a special quality of ebonite, and in one case a bakelite product is being used successfully. Some difficulty has been experienced in so adjusting the composition that the containers will not deform when carrying the weight of the plates at temperatures up to 140 deg. F. and will not be brittle at lower temperatures. The necessity for packing the cells very tightly together imposes quite rigorous limits of accuracy in the manufacture of containers, the tolerance allowed being only 1/16th in. on any of the overall dimensions. Since 1911 pasted plates have been employed, and the rapid increase in the capacity/weight ratio which occurred about the year 1914 resulted in a battery with a very short life, from about 2 to 3½ years, although in especially good cases a life of 5 years has been obtained. The average condition of condemned pasted positive plates may be represented as follows:—

The lower third of the plate—all active material gone.
The middle third of the plate—50 per cent. of active material gone.
The upper third of the plate—25 per cent. of active material gone.

Although no satisfactory explanation is forthcoming, it may be connected with the very uneven current distribution consequent on the use of long, narrow plates; unless a cell is provided with some reliable mechanical means of preventing this shedding, it cannot be expected to give satisfactory service in a submarine. In proximity to the engines and in the tropics sulphation troubles sometimes arise, and there is increasing evidence that with the new types of cell, in which support is given to the positive paste, ultimate failure may be due to sulphation of the negative paste. It is customary in different navies to employ a lower acid density in the tropics than in temperate climates, the figure adopted generally corresponding to 1,210-1,220 at 60 deg. F.

It is desirable to regard ventilation as separate from the cooling, although they may be combined. In the later batteries used by several navies the closed cell is employed, the gases from each cell being led by small pipes into larger ones and thus exhausted. At the same time, air is drawn over the tops of the cells; very little cooling effect can be obtained through the container walls owing to their low heat conductivity, but the large mass of metal exposed at the top of the cell in the terminals and inter-cell connectors enables a considerable cooling effect to be obtained by this means.

Submarine Problems.—The submarine is an electrical ship, the electric motor having provided the best solution for underwater propulsion. To indicate the amount of electrical apparatus installed in a submarine, it may be stated that its weight is not less than 14 per cent. of the underwater displacement of the ship; the weight of the battery is about 7 per cent. A normal electrical output would be of the order of 1,400 s.h.p. developed on two propellers. When separate battery-charging generators are used, this output would be maintained at all speeds of the ship; that is to say, a propelling motor would be installed on each shaft to develop 700 b.h.p. at all speeds from, say, 250 to 400 r.p.m. at 300 volts. The motors are usually double-armature machines, with series-parallel battery grouping, which arrangement is well suited to the large speed-range necessary. Of an unusually small diameter, the design has also to incorporate some method of easy access to all the field poles and windings, either by introducing a device for turning the field frame on rollers, or other means. Finally, dissipation of the heat has already been satisfactorily accomplished by totally enclosing the motors and water-cooling the circulating air. The number of electrically-driven auxiliaries may be about 60, of capacities of 70 b.h.p. down to very small powers. Distribution is effected on the ring-main principle. Pressures of 120 to 230 volts, according to the type and nationality of the submarine, are used, and in consequence the currents to be dealt with are very high, and a number of large cables per pole may be required for portions of the ring-main system; power cables are usually tough-rubber-sheathed outside the pressure hull of the submarine, and special designs of glands and fittings have to be used to withstand high water pressures during submergence. Various warning alarms and the usual telegraph indicators and telephones are usually similar to those used in surface ships, and are operated from the 22-volt supply obtained from motor-generators.

Wireless Telegraphy and Telephony.—A large ship contains a number of wireless sets designed for different purposes; spark sets, arc sets, and valve sets, for both Morse and telephony, are used, the transmitting circuits ranging from about 15 kW to a fraction of 1 kW. The necessary power is usually obtained from the ship's d.c. supply through motor-alternators or rotary convertors, and step-up transformers. The high pressures and frequencies employed introduce special problems: examples are the special aerial trunks between decks, and the very thorough bonding and earthing (*via* the lightning conductor) of all isolated metal work on masts and yards, and the ends of wire stays and shrouds.

"Low-power" Apparatus.—A large amount of apparatus in a warship cannot conveniently be supplied direct from the lighting and power circuits. Some of this requires alternating current and some direct current; the pressure may be anything up to 100 volts, but by far the greater part is supplied at 22 volts d.c. by motor-generators *via* control

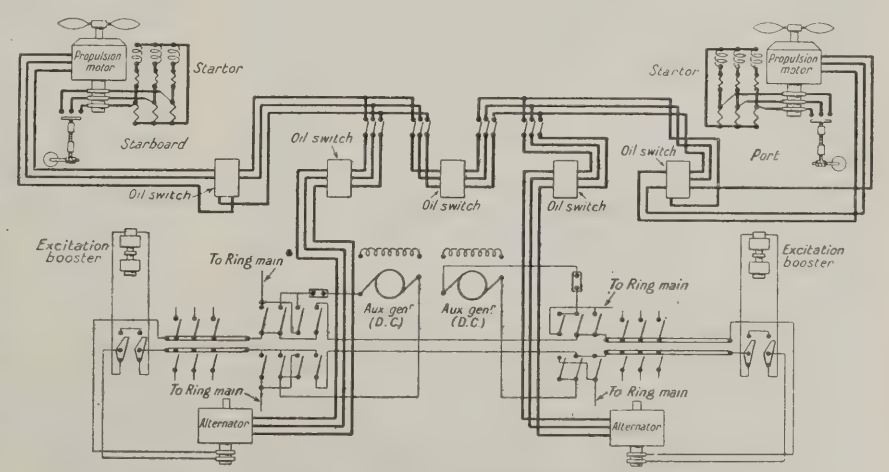

Fig. 7.—Auxiliary Diesel-electric Equipment, H.M.S. "Adventure."

apparatus and distributing panels feeding circuits grouped as follows:—

(1) Fire and torpedo control circuits; (2) telephone circuits; (3) miscellaneous low-power circuits such as bells and gongs, buzzers, rattlers, turbine and telegraph direction tell-tales, &c.; (4) gun and torpedo firing circuits.

In some cases any generator can feed any group normally run independently, and batteries, which normally float in parallel with their associated generators, can take over the load in the event of failure of the motor-generators. In the largest ships the capacity of these batteries may be some 500 ampere-hours at the 5-hour rate. Examples of low-power apparatus which is not supplied from the 22-volt installation referred to, but has its own motor-generator, are (1) hummers;

(2) bearing indicators for guns and searchlights; (3) turret danger signals; (4) gyro-compass and repeater circuits.

The control of guns, torpedoes and searchlight is complex, of great variety, and confidential.

The type of instrument most largely used is a simple step-by-step motor with unwound armature, in the stator of which a rotating field is produced by means of a commutator type of transmitter supplied with direct current. The rotor moves in steps of 15 deg., so that it has to be geared down considerably to obtain the accuracy required. The main installation consists of a multiplicity of such instruments and the necessary circuits of multi-core cables with their connection boxes, change-over switches, &c. For searchlights and certain other purposes where the accuracy required is not quite so high as for the guns, another method works on the Wheatstone bridge principle. In addition, numerous step-by-step indicators are employed for the passing of orders, ranges, and other information; a simple range and deflection circuit is shown in fig. 6.

For the electrical firing of guns by current growth to the value required to heat a fusible bridge and the surrounding pad of inflammable material to the ignition point, the circuits are usually made single-pole with an "earth" return. A most elaborate system of auxiliary apparatus, mostly electrically operated, into which the gyroscope enters to a large extent, is usually provided to assist the gunnery officers to make good practice.

Telephone communication is provided between all important stations and, in addition, between offices, cabins and other compartments. In a large modern warship there may be up to 700 telephones, of which some 370 are on the various exchanges with "trunk line" connections. All telephones are supplied from the low-power board; two wires per instrument are now generally used, and to prevent communication noises and cross-talking, inductive "line coils" are included in the supply to each pair of telephones, which also serve as relay coils; non-inductive shunts, or condensers, provide a path for the oscillating currents. Special loud-speaking telephones are used in particularly noisy compartments, or for "broadcasting" purposes.

Electric Propulsion.—The chief considerations are flexibility, weight, space and economy. The geared turbine drive certainly lacks flexibility. The economy of an electric drive can be made to approximate to that of a geared drive. At full power the efficiency of turbo-electric transmission is usually somewhat lower than that of a geared turbine drive. At lower powers, such as are required for cruising, the efficiency of the electric drive is usually higher than that of the geared turbine. The ability to drive all propellers at low speed from one generating unit only, appears to be an advantage from the military standpoint as well as from that of economy. The fullest use of science and skill must continue to be made by electrical engineers, in conjunction with marine engineers, if the well-established and efficient mechanical transmission is to be more than equalled with regard to (*a*) full speed of the ship, (*b*) weight, (*c*) space occupied, and (*d*) cost.

In *H.M.S. Adventure*, an auxiliary ship of approximately 8,000 tons displacement, Diesel-electric propelling machinery for cruising speeds has been installed, fig. 7. The power developed on each shaft is approximately 2,100 s.h.p. at a propeller speed of 160 r.p.m. A three-phase a.c. system is adopted, the pressure being 1,100 volts between phases. Two three-phase high-speed induction propelling motors are used, one for the port and one for the starboard side of the ship; each is normally supplied from its own alternator, which is directly coupled to a Diesel engine. The two 343-r.p.m., 1,650-kW alternators do not run in parallel; under emergency conditions, however, it is possible to run both motors from one alternator, or the port motor from the starboard alternator, or *vice versa* The motors have wound rotors and are brought up to speed by the use of reactance-resistance starters. Special provision is made for over-excitation of the alternators by the use of a novel type of automatic booster to meet the conditions of temporary or periodic overload due to heavy weather or similar causes.

The control of the motors and alternators is carried out by oil-break switches, with operating mechanism on the control platform in the Diesel-engine room. The control and operation of the plant has been so arranged that the whole sequence of operations is carried out by means of a single hand-wheel for each side of the ship, the usual protective devices being fitted. The paralleling of the alternators is prevented by mechanical interlocks. The installation is as simple as can be arranged; instruments of various types have been provided to supply all possible information for the study of the performance under varying conditions.

Miscellaneous Electrical Appliances.—There remain a number of miscellaneous applications which, although not large in themselves, are none the less important. Included in this category are gyro-compasses, hummers, rattlers, buzzers, turbine and telegraph direction tell-tale, Forbes log, turret danger signals, Röntgen-ray apparatus, electrically-driven domestic machinery, such as kneading machines, mincers, and laundry machines, electric torches and portable accumulator hand-lamps, electrically-driven printing machines, &c. The accumulator hand-lamps resemble miners' lamps, and are used for magazines and danger spaces; the alkaline cell is finding increasing favour for portable apparatus of this character.

Finally, as a last example of the extent to which a large variety of modern electrical apparatus has been adapted to naval needs, electric starting and lighting sets at 12 volts, on the general lines of motor-car equipment, find their application afloat in the motor boats of the fleet.

Conclusion.—Electricity is not only an invaluable adjunct, but has become an integral part of a fighting fleet's structure. It is recognised that the greatest progress is made by a proper understanding of when and how co-operation with research and other workers should be effected, and by a vigorous development of experimental work; but, in the selection of the most suitable equipment for warship work, caution is necessary, for any defect arising at a critical period in action in machines or apparatus fitted in large numbers in vital parts of a warship's installation may cause consequential damage to the community which may have very far-reaching effects.

The author emphasises the difficulties imposed by limitation of space and weight, sea conditions, extremes of heat and cold, the claims of other services in the ship, and the difficulty of fitting in one requirement with another. So far as the British Navy is concerned, all these conditions are reflected in the detailed requirements of the Admiralty specifications. It is desired to place on record the willingness with which manufacturers in this country have co-operated in matters of investigation and development when invited to do so, and it is encouraging to know that much of the effort to meet naval conditions is not without its benefit to the electrical industry and is often reflected in commercial practice.

[The paper, which was illustrated with lantern slides depicting apparatus which has been devised for testing lamps and electrical gear for use in ships, and indicative of the damage ships are liable to sustain in action, includes instructive data in tabular form, together with a digest of the arguments for and against electric propulsion, which are, however, too lengthy for reproduction.—Eds. Elec. Rev.]

Electrical Development in Spain.

A Review of the Progress Made During 1926.

In a recent issue of *La Energia Electrica*, of Madrid, Señor F. Gallego gives an interesting summary of the electrical progress in Spain during 1926. The most notable feature of the year was the decision of the Spanish Government to assist financially in the development of hydro-electric stations, which had previously had to be borne entirely by private enterprise. One of the first schemes to be assisted on a "fifty-fifty" basis is that of the Sociedad Canalizacion y Fuerzas del Guadalquiver, which is not only rendering the section of the river between Cordoba and Seville navigable, but will also provide electric power to the extent of about 62,000 h.p. The Government is also assisting, among others, a scheme of the Sociedad Hispano-Portuguesa de Transportes Electricos to utilise the power of the river Douro.

Among the new hydro-electric stations which were completed during the year is that known as La Vid, belonging to the Sociedad Hidroelectrica Legionese. The plant utilises the water power of the river Porma, and although only 700 h.p. is so far available, this is to be extended to 1,400 h.p. in the near future. At La Jorquera, in the province of Albacete, the plant which utilises the power of the Dornajos falls was extended from 2,000 to 4,000 h.p. At Olloniego (Asturias) the Sociedad Electra de Olloniego completed a 1,000-h.p. station on the river Nalon, the power generated being transmitted to Mieres and Tudela-Veguin. The Sociedad Hidroelectrica de Navarra completed a 1,500-h.p. plant on the river Garganta de Tormes, in Avila Province, while at Bidasoa (Navarra Province) the Sociedad Hidroelectrica de Lombilla put a 3,200-h.p. plant into operation. A small 300-h.p. hydro-electric station was also completed by the municipal authorities of Deva (Guipuzcoa).

Many of the old-established electricity supply undertakings also carried out further extensions. The Sociedad General Gallega de Electricidad extended its 70,000-V transmission lines to Santiago, Villagarcia, Pontevedra and Vigo. The Sociedad Sevilla de Electricidad is making good progress with the establishment of its new 4,000-h.p. hydro-electric station at Cala, 20 miles from Seville, and it is expected that the plant will shortly be put in operation. The Sociedad Hidroelectrica de Castilla is engaged on the construction of a dam to collect the water of the Villalba de la Sierra falls, which will render 15,000 h.p. available. The Sociedad Salto del Cortigo is establishing a hydro-electric station on the river Ebronea, near Fuenmayor (Province of Logrono). The Sociedad Hidroelectrica Espanola is increasing the plant at its station at Villora (Cuenca Province) up to a capacity of 47,400 h.p.; the transmission line between the station and Madrid is being altered to transmit power at 130,000 V instead of at 25,000 V. The Sociedad Energia y Industrias Aragonesas, whose station at Biescas, on the river Gallego, has a capacity of 10,000 h.p., has established a 60,000-V transmission line to supply a number of industrial works in the Sabinago district. During the year the Sociedad Hidroelectrica del Cantabrico installed two further 3,300-kVA turbines and generators at its station at

Sorniedo, bringing the capacity up to 14,000 kVA; three 5,000/50,000-V transformers, one of which is held in reserve, were also installed. The company has also erected a 50,000-V transmission line between the power station and the State gun factory at Trubia. A transmission line is also being erected between the sub-station at Naranco (Oviedo) and the distribution system of the Sociedad Co-operativa Electrica de Langreo, with the view of an interchange of power between the two concerns, whenever it becomes necessary.

La Sociedad Union Electrica de Cataluna completed a 40,000-V transmission line between the hydro-electric stations at Tremps and Pobla de Segur in Catalonia. The Sociedad Fuerzas Motrices del Ville de Lecrin completed a number of 6,000/220-V transformer stations for the supply of power to seven small towns. A 25,000-V line, about 20 miles in length, has also been completed between the sub-station at Santafe de Mondujar (Almeria) and the mines of the Sociedad Minera en Lucainena de la Torres, where a 25,000/2,100-V transformer plant has been installed. La Sociedad Electrica Industrias Coruuesa has added a new 1,200-kVA transformer to its power station at Capela, and one of 500 kVA at the sub-station at La Coruna. A second transmission line has also been erected on the existing masts. The Co-operativa de Fluido Electrico of Barcelona is establishing a steam-operated station at Adrall, and also proposes to erect a plant to utilise the water power of the Cadi falls. Work has also been commenced by the Sociedad Electrometalurgica Iberica on a 30,000-h.p. plant to utilise the power of three falls at El Burguillo.

As regards electric traction a new 3¾-mile section of the underground railway in Barcelona was completed, as also were a local electric railway 12½ miles in length between Vigo, Romallosa and Bayona; a new branch line between Palma de Mallorca and Establishment, and a cable railway between La Reineta and San Salvador del Valle, 1,312 yards long, with a rise of nearly 400 ft. The electric traction work in progress comprises further extensions of the Barcelona underground railway, the Vitoria-Estella railway, and the electrification of the Spanish section of the Trans-Pyrenéen railway from Ripoll to Aix-les-Therms and from Bilbao to Las Arenas and Plencia. The Northern of Spain Railway Co. is also electrifying the line between Barcelona and Manresa.

Señor Gallego concludes with a table showing that there are now one hundred hydro-electric stations in operation in Spain with a capacity of over 1,000 h.p. each, the total power at present utilised in the country being 758,150 h.p., while in a second table he gives brief particulars of further hydro-electric projects totalling 3,199,900 h.p. for which concessions have already been granted or in respect of which plans are in course of preparation.

Indian Electrical Notes.

(From Our Indian Correspondent.)

Electrical Trade in 1926.

THE year 1926 has again recorded a notable increase in the imports of electrical machinery and apparatus into India. The imports of electrical machinery increased in value from 209 lakhs in 1925 to 248 lakhs. Generators and dynamos increased from 34 to 52 lakhs, transformers from 13 to 28 lakhs, and turbo-generator sets from 15 to 20 lakhs; but control and switchgear declined from 38 to 36 lakhs, and motors from 36 to 31 lakhs. The United Kingdom's share of the trade rose from 174 lakhs to 203 lakhs. The United States and Germany have also recorded increases, the former from 17 to 20 lakhs, and the latter from 9 to 10 lakhs. The trade in electrical apparatus amounted in value to 240 lakhs, as against 227 lakhs in the previous year. This trade has shown steady increase during the last three years. The share of the United Kingdom, however, remains the same as in 1925, *i.e.*, Rs.158 lakhs, but compared with 1924 shows an increase of 20 lakhs. All other countries were able to increase their shares, notably the United States, imports from which rose from 20 lakhs to 33 lakhs. Germany also increased her share by about 1 lakh to 23 lakhs. It appears that the increase in the trade is taken up almost entirely by the United States. The imports of electric wires and cables amounted to Rs.80 lakhs, almost the same as in the previous year, but the United Kingdom's share declined from 73 to 69 lakhs. Electric fans increased from 28 to 31 lakhs, electric lamps from 21 to 30 lakhs, and accumulators from 12 to 14 lakhs. The imports of radio apparatus amounted to 5 lakhs in value, almost the same as in the previous year. About 4½ lakhs' worth came from the United Kingdom.

Radio Apparatus Import Regulations.

The following instructions regarding the importation into India by private persons, of apparatus for radio-telegraphy have been issued by the Government of Bengal:—

1. Radio apparatus may not be imported into British India without an import licence, which is issued by the Director-General of Posts and Telegraphs. 2. Persons, who are not dealers in radio apparatus, may, however, be allowed to import on temporary permit apparatus not exceeding one complete receiver (or its component parts) and necessary spares. This temporary permit may be obtained from the competent Customs officer on presentation of an application in the prescribed form to which postage stamps to the value of 10 rupees have been affixed. 3. This fee of Rs.10 is the annual fee for an import licence, and is additional to any Customs duty which may be leviable on the imported apparatus. 4. The import licence will be forwarded subsequently to the applicant by the Director-General of Posts and Telegraphs, and will be valid until December 31st of the year of issue, unless dated on or after November 1st in any year, when it will remain valid for the whole of the following year. Item 4 in the application form should therefore include all apparatus that the applicant intends to import during the validity of the licence and not merely the apparatus in respect of which the temporary permit is required. 5. Transmitting apparatus may not be imported on a temporary permit, and Customs officers are not authorised to accept application forms except on the conditions contained in para. 2 above. In all other cases the application form, after completion, should be forwarded by the applicant to the Director-General of Posts and Telegraphs (Wireless Branch), Simla, to whom all other inquiries regarding importation of radio apparatus should be addressed.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Wessex Electricity Bill.

This Bill, the purpose of which is to incorporate and confer powers upon the Wessex Electricity Co., was before the Unopposed Committee of the House of Lords on April 5th, and was ordered to await report. The Bill authorises the company to raise capital to the extent of £750,000, and to borrow to the extent of half the amount of capital issued. The basic dividend is to be 8 per cent. per annum, and power is given to increase the dividend paid in accordance with decreases in the price charged for electricity. The first directors will be Sir Philip Dawson and Messrs. G. I. Phillips, F. M. Rogers, G. C. H. Hamilton, H. W. Couzens, J. H. Edwards, F. N. Curzon, and H. C. Hambro. The company's area of supply will include parts of the counties of Oxford, Bucks, Berks, Southampton, Wilts, and Gloucester.

Yorkshire Electric Power Bill.

The Unopposed Committee of the House of Lords, on April 5th, ordered this Bill to be reported for third reading. The main purpose of the Bill is to enable the company to raise additional capital of £2,000,000 (nominal), and power is also given to borrow up to one-half the nominal amount of the additional capital which at the time of borrowing has been raised and of which not less than one-half has been paid up. The borrowing powers in respect of the existing capital are also increased from one-third to one-half the amount. (The capital authorised by the company's existing Acts is £4,000,000.)

Pacific Cable Bill.

On March 30th, Mr. Amery, Secretary of State for the Dominions, moved the second reading of the Pacific Cable Bill, which consolidates, with amendments, the Pacific Cable Acts, 1901-1924. He explained that the Bill embodied agreements arrived at during the Imperial Conference by the Governments concerned in the administration of the Pacific cables on certain matters affecting both the constitution and organisation of the Pacific Cable Board and the financing of the undertaking. The two main points on which the present measure changed previous legislation affected the constitution of the Pacific Cable Board and the building up of the reserve fund. The Board was an organisation on which the Governments of Great Britain, Canada, Australia, and New Zealand were represented. On the Board the interests of Great Britain were represented by three members out of seven, and also by the right of the Treasury to appoint the chairman. This preponderance of British control in a joint venture was due partly to the fact that the original capital of £2,000,000 required for the construction of the first cable was advanced on loan by the Treasury, and it also reflected the conception of 25 years ago with regard to the natural position of dominance which the Government should occupy. When the first cable was completed in 1902, it was provided that £77,000 a year should be devoted to payment of interest and sinking fund on the original advance of £2,000,000 made by the Treasury. During the early years between 1902 and 1914, there was a regular loss, which amounted to £713,000, but in 1914 and 1915 the situation changed, and since then the Pacific cable system had shown a regular and substantial profit. In 1911 the Board thought it was desirable to supplement the original cable by an additional cable between Australia and New Zealand, and an Act of Parliament was passed enabling the reserve fund to be used for that purpose. It became evident

that a further cable would be required, linking Fiji with New Zealand, and also with Australia, and that the system would have to be duplicated owing to the increased volume of traffic. In 1922 it was decided to lay a cable of the newest type, and it was completed, linking Australia and New Zealand with this country, *via* Canada. After the present year, the sum of £10,000, or one-tenth of the year's surplus, whichever was the larger, was to be placed in the reserve, subject to the provision that the reserve might be further increased or diminished by consent of the partner Governments. In the next two years, after the present year, after that contribution was paid over to reserve, the surplus, if any, would be distributed among the partner Governments. After the next two years the surplus would be equally divided between repayment of the original capital and distribution among the partner Governments. They were now in a position to accelerate the repayment of the original £2,000,000, a sum that was now reduced to a total of £1,270,000. By so doing they would set free a larger surplus, either for a further reduction of rates or for a distribution of profits among the Governments concerned. The service was an invaluable asset to the commercial development and the security of the British Empire. The Bill was read a second time.

London Joint Electricity Authority Bill.

The Standing Orders Committee of the House of Lords, on April 7th, considered an application that Standing Orders be dispensed with in the case of the London and Home Counties Joint Electricity Authority (No. 2) Bill. The Examiner had reported that the Standing Orders had not been complied with, inasmuch as the notices were not published and the deposits were not made until March, 1927, instead of the dates prescribed. The application was opposed by the Barnes Urban District Council.

Mr. Harry G. Pritchard said that one of the main difficulties with which the Authority had to contend was that its area was divided into no fewer than 86 different electricity areas, each with its separate electricity undertaking; the supply of electricity in the area was derived from 60 generating stations, many of which were old and very uneconomical to run. It being recognised that the proper method of providing a supply was to have well-situated, well-equipped generating stations, where generation could be carried on in large units in a wholesale manner, the Authority had decided to erect a station, as, indeed, it was bound to do. It was advised that the station should be in the western part of the area, as that was the centre of the greatest demand at present; that it must be situated on the Thames, in order that there should be an adequate supply of water; and that it must adjoin a railway. The Authority considered that the site which it had selected was the only really suitable one. It was about 45 acres in extent, and was situated at Duke's Meadows, Chiswick. The Chiswick Urban District Council had agreed to sell the land, but had imposed certain conditions. One condition was that, inasmuch as the land was intended to be used as playing fields, the Joint Authority must provide another open space in substitution for it. The Joint Authority had made a provisional agreement with the Duke of Devonshire, who owned that land, for its purchase, if Parliament agreed to the proposal in the present Bill. Another condition was that the Joint Authority should provide a promenade walk between the station and the river. There was a town-planning scheme for the area, and the proposed site could not be used unless that scheme were amended. The Joint Authority had anticipated that these arrangements could be carried through under the general law and without further statutory authority, and it had applied to the Electricity Commissioners for approval of the erection of the station. The Chiswick U.D.C. applied to the Ministry of Health for its approval, but after inquiry the Minister decided that he could not give his consent to the modification of the town-planning scheme, and, in effect, he had invited the Authority to put the matter before Parliament. The Authority had been pressed for time, and steps had to be taken somewhat hastily. When its first Bill came before the Examiner a memorial was presented by the Barnes U.D.C., and the Examiner held that the Standing Orders had not been complied with in some respects. After consideration, it appeared that the best course would be to discontinue the promotion of the Bill and to commence the proceedings *de novo* by the promotion of a late Bill, in regard to which the Standing Orders would be complied with in their entirety, except, of course, with regard to the dates of deposits and notices. The Examiner was satisfied with the present Bill, and he (Mr. Pritchard) asked the Committee to allow the Bill to proceed. The only opponent was the Barnes U.D.C., which was not the local authority for the area in which the site was situated. Finally, he pointed out that if the present Bill were not allowed to proceed, another Bill would be promoted next session for the same purpose. That would lead to additional expense.

Mr. H. E. Swallow, on behalf of the Barnes Council, said that the fact that the Barnes U.D.C. was the only opponent to the proposal to dispense with Standing Orders was no indication whatever of the magnitude of the opposition to the Bill itself which would be forthcoming in Committee if the Standing Orders were dispensed with. The land on which it was proposed to erect the generating station had been the subject of inquiry previously. In 1914 the Brentford Gas Co. had sought powers to acquire compulsorily part of the land for the erection of gasworks, but the proposal was rejected by Parliament. In 1918 the Brentford Gas Co. proposed to use a site in the same neighbourhood for the erection of gasworks, but the proposal was opposed by various interests, and was withdrawn. Again, in October last, the Ministry of Health had decided not to amend the town-planning scheme. That scheme was designed just as much in the interests of Barnes as of Chiswick. The Minister of Health did not consider that the land should be allowed to be used unless no other suitable site could be found for the purpose without involving a material increase in the cost of the proposed electricity service, and it did not appear to him that that had been demonstrated. If Standing Orders were dispensed with, there would not be sufficient time remaining in the present session to enable Parliament to consider the substantial opposition that there would be to the proposals in the Bill. If promoters of private Bills, which did not comply with Standing Orders, were to be entitled, even on the ground of urgency, to promote a late Bill, it might lead to serious laxity in giving proper notice to persons interested, and would greatly reduce the protective value of the Standing Orders.

Mr. Pritchard said that there were many Bills which had not yet been passed by Committees of the House of Commons, and would have to come before Committees of the House of Lords, and he considered it highly probable that the present Bill would catch them up. So far as he knew, there were no precedents for the procedure now suggested in *recent* times, but there were, in fact, precedents. The promoters of previous schemes had not undertaken to provide an alternative site for public pleasure grounds, and had not received the approval of the local authority, as the Joint Authority had done in this case.

The Committee agreed to recommend that Standing Orders be dispensed with.

Private Bill.

The Hastings Tramways Company (Trolley Vehicles) Bill has been read the third time in the House of Commons.

Electrical Artificers.

On April 1st, Mr. Hore-Belisha asked the First Lord of the Admiralty what was the strength of the electrical artificer branch.

Lt.-Col. Headlam, Financial Secretary to the Admiralty, said that the numbers borne on March 15th were:—Electrical lieutenants, 4; commissioned electricians, 26; warrant electricians, 31; chief electrical artificers, 197; electrical artificers, 760; apprentices, 138; total, 1,156.

Answering a further question, Lt.-Col. Headlam said that an examination for the rank of warrant electrician was held on March 31st and April 1st, and it was the intention that normally an examination should be held annually in future. The last previous examination was held in March, 1922.

Electricity Charges at Pontefract.

On April 5th, Brigadier-General Brooke asked the Minister of Transport whether he was aware that the Yorkshire (West Riding) Electric Tramways Company, which supplied electric light and power in the Pontefract area, was still charging the increase of 15 per cent. which was imposed in November last; and whether, seeing that the price of coal had been in process of reduction since that period, and in view of the lower comparative charges in towns neighbouring on Pontefract, he would refer the matter for inquiry to the Electricity Commissioners.

Colonel Ashley said that the question of electricity charges in Pontefract had already been the subject of correspondence between the Electricity Commissioners and the company, which had intimated that the 15 per cent. increase would be withdrawn on April 30th. The Commissioners were still in communication with the company on the question of comparative charges in the neighbouring towns.

Coal-Handling Plant in India.

Among the equipment of the new Garden Reach plant of the Calcutta Electric Supply Corporation, Ltd., is a complete electrically-operated coal-handling plant supplied by Messrs. W. J. Jenkins & Co., Ltd., Retford. According to *Commerce* (Calcutta), the coal upon arrival is discharged into a specially-constructed pit with a capacity of about 100 tons. At regular intervals an electric 2-ton grab transfers the coal by way of a telpher to receiving hoppers, which feed a breaker. Upon being broken to suitable size, the coal passes through a rotary filler into the buckets of an endless conveyor. Reaching a specially-constructed tower, the coal is elevated to a height of 40 ft., and then continues horizontally until it reaches the bunker hoppers, being automatically weighed in the process. Here the buckets are mechanically tipped. Immediately beneath each bunker hopper is a raised platform complete with track on which run two weighing and delivering machines electrically driven. These machines receive the coal from the bunkers and deliver it to the respective furnaces as required. The whole plant is capable of dealing with 50 tons per hour. The ash is removed by a similar labour-saving arrangement.

Correspondence.

Correspondents should forward their communications **as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

Testing Three-wire A.C. Networks.

A correspondence on the testing of three-wire a.c. networks would be very useful. One can test d.c. networks by Raphael's method, which reveals neutral faults very efficiently, but this does not appear to apply to alternating-current systems. The usual method is to put first one side of the system directly to earth and then the other side. This can only be done by breaking the neutral connection to earth, an undesirable thing to do, as the neutral ought properly to be bonded very strongly to earth so that if the high-pressure windings should happen to come into contact with the low-pressure windings in the transformer, the circuit breaker would be opened at once. Perfect safety is best assured when there is no switch between the neutral and the earth connection.

The method of putting the outers to earth at frequent intervals has other objections. It is crude and unscientific, and will tend to breed faults by putting an undue stress on the installations connected. Yet if there are no other methods available one must just do it.

April 6th, 1927. **Faults.**

Municipalities and Foreign Tenders.

The decision of the Manchester Corporation to place a contract with a foreign firm, and the report of the proceedings leading to this decision, make interesting reading, and confirm the opinions expressed by the writer in your "Correspondence" columns some time ago.

It is about time that our municipalities woke up to the fact that price-fixing associations are taking undue advantage of the specious plea that placing orders at home provides more employment. The fact is that groups of manufacturers artificially fix prices which bear no relation whatever to the cost of production, and the ratepayer is "fleeced" in order to swell profits and subsidise shareholders.

Further, to encourage the formation of price-fixing groups is to put a premium on inefficiency, at a time when every means should be adopted to reduce costs of production if we are to compete in the world's markets.

Those who talk glibly of the glories of free and open competition seem to be the very people who wish to eliminate competition by the formation of rings and combines.

It is to be hoped that Manchester, true to its traditions, will have set a good example to other municipalities in the struggle for economy.

April 9th, 1927. **Salesman.**

River Water—or Cooling Towers?

We have read with interest the article published on January 7th, 1927, in your paper on "River Water or Cooling Towers?" by Mr. J. N. Waite, M.I.E.E.

We should like to communicate with the author, as we have had considerable experience in cooling towers and have also some data on the cost of operating with river water as compared with cooling towers.

We might state that here, in New York, one of the large ice manufacturing companies has plants in different sections of the city, and in one case it operates its ammonia condensers with river water and in the other case with cooling-tower water; in both cases the power is obtained from the electric service company. The cost of energy figured on the basis of kWh per ton of ice produced shows a considerable reduction in favour of the cooling tower. We have monthly records in both plants, which make a very interesting comparison.

Referring to Mr. Waite's article, we note that he bases his calculation on the temperature of water from cooling towers being 75 degrees with 45-degree wet bulb, or 30 degrees difference between the wet bulb and the water. In a modern efficient cooling tower the difference should not be over 10 degrees.

He also does not state that the temperature of river water may be higher in the winter time than cooling-tower water, and lower in temperature in the summer. In many cities the current requirements are greater in the winter than in summer. We believe a closer study on the part of Mr. Waite, covering average yearly conditions, might show a cooling water more efficient than river water; this may not be true in every case, but is probably very certain in many cases, especially in the South. The most important consideration is to have the cooling tower properly designed and of *ample* size to cool to within 5 to 10 degrees of the wet bulb under the worst atmospheric conditions.

Edwin Burhorn Co.

New York, U.S.A., *March 31st*, 1927. E. Burhorn, *Pres.*

The Salaries of Engineers.

Following with interest the correspondence which has been published by you during the past few weeks, relative to the low salaries in the engineering profession, one of the most pertinent phrases—to my mind—in any of the letters was in that written by "P.W.," in which he stated "that he was referring to engineers' salaries outside the E.P.E.A." He has, in that phrase, pointed with no uncertain finger to the remedy for low salaries—*i.e.*, organisation.

The definition of an Association is "A body of men banded together to do something." This the E.P.E.A. has taken to heart, and it has worked unceasingly towards raising the status of engineers, first, by claiming on their behalf an adequate salary for services rendered and successfully negotiating the present National Joint Board Schedule for the electricity supply industry.

The E.P.E.A. has a strong nucleus of members who are *not* electricity supply engineers, of which I am one, and it has been successful in raising their salaries and improving their conditions of employment.

Until engineers realise that it is only by becoming active members of an association that they can work out a solution to their own problems, "Poor Blighter" and others will be able to pen such a series of letters as those which have appeared under the above heading.

If these gentlemen would spend their time and energy in an association, bearing in mind the definition previously quoted (and "P.W." has pointed to the appropriate organisation, *i.e.*, the Electrical Power Engineers' Association), then the writer is convinced that they would—in time—be able to subscribe themselves similar to himself—

April 8th, 1927. **Satisfied E.P.E.A.ite.**

Legal.

Lord & Shand v. Webb.

At the Plymouth County Court, on April 6th, Messrs. Lord and Shand, electrical contractors, sued Mr. W. H. Webb, builder, for moneys due for alterations and repairs to electrical installations in two of the defendant's houses. For the plaintiffs it was stated that the installations were put in by them, the original quotation being £16. The defendant later ordered two-way switching for which an extra charge of 7s. 6d. per house was made. A payment of £16 only had been made. Subsequently, complaints were made that the installations were faulty, and it was discovered that at one house a nail had been driven through the cable; the damage was repaired at a cost of £1 12s. 6d. At the other house the faults were found to be due to the dampness of the walls and for work in connection with that installation a charge of £2 8s. 6d. was made. The plaintiffs were now claiming the three amounts mentioned which the defendant refused to pay.

The latter stated that he understood that two-way switching was included in the original quotation. He had given no instructions for the remedying of defects in the wiring and said that he had never had complaints of dampness in houses which he had built.

His Honour Judge Gurdon accepted the plaintiffs' evidence as to the repairs and awarded them £4 1s.; the claim for two-way switching was dismissed.

Wareham Electric Supply Co., Ltd.

Mr. Justice Romer, in the Companies Winding-Up Court on April 5th, again had before him the petition of Mr. W. E. Weston, of Hounslow, for an order for the compulsory liquidation of the Wareham Electric Supply Co., Ltd. It had been arranged that witnesses should attend for cross-examination if necessary, and that the whole of the facts concerning the company should be investigated. Mr. Wilfred Hunt, for the company, asked, however, for a further adjournment on the ground that his leader, Mr. C. A. Bennett, K.C., was unable to be present owing to illness, and also that the principal witness, whom it was desired to cross-examine—Mr. Eaton—was also too ill to attend that day, and would not be able to do so next week.

Mr. R. J. Willis, for the petitioner, said he was very anxious to have the whole matter thoroughly gone into, but he did not want to do it in bits, and he could not object to an adjournment on the ground of illness.

Mr. Galbraith, K.C., said he appeared for Mr. Edwards, a former voluntary liquidator of the company, who was present for the purpose of giving evidence if necessary. He agreed that it was a matter that must be disposed of once and for all.

Mr. Willis said that he would want to cross-examine Mr. Eaton.

Mr. Hunt suggested that the petition should stand over until the first company winding-up day next sittings. He said he would let the other side know in good time whether Mr. Eaton would be able to be present then.

His Lordship agreed to that course.

General Electric Co., Ltd., v. Currus Motor Accessories, Ltd.

A motion for judgment in default of defence in this action came before Mr. Justice Tomlin in the Chancery Division on April 5th.

Mr. Tookey, for the plaintiffs, said that the defendants had put in no defence. The action was for an injunction to

restrain passing-off in connection with the plaintiffs' trade mark "Osram" as applied to incandescent electric lamps and electric arc lamps.

His Lordship granted an order.

British Thomson-Houston Co., Ltd., v. Fox.

Mr. Justice Tomlin, in the Chancery Division on April 5th, had before him a motion by the British Thomson-Houston Co., Ltd., for an injunction restraining S. Fox, Bethnal Green Road, E., from infringing its patent for electric gasfilled lamps by selling lamps not of the company's manufacture.

Mr. Tookey, for the company, said that last Friday his Lordship granted an *ex parte* injunction. The defendant did not appear.

His Lordship granted the order.

Birkenhead Electrician Fined.

Summoned by the Birkenhead Corporation for preventing an electricity meter from registering the quantity of electricity supplied, Leonard H. Jackson, electrician, Birkenhead, was fined 40s., or 21 days, at Birkenhead recently. Evidence was given to the effect that when an inspector visited defendant's house he switched on the electric light, but found that whilst the power meter was "on" the light meter was "off." Defendant was running lights from the power meter and was only paying the power price.

Defendant said that a rod had dropped on the lighting wires, which became broken. He gave instructions for their repair, but the man who did the work evidently mistook the meters.

Reviews.

High Vacua. By G. W. C. Kaye, M.A., D.Sc., F.Inst.P., Superintendent of the Physics Department of the National Physical Laboratory. Pp. xii+175; figs. 91. London: Longmans, Green & Co., Ltd. 1927. Price 10s. 6d. net.

This volume is based on the Cantor Lectures which were delivered by the author during 1926. He has given an account both of the theory and of the appliances that are used in connection with high-vacua practice, which has not previously been done in so systematic a manner. The author's special training leads now and then to the introduction of valuable observations from his long experience.

If the history of scientific discovery is to a great extent the history of instruments, important discoveries have certainly followed every advance in vacuum technique. Those advances have been momentous during the last 20 years, chiefly owing to the researches of Gaede, Langmuir, and Dushman, of Knudsen in Denmark, and of Dewar and Campbell in England. The two fundamental principles of the physicist to-day are the structure of matter and the nature of radiation. The discovery of Röntgen rays, Coolidge tubes, hafnium, electrons, protons, isotopes, X-ray and positive-ray analysis, the cathode-ray oscillograph, thermionic valves, radio-communication, photoelectric cells, Dewar flasks, and even ordinary glow lamps would have been impossible without the improvement of vacua. It is difficult to state what the highest attainable vacuum may be, as all our measuring devices ultimately cease to operate, but it is assumed at the present time that the highest measured vacuum is of the order of 10^{-8} mm.

The main contents of the book consist of an introduction comprising a full survey illustrating the widespread utility of high vacua in the scientific and everyday world; an historical account of the development of vacuum pumps, vacuum tubes, and high-vacuum technique in general; a number of chapters dealing with backing and high-speed pumps and absorption methods of exhaustion; and, finally, two chapters dealing with high-vacuum gauges and the measurement of high-speed pumps.

The author exemplifies the large scale industrial applications of high-vacua pumps by referring to Sir Charles Parsons's pump and to the mercury-vapour pump used by Brown-Boveri for maintaining their high-power mercury-arc rectifiers at 0.01 mm. pressure; the rectifiers range up to 2,000 kW at 1,800 volts. The pump is of the bottle type, and is backed by a rotary oil pump; the whole system is insulated for high voltage, and is automatically controlled by a manometer and relays which start the heating and water-cooling and the backing pump. The "cleaning-up" of residual gases is effected by "getters," which are vaporised *in situ*. The evaporation probably produces intense ionisation and chemical activation, and the condensed film, afterwards deposited on the walls, holds the gas by absorption or trapping. In the case of electric lamps, the "getter" is an alcoholic soluti of red phosphorus and a salt (sodium silicate), into which o end of the filament is dipped; the filament is then flashed. valves a tiny strip of magnesium is volatilised by hig frequency induction; barium nitride is used in dull-emitt valves. Coming to high-vacuum gauges, they are describ in considerable detail and are classified into five groups: Those which depend on Boyle's law; (2) those which utili the frictional drag of molecules on a moving surface; those which measure molecular bombardment due to tempe ture differences; (4) those which depend on the fact that t thermal conductivity of a gas at low pressures becomes function of the pressure; and (5) those which make use the electrical conductivity of a gas. The chapter on pur speeds arrests attention by reason of its admirable discussi of many imperfectly explained operations, and is also rich suggestions for further research. Evidently the whole proble interests the author intensely, the various methods and pr cedure that have been suggested being described accurate and in detail.

On the matters of which he treats the author offers t fruits of a ripe and unique experience, and he has also t faculty, which those who are masters of their subjects not always possess, of describing essential features in simp terms. Dr. Kaye has made the best use of his wide kno ledge, and has handled the subject not only with skill discrimination, but also in a sober, scholarly, and scienti fashion.

The book is clearly printed, and some excellent illustratio and plates are included in the text, and much valuable inf mation has been brought together in an attractive setti and in a form convenient for reference purposes. The auth is to be congratulated on its compilation.

Makers of Science, Electricity and Magnetism. By D. Turner, M.A., B.Sc. Pp. xv+184; figs. 65. Londo Oxford University Press. Price 7s. 6d. net.

This small volume is not confined exclusively to biographic sketches of the great outstanding personalities who ha left their impress on the development of electrical scienc but gives, in addition, brief outlines of the principal contrib tions which they have made to this development. Beginnin really, with Petrus Peregrinus in the thirteenth century, t author deals in chronological order with the work of Gilbe of Colchester, and that of each of his successors who ha carried the torch of science up to our own times. It is fascinating record, and one which will bear re-reading ov and over again, because of the personal and human eleme with which the author has invested it. It would seem in dious almost to select one or more of those whose work dealt with here for illustrative purposes; but the mann in which the contributions to science by Faraday and Ma well have been treated is all that one could expect within t limits to which the author has restricted himself.

The field covered includes electrostatics, the electric curre electromagnetism, electromagnetic induction, the developme of electrical theory, electrolysis, the conduction of electrici through gases, and the electrical constitution of matter. the last chapter we are brought right up to the work of J. Thomson, Bragg and Moseley on the connection between ele tricity and matter; but, in the words of the author, "if v ask 'What is electricity?' we are left with an unanswer question." It is somewhat surprising to find, however, reference to the work of Eddington or of Jeans in the sphe of astrophysics, and the bearing that such work is having our knowledge of the constitution of matter and of its relati to radiation; but probably it is of too recent a date to adm of its incorporation in the book.

An introductory chapter on the need for a History Science is furnished by Dr. Charles Singer. There are illustrations throughout the text, including a number portraits; that of Faraday is particularly good. We hearti recommend the book as one which will be appreciated by t layman as well as the student of science.

The Elements of Radio Communication. By O. F. Brow M.A., B.Sc. (Oxon.), B.Sc. (Lond.). Pp. viii+216; fig 146. London: Oxford University Press. Price 10s. 6 net.

Mr. Brown is connected with the Radio Research Boar and is thus in an excellent position for reviewing the late developments of radio communication from the scientif point of view. He takes advantage of this fact by givir us in the last 50 pages an excellent summary of the up-to-da theories regarding directional reception, short-wave workin the propagation of waves and atmospherics. He says, v notice, in the directional portion, that the error of refractic in the case of waves crossing the boundary between surfac of different conductivity can be allowed for; this is hard so in practice as it varies with the distance between th stations. The remainder of the book consists of a non-math matical summary of the theory of radio telegraphy and tel

phony with a short summary of the principles of alternating currents as applied to radio circuits.

The author's difficulty is obviously how to cover the ground in the space at his disposal, and there is necessarily much omitted, such as machine telegraphy, methods of measurements, tuning-fork control, &c., which might be considered as coming within the scope of so comprehensive a title. We notice on page 43 that an earth screen is said to give better results than a buried earth, though it is known that this was not found to be the case in practice at the Rugby station.

The explanations are as a rule concise, lucid and free from mathematics except of the simplest kind. Some err, we think, from being so concise as to become sketchy, such as that of the Reinartz circuit on page 181, and we must confess to having difficulty in following the explanation of the magnetic amplifier on pp. 66 and 67, where a misprint of core for coil occurs, and of the elimination of distortion on pp. 160 and 165, where some of the letter references seem mixed. On p. 168, at the bottom, B is misprinted for B^1.

But these are minor criticisms; the book gives a good up-to-date summary of the principles of radio communication, and should be especially useful to electrical engineers who have not yet made a study of that branch of their profession. Admiral of the Fleet Sir Henry Jackson, who is chairman of the Radio Research Board, in an appreciative foreword, confidently recommends this book "to those who wish to get a clear understanding of this useful and fascinating art."

Published Specifications.

Trade Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from April 6th:—

Columbus. No. 477,580. Class 6. Electric floor polishing machines and vacuum-cleaning machines.—Columbus Suction Polisher Co., Ltd., 4, Broad Street Buildings, E.C.2.

K.G. (lettering and design). No. 475,841. Class 8. Electric batteries and apparatus and parts thereof for use in radio-telegraphy and telephony.—K.G. Battery Co., 16-18, Moult Street, Cross Street, Manchester.

Desmo. No. 477,415. All goods in Class 8.—Desmo, Ltd., 31, Stafford Street, Birmingham.

Supervox. No. 476,238. All goods in Class 9.—Société Française Radio-Electrique, 79, Boulevard Haussmann, Paris. (British representatives: Haseltine, Lake & Co., 28, Southampton Buildings, W.C.2.)

Pipon. No. 475,322. Class 13. Bulb and electric horns and similar audible warning devices.—C. Haseler & Son, Ltd., 94, Bridge Street West, Birmingham.

Lissen. No. 477,380. Class 13. Sparking plugs and electric irons.—Lissen, Ltd., Friar's Lane, Richmond, S.W.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

BILLINGHAM (Stockton-on-Tees).—Houses (233), for the Synthetic Ammonia and Nitrates, Ltd.

BILSTON (Wolverhampton).—Girls' high school, Wellington Road, for the governors; the clerk.

BIRMINGHAM.—Central fire station, junction of New Corporation Street and Aston Street (cost, including demolition of existing buildings and providing fresh offices for the Corporation Weights and Measures Department, &c., £200,000); city engineer and surveyor. Juvenile Court, Steelhouse Lane; Watch Committee. Treatment centre, General Hospital; city engineer. Extensions, Witton Babies' Hospital; city engineer. Hall, Alum Rock Road; Salvation Army.

BOLTON.—Kinema, Churchgate; G. E. Tong and F. Holt. Palais de Danse, Bridge Street; F. W. Meredith. Offices and transformer house, Moss Lane Colliery; S. Scowcroft & Sons, Ltd. Extensions, Temple Bleachworks; T. Cross & Co., Ltd. Extensions, Settle Street; Ocean Spinning Co., Ltd. 40 houses, Castlewood Square; Leigh Bros., Ltd.

BRIERLEY HILL (Staffs.).—Housing scheme (68), for the U.D.C.; John Yorke, surveyor.

BRIGHTON.—Zoological gardens, London-Brighton Road (£50,000); G. Bruce Chapman, proprietor of Barnet Zoo.

BROADSTAIRS.—Houses (36), for the U.D.C.; Gilbert Bros., builders, Bradstow Way.

BROMLEY (Kent).—School, Bromley Common, and two practical instruction centres, for the borough E.C.; Director of Education.

CAMBERLEY (Surrey).—Church, for the trustees of the Congregational Church; Rev. C. H. Pugh, B.A., pastor.

CHESTERFIELD.—Additional 50 houses, St. Augustine's estate, for the T.C.; borough surveyor.

CHESTER-LE-STREET.—Bazaar premises, for F. W. Woolworth & Co., Ltd., Kingsway, London.

CREWE.—Extensions to Memorial Hospital (£15,000), for the governors; P. Temperley, hon. sec.

DUKINFIELD.—Additional 105 houses, Clarendon Fields site, for the T.C.; borough surveyor.

DURHAM.—Additional housing schemes (108), Sherburn and Ludworth, for the R.D.C.; surveyor.

GLASGOW.—Factory in Kirkintilloch Road, for Blackie and Sons, Ltd., printers and publishers; the manager. Conversion of mansion house into mental institution (lighting and heating); clerk, Parish Council. Cinema, Summerfield Street, for Strathclyde Cinema Co.; the secretary. Factory in William Street, for James Templeton and Co.; the manager. Hall in Partick, for Salvation Army; Army Headquarters. 500 houses and 12 shops at Bilsland Drive, for Corporation; city architect.

GRAYS.—Girls' and boys' schools, with hostel and laundry (£84,000), for the governors of Palmer's schools; J. Stuart, county architect, Springfield Old Court, Chelmsford.

GUILDFORD.—Factory, The Bars; Guildford Glass Works.

GUISELEY.—School; Education Department, County Hall, Wakefield.

HARTSHORNE AND SEALS.—Housing scheme (60), for the R.D.C.; A. C. Clarke, architect, 73, Wood Street, Church Gresley, Burton-on-Trent.

HOLMFIRTH.—32 houses, Woodlands, Thongsbridge; P. Williams, clerk to the Council.

HULL.—Admission hospital and nurses' home, Mental Hospital; city engineer. Central library extension; city architect. 60 houses, Loveridge Avenue; W. H. Loveridge.

INCE.—Central schools, Rose Bridge, for Lancs. E.C. (£40,591); education architect, Preston.

IRISH FREE STATE (Cork).—200 houses; City Commissioner. Hospitals at Macroom, Bandon, Kanturk, Clonakilty, Bantry, and Skibbereen, including electric lighting (£100,000); South Cork Board of Public Assistance.
(Killarney).—Technical school; Kerry County Technical Committee.

KEMPSTON.—Extensions to works, for Cryselco, Ltd.

LANCASTER.—72 houses, for Corporation; F. Moore and Co., Morecambe.

LEICESTER.—Building for artificial light treatment, Groby Road Sanatorium; Symington & Prince, architects, for Corporation.

LEYLAND (Lancs.).—Additional 60 houses for the U.D.C.; surveyor.

LONDON (Becontree, E.).—Two additional schools, London County Council housing estate, for Essex C.C.; J. Stuart, county architect, Springfield Old Court, Chelmsford.
(Mile End, E.).—Elementary school, Cephas Street; A. E. Symes, for L.C.C. Education Committee.
(Stepney, E.).—Roman Catholic central school, Lucas Street; T. R. Ring.
(E.C.).—Buildings for *News of the World*, Bouverie Street and Whitefriars Street; A. A. H. Scott.
(Marylebone, N.W.).—Central library, Marylebone Road (£50,000); borough engineer. Reconstruction of premises, Oxford Street, Henrietta Street, Vere Street, and Marylebone Lane; Marshall & Snelgrove.
(Bermondsey, S.E.).—School for tuberculous children, Fort Road; L.C.C. architect.
(Eltham, S.E.).—Roman Catholic church, Well Hall housing estate; Rev. Abbot White.
(Aldwych, W.C.).—Offices, for the Indian Government (£300,000).
(Piccadilly, W.).—Theatre, corner of Denman and Sherwood Streets, for E. Laurillard; Messrs. B. Crewe and E. A. Stone, architects.

MARKET HARBOROUGH.—36 houses; U.D.C. surveyor.

MIDDLESBROUGH.—Constantine College (£65,894), for the borough E.C.; Stephen Easten, Ltd., builders, Newcastle-on-Tyne.

MOORTHORPE (South Elmsall).—Roman Catholic church and presbytery (£8,000); Holton & Fox, architects, Dewsbury.

NEWCASTLE.—Housing scheme on 432 acres, near city boundary; city engineer. Pavilion, Walkergate Hospital; city engineer. Sheds at Quayside; Wright, Anderson and Co., Ltd.

NEW MALDEN.—Extensions to mental hospital (£10,000), for Middlesex C.C.; W. H. Gaze & Sons, builders, Kingston-on-Thames.

NORTHAMPTON.—Improvements, Harboro Road hospital; borough engineer. Works extensions, Kingsthorpe Hollow; Northampton Foundry Co. Timber mill and store, Old Towcester Road; E. T. Trenery & Sons.

OXFORD.—Extensions, Merton Street; Corpus Christi College Wardens.

PLYMOUTH.—Education offices, Cobourg Street; Education Committee. Electric lighting improvements, Museum and Art Galleries; borough electrical engineer. Extensions, Municipal Offices, Guildhall; borough engineer. 52 houses, Mount Gold; Astor Housing Trust. Additions, depôt, Manor Street; Dunlop Rubber Co., Ltd. Motor showrooms, stores, &c., Stuart Road; W. S. Reed.

RAMSGATE.—Dance hall, &c., with electrical equipment, Harbour station site; William Thompson, 2, Burleigh Mansions, Charing Cross Road, London.

REIGATE.—Printing works, off Cavendish Road, Redhill, for the Surrey Fine Art Press. Additional housing scheme (44), for the T.C.; borough surveyor.

ROTHERHAM.—Additional housing schemes (66), Dalton and Bramley, for the R.D.C.; surveyor.

ST. HELENS.—Secondary school, for the borough E.C.; Biram & Fletcher, architects, George Street.

SEDGEFIELD.—Additional 50 houses, for the R.D.C.; surveyor.

SHERBURN (Co. Durham).—Extensions to hospital; Joseph Potts & Son, architects, 57, John Street, Sunderland.

SOUTHPORT.—Houses (52), for the T.C.; Leonard Livesey and Peter Sutton, builders.

STOCKTON-ON-TEES.—Shops, Leven Road, Norton, for the Co-operative Society; secretary.

UPMINSTER.—School (£11,965), for Essex E.C.; J. Stuart, county architect, Springfield Old Court, Chelmsford.

WAKEFIELD.—County offices, Wood Street; clerk of the County Council.

YORK.—Warehouse, Wiggington Road; Rowntree & Co., Ltd.

The

Electrical Review

VOL. C. APRIL 22, 1927. No. 2,578.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

The Chancellor and Oversea Trade.

OUR comment regarding the future of the Department of Overseas Trade had gone to press last week when the Chancellor of the Exchequer delivered his Budget speech.

Successive governments have in their search for economy turned their attention to the new Departments created since the outbreak of war in 1914, and for some reason or other their eyes have turned upon the Department of Overseas Trade with a distinctly reproachful look—an unnecessary member of the family, a late arrival, a small, harmless, comparatively inexpensive creature, but *such* a millstone round the neck of its parents!

How did this unwanted child come into existence? Was it not once the puny offspring of two Departments of State, namely, the Board of Trade (Commercial Intelligence Branch) and the Foreign Office? Was it not felt that by such a combination, efforts of a divided and scattered character could be concentrated and that a necessary service could be rendered to the trading interests of the nation—a service for which there was a need, they having been sadly neglected in earlier years? And does not the business world in 1927 pay unmistakable tribute to its usefulness?

The Ministry of Transport is to be abolished "as a separate department," while some of its activities will be continued; the functions of the Mines Department are "to be distributed," and, says the Chancellor, "The Prime Minister has also decided that arrangements shall be made during the present financial year to . . . *terminate the separate* existence of the Overseas Trade Department." Note that our Herod does not propose

to present three heads on a charger for the delectation of the modern Salome, who dances for economy at all costs. The precise words may possess special significance. It is one thing to abolish a Ministry as a separate department; another to distribute the functions of an unwanted department; and may be something else altogether to "terminate the *separate existence*" of a third. We shall have to wait and see exactly what is meant when the promised legislation relating to them is brought before Parliament for consideration. But we do hope that somebody who remembers what happened in the old days when trade intelligence matters received such poor attention under the divided control of the Board of Trade and the Foreign Office will have an influential voice in settling what the future shall bring. The last thing in the world that anybody ought to want is a return to pre-war inefficiency in this connection as in the days when the Commercial Intelligence Branch of the Board of Trade was the Cinderella in a Basinghall Street kitchen.

Sir Eric Geddes with his axe wanted to cut off the Department of Overseas Trade's head years ago; yet he was once a president of the Federation of British Industries. It used to be said in those days that the F.B.I. had no use for the Department—that its own organisation sufficed. But since the Chancellor made his speech, one of the most important objectors to the proposed change has been Sir Max Muspratt, the present president of the Federation. The Chambers of Commerce of the United Kingdom, whose voice should also carry weight, are strongly in favour of its retention. We cannot think that either the Prime Minister, whom the Chancellor credits with the decision, or the Chancellor himself, can be alive to the overseas trade information-getting activities of governments in competing industrial countries, or they would not advocate a reduction of operations by this country when we are faced with a very stiff competitive contest for our so essential export trade.

We do not criticise the policy of abandoning unnecessary departments and striving after economy; nor should we object to the reorganisation of the Department of Overseas Trade if it were found to have added needlessly to the number of ornamental officials. What we are anxious about is that the useful service that experience proves it able to render shall not be scrapped; that the future of the work of our Trade Commissioners shall not be of less but of greater value; that the British Industries Fair shall be developed still further from year to year; and that the ceasing of a "separate existence" shall not mean that the experience accumulated by and recorded in the Department will be smothered among the multiplicity of interests in a department which, like the former Board of Trade and a distinguished old woman living in a shoe, had so many children that none of them received the proper share of attention.

In doubt as to what the Chancellor means, the first impression is that, if the worst comes, it may be necessary for the individual manufacturer and trader more earnestly to seek out his own information to the best of his capacity; for trade associations to organise themselves for more efficient collection of information from oversea markets for the benefit of their members; and for organised and unorganised traders alike to enable the trade Press to increase still further its trade information-collecting services.

London's Traffic.

All who have read the recent report of the Royal Commission on Cross-River Traffic will agree that, so far as road transport is concerned, their recommendations embody a far-sighted and effective scheme for the relief of many of London's traffic difficulties. We were glad to read the Prime Minister's announcement that the Government proposed to support the main outlines of the scheme, and had asked the Southern Railway and the L.C.C. to co-operate in the appointment of engineers to prepare designs for the proposed double-deck road and railway bridge at Charing Cross.

While we admit the comprehensive nature of the scheme, as far as road transport is concerned, it must be a matter of regret that, with regard to railways, the proposals might (with one exception) have been made in the days of steam traction. The only reference to electrification (embodied in the thirteenth appendix to the report) is that the Southern Railway Co. regards it as "a temporary palliative." The only development in this direction is that the double-deck bridge at Charing Cross excludes steam traction from this small section of railway which, under the present policy of the Railway Co., is of decreasing importance. A wider conception of the advantages which electrification offers, particularly in the way of underground traction, would surely have given rise to some scheme by which the present congestion, both on rail and road, at the many terminal stations of the Southern Railway could have been reduced or even removed.

It is proposed to spend £12,500,000 in the central area, in which is included the cost of a new railway bridge and station at Charing Cross, and a new station and a considerable length of new track at Holborn Viaduct and Blackfriars. In spite of this very substantial expenditure, the railway facilities will not be in any way improved, but rather, if the fears of the Southern Railway are justified, slightly restricted.

At the present time there is a tendency to think of development almost exclusively in terms of road transport. Certainly since 1921, the 'bus passengers have increased from 932 million to 1,671 million passengers per annum, while railway passengers (including the tubes) have fallen from 912 to 875 millions. At a time when road traffic is increasing at such a rate that it is difficult to see how the roads are to be made adequate for their task, it is as much to the advantage of the roads as of the railways that rail facilities should be so developed as to induce as many passengers as possible to return to the trains. If, as seems possible, a practicable scheme can be developed to achieve this, it is to be hoped that it will secure the support of the engineering industry and, in due course, of the general public and the traffic authorities.

Improving the Load Factor.

The secret of cheap electricity does not reside in power stations or mains or any other engineering device—it is above all a question of management. The aim should be to produce the maximum output of energy with a given capital outlay; to fill up the valleys of the daily, weekly, and monthly load curves, so that the plant is used at full load for, if possible, the whole time. Then the cost of the kilowatt-hour is little more than the cost of fuel, which is not much even in a small station—and under such conditions of loading, old and inefficient plant can be replaced by new without materially affecting the unit cost.

In considering the probable future character of the domestic load, elsewhere in this issue, Mr. E. G. Ross is somewhat concerned because, according to his synthesis, that load appears to be "peaky"; but we would point out that the shape of the curve of each class of load is immaterial provided that the peaks of one class are not superposed upon those of another. In other words, search should be made not necessarily for loads with good load factors of their own, but for loads which occur or can be made to occur at times when other demands have fallen off. The heating of water during the night is a typical example of a most desirable load in this respect, as Mr. J. W. Meares points out, and we may add that whilst the heating of houses throughout by electricity is at present neither satisfactory as a fill-up load nor, in general, commercially practicable, the heating of the water supply is both, even under existing conditions. Hence station managers should do their utmost to develop this valuable load by offering attractive terms.

Wireless "Beam" Communication.

Details of the short-wave stations built for the Imperial Telegraph Service between England and Australia.

THE short-wave "beam" wireless-telegraph stations built for the British Post Office by Marconi's Wireless Telegraph Co., Ltd., for communicating with Australia have fulfilled the conditions specified, for their guaranteed capability of maintaining communication at a speed of 500 letters per minute

Fig. 1.—The Grimsby "Beam" Telegraph Station.

each way (exclusive of repetitions necessary to ensure accuracy) during a daily average of seven hours, was demonstrated by actual working for seven consecutive days, between March 7th and 14th.

Amalgamated Wireless (Australasia), Ltd., which is operating the service in Australia, reported that during the first six days of the test the average number of words telegraphed each way per day amounted to 148,000, which is equivalent to a speed of 103 five-letter words per minute each way throughout the whole 24 hours. This average was raised to substantially 150,000 words per day, and on many occasions traffic was dealt with at a speed of 225 words per minute, whilst high-speed duplex communication was carried on during the seven days for an average period of over 13 hours per day.

The engineer-in-chief of the Post Office (Col. T. F. Purves) has issued to Marconi's Co. an official preliminary certificate to the effect that the stations have satisfactorily fulfilled the conditions required, *viz.*, "of being capable of sending and receiving at the same time to and from the Australian stations 100 words of five letters each per minute during a daily average of seven hours in accordance with Clauses 6 and 17 of the 'beam' agreement."

In a letter to Mr. R. N. Vyvyan, engineer-in-chief to Marconi's Co., Mr. E. H. Shaughnessy, assistant engineer-in-chief of the Post Office, states that the Post Office scrutiny of the results of the seven days' trials indicated that effective both-way communication in accordance with the terms of the contract was maintained for a total time of 88.5 hours during the week (the contract required a total time of 49 hours only).

The receiving station in Australia is situated at Rockbank, near Sydenham, 15 miles from Melbourne, and the transmitting station near Ballan, 50 miles north-west of Melbourne. The service was opened for public use on April 8th, the English stations being similar to the Canadian service stations*; as the latter will be shared by the South African service when ready, so will those illustrated herewith be utilised for the service to India also.

The Grimsby Station.

The transmitting station at Tetney, six miles S.S.E. of Grimsby town, is 25 ft. above sea level: the aerial for the Australian "beam" extends N.N.W., and that for the Indian system extends south. Fig. 1 is a view of the station, the machinery hall being on the left and the transmitter room to the right; the left of the picture faces east. The transmitter delivers 20 kW to the valves of the main, or last, stage of magnification, which feeds the aerials.

Power Plant.—Electricity is obtained from the Grimsby Corporation by an underground cable, delivered as 3-phase, 50-cycle power at a normal pressure between phases of 6,300 volts, and is transformed by a delta-star 250-kVA bank of three single-phase transformers to 3-phase, 400 volts between phases and 230 volts single-phase to neutral for lighting and heating the station buildings. The transformers (by Messrs. Johnson & Phillips, Ltd.) feed through an l.p. switchboard in the machinery room: (*a*) Three alternators (by Crompton & Co.), each of 50 kVA, single-phase,

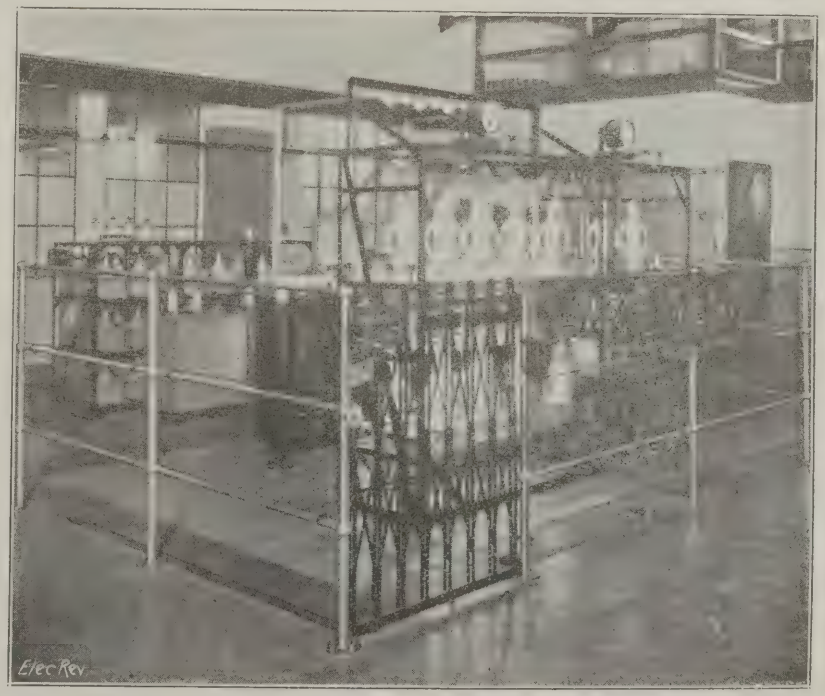

Fig. 2.—The Valve Rectifier Plant; "Smoothing" Condensers Behind.

* Elec. Rev., October 29th, 1926.

at 1,000 volts, 300 cycles, for supplying from 8,000 to 10,000 volts to the anodes of the transmitting valves, after passing through special single-phase, step-up transformers, and the valve rectifying and smoothing apparatus; (*b*) three alternators (by the Electric Construction Co.) each of 1.5 kVA single-phase at 220 volts, 500 cycles, for energising at 2,000 volts the anodes of the valves in the drive (or master oscillator) panels of the transmitters, through special single-phase, step-up transformers and valve-rectifying and smoothing apparatus; (*c*) three alternators (by the Electro - Dynamic Construction Co.), each of 10 kVA single-phase at 500 volts, 300 cycles, for heating the filaments of the main and drive rectifying valves at 11 to 12 volts through step-down transformers; (*d*) three generators (by Messrs. E. R. and F. Turner, Ltd.), each of 7½ kW d.c. at 24 volts, one for each transmitter, to supply the filaments of the oscillator and absorber valves and also to charge the batteries which heat the filaments of the master-oscillator valves; (*e*) two d.c. generators (by E. R. & F. Turner, Ltd.), each of 12 kW at 110 volts for exciting the alternators and the control and signal relays. The motor control pillars were supplied by the Airedale Electric Manufacturing Co., Ltd., the switchboards by the Harland Engineering Co., Ltd., and cables by W. T. Henley's Telegraph Works Co., Ltd.; Stanley Cooper & Co. carried out the electric lighting installation, and a two-ton hand-operated travelling crane by Herbert Morris, Ltd., spans the machinery room.

Fig. 3.—The Transmitter Room: Australian Service Plant on Left and Indian Service Gear on Right.

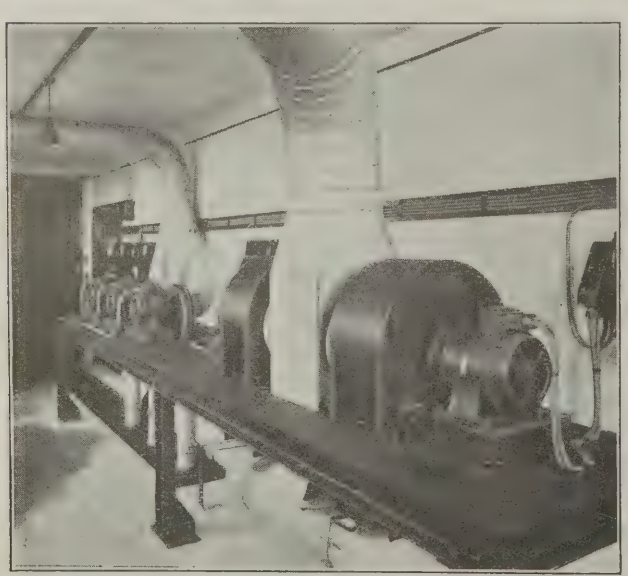

Fig. 4.—Valve and Absorber Mat Cooling-air Blowers.

Batteries.—Four 8-cell, 16-volt, 420-amp.-hour batteries by the Hart Accumulator Co. (two being used alternately for each transmitter) supply the filaments of the oscillator valves in the drive and No. 3 magnifier panels. Two 400-volt, 5-amp.-hour unpasted lead batteries, each consisting of 220 cells, supply negative voltage to the grids of the magnifier and sub-absorber valves. Two 200-volt batteries and 6-volt portable ones work the local heterodyne oscillator listening set.

Radio Plant.—One main and one drive rectifier (two sets) provide the high-voltage d.c. anode supplies for each transmitter: each main rectifier carries a bank of 16 MR7a valves, and each drive rectifier two MR7a valves. The main power transformers were manufactured by Ferranti, Ltd., and the main rectifier-filament transformers by Johnson & Phillips, Ltd. Control tables are mounted between the two transmitters, which face each other. In the case of the Indian transmitter (fig. 3, right) isolating links have been provided for changing over the anode supplies to either of the two "drive" panels, each of which is tuned to one of the two wave-lengths for which the transmitter is designed.

The two high-speed keying relays are of the A.T.M. standard type, and a 4-pole change-over switch enables one or the other to be put into use instantly. The wireless transmitting apparatus and rectifiers were designed and constructed at the Chelmsford works of the Marconi Company, and the valves used were manufactured at the M.O. Valve Co.'s works in London. The brick buildings were constructed by Holloway Brothers, Ltd. Water for the requirements of the station is obtained from a well. Fig. 4 shows, in the background, the three Sturtevant blowers which supply cooling air for the seals of the main magnifier valves, whilst in the foreground can be seen the two blowers which furnish air for cooling the absorber mat resistances through which the load is shunted from the magnifiers when the transmitting key is "spacing." This method of keying has the great advantage of needing only one small relay between the land-line and the transmitter, which means only one small mechanical motion.

Controls.—On the control tables (fig. 3, centre) are three potentiometer-type regulators, one controlling the voltage of each main power alternator, and three similar regulators for the voltage of the drive-power alternators, thus giving complete control in the transmitter room of the high voltages from the power house. There are also two filament control tables, one for each transmitter, carrying variable resistances for varying the filament current in easy stages; they are completely cut out during the normal working of the set. Variable resistances on the transmitter panels themselves allow for slight differences in filament voltages of similar types of valves and for minor variations on the main

filament busbars; there is a separate control for each valve.

Other tables carry land-lines controlling instruments and the local heterodyne oscillator set by which the outgoing signals can be checked or listened to. There is also a standard wave-meter for checking the length of the wave being radiated.

Call Letters and Wave-Lengths.—The Indian transmitter is arranged for signalling on two wave-lengths of approximately 35 and 16 metres, one of which will be used for night and the other for daylight communication. The call-letters of the England-India service are GBI. The Australian transmitter is arranged for transmission of signals to Australia on a single wave-length of approximately 26 metres. The call letters of the England-Australia service are GBH.

Masts.—In the case of the Indian service, there are five masts in a straight line, at right angles to the great circle bearing to India; they carry the vertical aerial and reflector wires which project the beam. In the case of the Australian service, there are three masts only in a straight line, at right angles to the great circle bearing to Australia; they carry two parallel rows of vertical aerial wires with vertical reflector wires fixed between them, which arrangement makes it possible to project a beam along the great circle to Australia in either easterly (evening, 9,000 nautical miles) or westerly (morning, 12,000 miles) directions.

The masts (manufactured and erected by Messrs. Francis Morton & Co., Ltd.) are of steel lattice construction and weigh 38 tons; they are of square section 12 by 12 ft. The overall height of the masts is 287 ft. in the case of the Indian masts, and 260 ft. in the case of the Australian masts; the top steel cross-arms, weighing 3 tons, are 90 ft. long. The masts are spaced 650 ft. apart, and the total length of the line of the five Indian masts is 3,150 ft., and 1,300 ft. less in the case of the three Australian masts.

Aerials and Reflectors.—For the Indian service (two bays for each wavelength) each of the two 35-metre bays has 16 vertical aerial and 32 vertical reflector wires; in each of the 16-metre bays there are 24 vertical aerial and 54 vertical reflector wires. For the Australian system there are two parallel aerials, back to back, with one reflector fixed between them, each having 16 vertical aerial wires per bay, and the reflector, common to both aerials, consists of 32 vertical wires per bay; in the aerial wires phasing inductances are inserted at intervals. The reflector wires are made up of insulated lengths, and the distance between the aerial wires and between the aerial and the reflector wires bears a definite relation to the wave-length employed. The wires are suspended on the "double-catenary" system, and the lower end of each is made fast to a balance-weight structure.

Feeder System.—The high-frequency current from the transmitter-house is conveyed to the aerials through a feeder system consisting of two concentric copper tubes, the inner one centred in the outer by porcelain insulators. The outer tube is earthed and carried on iron standards driven into the ground. Very careful attention was needed to ensure mechanical and electrical symmetry within fine limits throughout its length.

The Skegness Station.

The "beam" receiving station at Winthorpe, about two miles N.N.W. of Skegness, has open country around it in all directions. Power is generated by two 18-h.p. Aster two-cylinder petrol-paraffin engines directly coupled to two Metropolitan-Vickers 10-kW dynamos supplying a 110-volt main switchboard for charging the battery used for lighting the station and for driving four motor-generator sets (by the Crypto Electrical Co.), two of which sets charge the 4-cell filament batteries and two the 110-cell anode batteries; the plant is thus duplicated throughout. The batteries are of Tudor make. The receivers stand near the wall where the feeders enter the building. At one end of the room is a table for the recording apparatus and land-line apparatus (fig. 5): on the left can be seen a key and P.O. "omnibus" sounder for communicating with the transmitting station and the Central Radio Office in London for control purposes; next are two sets of high-speed recording apparatus (Marconi UG.2 type), with tape pullers to the left of each (fig. 6 is a close-up view of one set); and on the right is a Wheatstone transmitter for land-line testing purposes. The received signals are put direct to line through A.T.M. high-speed relays, and can be checked for formation by means of undulators.

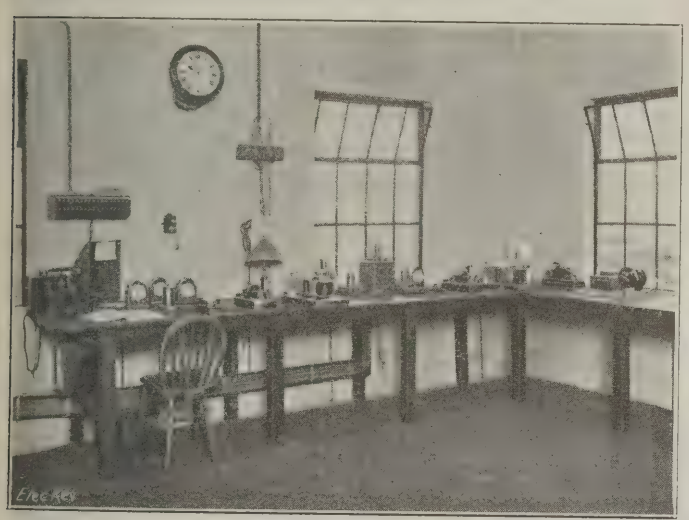

Fig. 5.—Receiver Room; Land-line Apparatus.

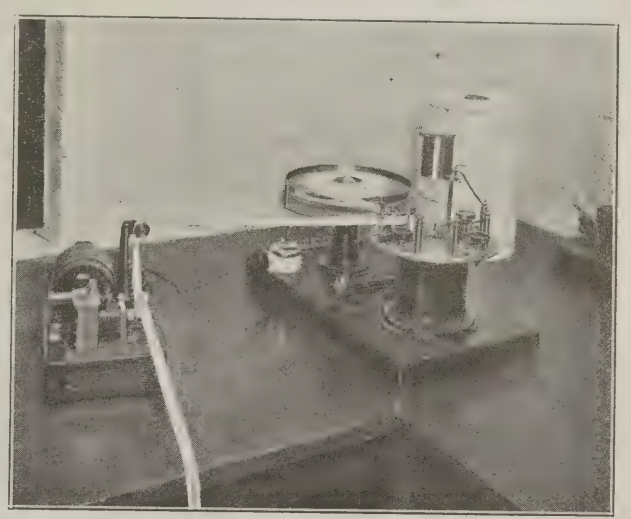

Fig. 6.—High-speed Automatic Siphon Recorder.

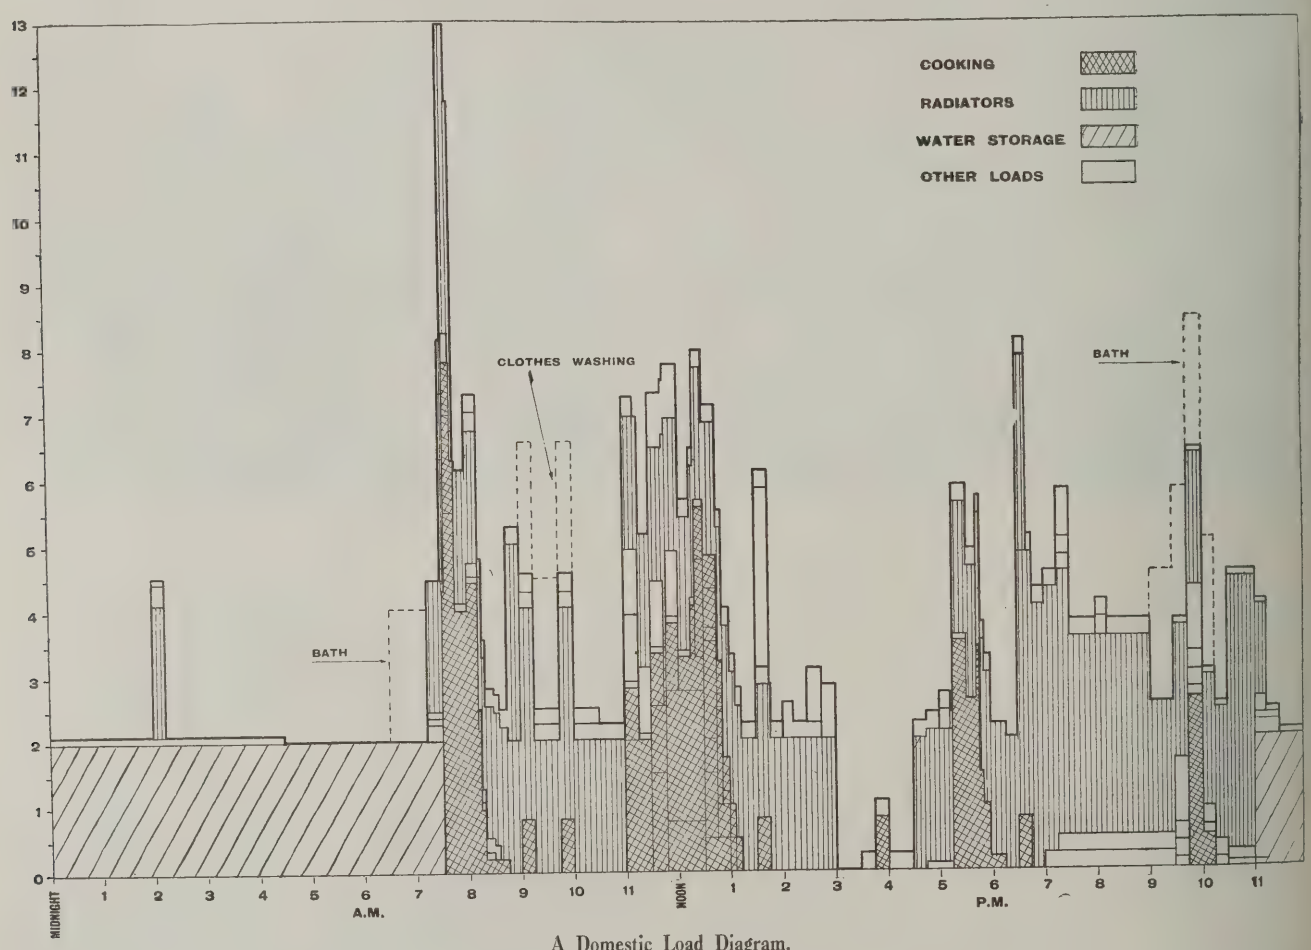
Aerials.—The masts, receiving aerials, reflectors, and feeder system are duplicates of those at the Grimsby transmitting station. The masts are at right angles to the direction from which the signals are received, the effect of the reflector wires being not only to screen the aerial from signals coming from behind, but also to reflect back to the aerial energy received from the front of the system exactly in phase with that directly induced.

Receivers.—Each of the two Marconi short-wave beam receivers consists of 10 units, each contained in a copper screening box to obviate interaction. They are mounted in a vertical iron rack, enabling them to be adapted for any special purpose by simply replacing one or more units.

The receiving and recording apparatus was designed and manufactured at the Chelmsford works of Marconi's Wireless Telegraph Co., Ltd. The valves were manufactured by the M.O. Valve Co., cables were supplied by W. T. Henley's Telegraph Works Co., Ltd., and motor starters by Veritys, Ltd.

The Domestic Load.



Suggestions for its improvement based upon a detailed analysis of its constituents, and of the periods during which electrical apparatus is in operation in the home.

By E. G. ROSS, A.M.I.E.E.

THE country's Domestic Electrification Scheme reaches out to secure the conversion of a load, the exact dimensions of which, as a whole, are probably beyond computation at the present time, and of which, in its individual parts, not nearly enough is yet known. It is, however, already time to look to the future, particularly having regard to the Ministry of Health's tendency towards the subsidising of cheaper houses than hitherto, and to the similar tendency of private building schemes.

so forth, while the larger-sized dwellings are decreasing purely on account of first cost, and the more efficient expenditure of money. It is, therefore, safe to say that the average electrified house of the approaching future will comprise four residential apartments plus a kitchenette (*i.e.*, two bedrooms, living or dining room, drawing room, and kitchenette).

The daily load of such homes must develop primarily in proportion as electricity is regarded as a convenience. The present margin between "all-electric" and other

A Domestic Load Diagram.

Also, the effects of the E.D.A -E.L.M.A. campaign are beginning to be felt. Although the gross results will not be known for some time, they are undoubtedly certain.

Again, however unpopular the Government's electricity measure may be with the profession, that it *is* popular with the lay mind is apparent to the veriest electrical tyro. Electric power, generally, could not have had a better advertisement, and the exceptional psychological effect of the Bill on the lay mind will be felt in trade circles before very long.

The potential consumers concerned at present occupy residences of from three to seven apartments (including kitchenette, &c.). The lower-sized homes are expanding on account of desire, prevention of overcrowding, and house costs is too fine to influence domestic electrification as much as is desired; but the "convenience" load must, in time, alter this state of affairs. American development has shown that immediately the "convenience" movement began to take effect, practically every power undertaking of note had its hands full (day load). Human nature being much the same the world over, it is reasonable to apply the same principle to this country. Consequently "convenience" load will ultimately result in "cheap power" load, other factors being equal; and this, in its turn, will influence still greater "convenience" loading.

Therefore any daily-load characteristic that is considered should take account of the "convenience" aspect of the home, and it is suggested that provision

must now be made in mains, to accommodate a future average connected load made up as follows:—

Lighting	.950 kW
Radiators	5.000 ,,
Cooker	7.000 ,,
Hot water (heat storage) ...	2.000 ,,
Kettle (two pint)	.800 ,,
Coffee jug	.500 ,,
Child's milk heater	.300 ,,
Toaster	.600 ,,
Table hot-plate	.200 ,,
Bed warmer	.100 ,,
Iron (5½ lb.)	.450 ,,
Wash boiler	3.000 ,,
Washing machine	.350 ,,
Vacuum cleaner	.250 ,,
Fan	.070 ,,
Refrigerator	.250 ,,
Curling-tongs heater	.750 ,,
Hair-drying blower	.200 ,,
Violet-ray apparatus	.060 ,,

giving a total connected load of nearly 23 kW; not a negligible load by any means! Nor an impossible one; for at the present time the same average "all-electric" house has a connected load of:—

Cooker	7.000 kW
Lighting	.750 ,,
Iron	.450 ,,
Kettle	.800 ,,
One radiator	2.000 ,,
Vacuum cleaner	.250 ,,

or about half the suggested future connected load figure.

Already that figure has been variously estimated at between 17 kW and 25 kW, the lower figure relating to this country (see several I.E.E. discussions). This is probable if such things as refrigerators, washing machines, and similar apparatus are left out of account, but only first cost will rule them out, not convenience, which is again accented as the immediate domestic pulling point.

Should the reader question the necessity for certain of the items cited, he must remember that the house is considered to be quite "all-electric,"—no coal or gas whatever being used. Further, the effect of the new law relating to foodstuffs cannot be ignored, as it is probably only the thin end of a powerful wedge. Nor can the constant upward tendency of the general standard of living be neglected. Each of the stated items has only been included in the light of some years' experience in a large city.

Average power consumption figures have been taken. Makers are so diverse in their power requirements for any given type of utensil that average figures, indeed, afford the only possible basis. Thus, while .95 kW of lighting is fairly definite, and the 7-kW cooker is almost universal, radiators and fires to heat the same cubic space may vary between 3.5 kW and 6 kW according to type. Allowance has been made for five portable 1 kW radiators arranged two in the drawing room, two in the dining or living room, and one for bedroom use, to be supplemented by one of the others if and as necessary. Experience shows the greatest convenience to result from this arrangement.

A point arises in connection with the cooker. The most modern cookers utilise enclosed, or solid type boiling rings, and these are rated at about 10 per cent. less wattage than for the older open type. Further, the new rings cook the same amount of foodstuffs in but 60 per cent. of the time taken by the open rings. Hence the total power consumption is very appreciably less than obtained hitherto, so that 7 kW might be thought an outside figure. For some areas this may hold. However, a decided inconvenience in the old cookers is the lack of a *third* boiling ring. The demand for a third, low-power boiling ring now becomes insistent, and it is gratifying to note that some makers are incorporating the extra ring in their latest products. With more efficient boiling-ring construction, and, particularly, much needed improvement in the (heat) insulation of them from the top plate of the cooker, it may be presumed safely that in the near future three boiling rings per cooker will be the regular feature, and these rings will not consume any more power than is now taken by two. Thus 7-kW cooker maximum demand is a reasonable figure.

The geyser type of water heater is not included. As a station load, it is not regarded with favour, the ideal for domestic purposes being an all-night automatically heated and well lagged tank. The very large improvement in station load factor with many such tanks as connected night load must oust the geyser ultimately for most domestic purposes. As it is, the storage tank in conjunction with a kettle and an electric wash-boiler suffices amply for usual needs. For washing greasy dishes, it is usual, and indeed, proper, to fill either the kettle or the wash-boiler with the requisite amount of water already made hot in the storage tank, thereby connecting the intermittent water-boiling load for the shortest possible time. Such an arrangement is advantageous to both station and consumer. Two kilowatts of night load for water storage is thought to meet most needs, although for bathing, a booster heater of 2 kW is sometimes necessary. Some comments are made later on this point.

The coffee jug and child's milk heater have already made great strides, the latter especially proving of very considerable value in the early morning hours where young families have to be attended to. Power here again varies widely with make (and also size).

The toaster is likewise a great convenience, although economy sometimes results if the cooker grill is used. Generally, however, toast made under a grill is less satisfactory than that made in an enclosed receptacle designed for the purpose (which method, by the way, has medical approval).

The undeniable convenience of the table hot-plate is already reflected in its sales, although were ovens used properly, it could be done without. Unfortunately perfection on both sides of the house being the exception rather than the rule, an auxiliary is rather necessary to take care of "lost my train," "detained at the office," &c. With a cover over the foodstuffs, 200 W is sufficient to keep most articles palatably hot after removal from the cooker.

The bed warmer begins to be appreciated. It is a great convenience to have no "skittling" with hot-water bottles, red flannel, and so forth. Incidentally, as a night load, even though a small one, it is valuable to the power station. The principle of "many pennies to the pound" is too important to be neglected where night load is concerned.

The iron needs little comment, except perhaps that its future size is likely to increase rather than decrease. The beautifully smooth action of the electric iron lends itself to a rather heavier iron being used, with its corresponding advantages.

The wash boiler is a necessity, as will be seen from the above remarks about geysers and, like the storage tank, it may require an auxiliary heater of an extra kilowatt.

The refrigerator is a new thing for domestic use, but it must, in time, become essential. The tendency of all legislation is towards the sale of "natural" foodstuffs only, which keep but for a short time, and, while a point of controversy arises as to whether the home or the grocer's shop will contain the refrigerator, preference has here been given to the home, having regard, primarily, to convenience. Power consumption varies according to type, compressor apparatus naturally taking considerably more power than the purely thermo-chemico-static type. Probably the latter will find favour on account of first cost, and a low power figure has therefore been taken.

The last three items belong to my lady's perquisites. Has any engineer the temerity to doubt the future demand for these articles? The violet-ray apparatus may be slower in gaining appreciation than the others,

but to draw attention to the fabulous amount of money spent by womankind on hairdressing and beauty culture is surely sufficient answer.

The lighting load figure is not high, having regard to artistic sense, and the certain raising of the general standard of living and illumination all over the country.

Certain loads cannot be properly reckoned as regular daily features. These are (1) provision of water for baths, which, with a household of four, may be taken as necessary every second day; (2) water for clothes washing, &c., which involves the use of the extra heaters in the boiler and storage tank, and also the use of the washing machine; (3) the fan, which is very intermittently used in this country and of less account than any of the other loads; and (4) the iron, used on an average not more than twice weekly. Individual personal characteristics reflect upon these loads more than anything else, and it is therefore difficult to allocate to them a definite time per day. It is quite conceivable that they may all come on together. Their approximate position on any day's load curve, however, is indicated by the dotted lines in the diagram, two alternative times for bathing being shown.

Thus the suggested connected load could hardly be termed grandiose. Criticism of it must vary, depending upon the customs and habits of the reader. A South Wales reader lives differently from a London or Glasgow reader, and his ideas of necessity and convenience differ accordingly. But it is thought that the suggestions will cover fair average instances.

How are these loads disposed throughout twenty-four hours' working?

The load diagram on p. 630 has been computed on the basis of some years' observation and experience of a number of users residing in "all-electric" homes, and a measure of its accuracy may be gained if the cessation of the properly mid-day load at 1.15 p.m. be noted. The daily load curves of most large power stations in this country show very definite clefts about 1 p.m., *i.e.*, when most industrial establishments have closed down for the mid-day meal. (Typical curves for the Dalmarnock station are to be found in Vol. 64, p. 294, *Journal*, I.E.E.) The two times tally sufficiently well for the present comments. The diagram refers to an average spring day.

Probably the most striking point is the exceptional irregularity of the loading. From the disturbance caused by baby at 2 a.m. until lights out at 11.30 p.m., the succession of peaks is quite unique. The main trouble (if such it may be called) originates in the cooking load and in the use of the smaller intermittent loads, the latter having a very disturbing effect. The staple loads are the water-storage load during the night, and the radiator load during the day, the latter being broken only from 3 p.m. to 4.30 p.m. It is conceivable that in many instances the radiator load is rarely broken at all.

The diagram might have been improved had it been built upon these loads as foundations, but, originally, it was particularly desired to examine the cooking load conditions, and these were first plotted. The final shape of the curve holds, of course, either way.

The cooking load (which includes kettle and coffee jug, &c.) is very complex, as will be seen from that part of the curve representing the mid-day position, in which the constituent parts of the load have been fully indicated. The actual switching operations here are as follows:—

11 a.m.	Large boiling ring ...	full
	Kettle	on
11.15 a.m.	Kettle	off
11.30 a.m.	Large boiling ring ...	med.
	Small boiling ring ...	full
	Kettle	on
11.45 a.m.	Oven	full
	Kettle	off
11.50 a.m.	Small boiling ring ...	med.
12.00 noon	Large boiling ring ...	low
12.15 p.m.	Kettle	on
12.20 p.m.	Grill	full
12.30 p.m.	Small boiling ring ...	low
	Kettle	off
	Coffee jug	on
	Oven	med.
	Table hot-plate	on
12.45 p.m.	Large boiling ring ...	off
	Oven	low
12.50 p.m.	Grill	off
1.00 p.m.	Small boiling ring ...	off
	Table hot-plate	off
1.05 p.m.	Oven	off
1.10 p.m.	Coffee jug	off
1.30 p.m.	Kettle	on
1.45 p.m.	Kettle	off

The remainder of the diagram has been built up similarly.

A probable danger point is 7.30 a.m., at which time circumstances may arise to cause annoyance. By far the largest peak occurs here, as will be seen from a case in point. A friend converted his establishment by degrees to one almost wholly electrical. That is, he installed a cooker, followed it later by a radiator, and so on, some months elapsing ere the change-over was complete. One morning he decided to have a hot bath immediately after rising. The weather being frosty, all the radiators were in use. Practically the full connected load was switched on at one time. The cable drop was sufficient to delay the cooking operations by about fifteen minutes, likewise the hot bath, which cost the bather his train and his temper. Conceivably, the point could be of importance in a given area, and, it is thought, to avoid the cost of excessively heavy main and sub-cables to cope with a very short high-peaked load, the time switch on the hot-water tank might be arranged to switch in the booster heater from, say, 6.30 a.m. to 7 a.m. At the appropriate time the cable would then be free to take the normal cooking and heating load.

The morning load appears to be the least favourable. The mid-day load is much better, and the evening load between the two. (Where late dinner is the rule, the mid-day and evening loads shown will, of course, be interchanged.)

On the whole, the domestic load peaks occur synchronously with the station load clefts, which is satisfactory. But the domestic load itself leaves room for improvement. Thus its own load factor is not brilliant, and there is scope for at least two methods of improving it.

One is to alter the rationale of cooking; rather a tricky job from the human nature point of view, but the Seves cooker points the way. A reversion to the "paper-bag" or "hay-box" method would be welcome from both the load factor and the consumer's points of view. Thus, if the morning's breakfast were put into an electric "hay box" or similar arrangement, and heated by the *night load*, inestimable advantage would accrue all round. The consumer would be saved much trouble in the morning, and given very little last thing at night. The food would be cooked ideally from the medical aspect, power would be very cheap, and station load factor would benefit enormously.

The idea is far from being impracticable. All that is necessary is a thermostatically controlled "hay box" and a time-temperature cooking chart. The former is an easy practical proposition, and the latter is already made quite feasible in an ordinary electrically-heated oven. The suggestion is made in all seriousness, for the question of load factor is vitally important. Electrical education ought to be directed with all the energy possible toward the attainment of cheap power through the improvement of station load factor, more particularly in view of the enormously costly transmission network about to be erected. From some years' experience and observation of electric cooking operations, the writer considers the electric "hay box" to be a perfectly practicable proposition, particularly when the

feminine mind realises the large decrease in power bills which would result from its use.

The second means of improvement lies in the sale of "convenience" apparatus designed to be used between the cooking peaks. The vacuum cleaner is an example, but is, in itself, a peak load, and therefore not of the best. To those who can afford them, low-power electro-decorative effects point the way here. The psychology of decoration is slowly widening in appreciation. A variation of colour "tone" here, a sudden contrast there, and so on, are easily obtainable by suitably disposed low-wattage tinted lamps, bowls, festoons, &c. True, at present they are luxuries, but with power price reduction, time will alter that. The subtle, but vital, influence of colour upon general health is being recognised, which, in itself, is almost sufficient. Already it is quite usual to dine in a room in which the colour scheme is peculiarly appropriate. No one would partake of a heavy meal in a drawing room. After the evening meal, to recline for an hour in a quiet colour atmosphere not only pleases, but indicates good psychological sense. A visitor to any electrical showroom, on a brilliant summer day, is, far from being disconcerted by the sunlight, deliberately, if sub-consciously, encouraged by discreet interblending of sunlight and coloured electric light.

Such a load, small in itself, but large in the aggregate, would, if judiciously used, effect a great improvement in load-factor conditions.

Finally, the diagram clearly shows that the peaks, exclusive of cooking, are the result of the summation of the small intermittent loads. This is to be expected as a result of convenience, and will be difficult, if not impossible, to eradicate. However, if in the aggregate they tend immediately to the cheapening of power (and it is confidently thought that they do), this in turn will be followed by a more general use of long-period loading, such as lighting, radiators, clothes-drying apparatus, towel rails, &c. When these become more universal, the intermittent non-cooking load peaks may be neglected.

The Trade Unions Bill.

Illegal Strikes; Picketing; and Political Funds.

By W. ERIC JACKSON, LL.B., Barrister-at-Law.

THE Trade Unions and Trade Disputes Bill may be expected—like most short Acts of Parliament—to provoke long and bitter discussion. The aim of the Bill appears to be to restore the strike weapon to its original position and function, namely, as a mode whereby employés may withdraw their labour pending a satisfactory settlement between themselves and their own employers. The Bill makes illegal all sympathetic strikes and strikes in trades in which there is not at the moment a trade dispute. The use of the strike as a political weapon, or as a direct road to social reforms in general, is forbidden. The necessity for such provisions in the Bill has, in the opinion of many, been apparent from the industrial events of the last few years.

During recent strikes the right of peaceful picketing or peaceful persuasion—conferred upon workers by the Trade Disputes Act of 1906—has more than once been disregarded or evaded in such a way as to nullify the protection given to non-strikers. Moreover, the refusal to strike has been visited with dismissal from the Union or other penalties imposed by the Union ordering the strike.

Sections 2 and 3 of the Bill are framed to remedy these matters as regards strikes which the Bill makes illegal. An "illegal strike" is one which has an object besides the furtherance of a trade dispute, and which is designed to coerce the Government or intimidate a substantial portion of the community. Hence a strike in an industry in which there is no trade dispute is illegal if it is meant as a political move to frighten the public. If it is not so meant (and it is difficult to see what sympathetic strikes will not be so designed) it is not "illegal," but it is unlawful in the sense described by Sir John Simon at the time of the last general strike—namely, dismissal from the Union cannot follow a failure to strike, and damages may be claimed by the employers against the Union calling the strike.

An "illegal" strike under the Bill must not be visited with penalties upon trade unionists who refuse to take part; they are to lose no benefits and may take any legal action against their Union to enforce their right to continue to be members and to receive benefits. The latter provision extends to all strikes *past and future*; hence any person expelled from a Union through failure to strike in May last will be able to claim reinstatement or damages.

It is to be illegal for anyone to contribute funds towards any "illegal" strike, and any person taking part in or supporting such a strike is visited with a fine not exceeding £10 or three months' imprisonment, which in special cases may be anything up to two years.

Under the Act of 1906 and the Emergency Powers Act, 1920, protection was given to persons who committed acts in furtherance of a trade dispute even though such acts might otherwise have been illegal. Such protection is taken away as regards "illegal" strikes.

Peaceful picketing is not prohibited by the Bill; but stricter provisions are made to ensure that picketing shall be peaceful in the proper sense. No intimidation of any kind is to be allowed. By intimidation is meant not only apprehension of physical violence, but fear of mental injury, boycott, or exposure to ridicule. Picketing is to be allowed so long as the number of persons engaged is not such that they obstruct or intimidate. By a special clause, watching and besetting any person's house is punishable with fines up to £20 or imprisonment up to three months.

As regards the political fund of a Union, the rule is to be "contracting in" and not "contracting out," as it now stands. Where a member contracts to contribute to the political fund, his fees are to be paid separately from his other subscription, and only the amount specifically subscribed to the political fund is to be used for political purposes. The rules of each trade union are required to be altered to conform to this provision.

Section 5 applies to permanent civil servants. They must not in future belong to a Union which is in any way given to political objects. But if a civil servant already is a member of a Union which is to give benefits on his death or disablement, he is not to be required to resign, provided he has been a member for the last six months. And civil servants who have work outside their

Government duties may belong to any Union dealing with such outside work.

Section 6 provides that public authorities must not force their employés to join or abstain from joining a Union. Hence a Labour Borough Council or a Conservative County Council can have no influence over employés either way. And non-union workers are not to be treated any differently from union workers.

Lastly, the Conspiracy Act of 1875 (which made it unlawful for a worker to break his contract of service so as to endanger life or property) is extended to cover breaches of contracts of service which will "prevent the discharge of the functions of the authority." Hence dustmen, tramdrivers, and gas workers will be unable to strike at all except under pain of fines or imprisonment.

It remains to be seen what success the Bill will meet with, and what alterations will be made in it as criticism is levelled at it. So far the opinion in Government circles as to its success is very optimistic, and one may feel confident that in some form or other the Bill will shortly become law.

The Ordinary Engineer and his Remuneration.

A review of the conditions which have resulted in the present low salaries for the bulk of the electrical engineers in this country.

By P. B. E.

THE correspondence which has recently appeared in the ELECTRICAL REVIEW inspired in me a desire to analyse the reasons for the meagre salaries paid to highly-trained electrical engineers.

In the first place, it is unfortunate, but none the less true, that the majority of skilled technicians, whilst possessed of practical knowledge and experience, are rarely men of great executive ability. There are those in the industry who are highly paid, some who are adequately paid, and a vast majority who receive salaries quite insignificant in comparison with their attainments, and with the work on which they are engaged. What are the broad divisions governing the classification? The first class comprises men with little technical training—or with none at all—who are possessed, or believed to be possessed, of outstanding business acumen. This class is composed of those who direct and manage our companies. Sometimes they possess their posts through merit, sometimes through pure cheek, and sometimes through unblushing influence exerted by someone higher up the tree. Whatever their deserts, such men are highly, even magnificently, paid. The second class, those who are adequately paid, consists of men of outstanding technical attainments; of men having ordinary technical attainments, and a knack of presenting them advantageously, and of men with exceptional personalities or influence. These two classes can be dismissed from our consideration. If dissatisfied with their remuneration, they can easily get it raised. The third class comprises probably 90 per cent. of the technical workers in the industry, and the question of their remuneration constitutes an extremely intricate problem. This class consists largely of men with University training and wide engineering experience; of men with the engineering instinct strong in their bones; and of men who, unable to afford a University education, have taken junior posts in engineering firms, and by dint of much private study and the help of evening classes, have eventually worked their way, after the expenditure of much time, to the engineering staff. There are others with no engineering instincts, no training, and no initiative, who slowly progress until their employers think that they can be employed on technical routine work and thus be used to dilute the engineering staff. With the last named we are not concerned, excepting to agree that their elimination would be highly desirable. The remainder of the class are usually hard-working and ill-used individuals. A few of the causes of their unjust treatment are enumerated below.

(1) The Britisher has a natural aptitude for engineering, and in consequence there is an inexhaustible supply of recruits, who, eager to get their feet on the first rung of the ladder, accept salaries far below what they ought. As they progress to positions increasing in importance, their salaries rise only at an insignificant rate, due to the low salaries of those coming along behind. This "negative" effect is naturally felt all along the line until the executive posts are reached. As the number of recruits far exceeds the expansion and wastage in the industry, it follows that stagnation—both as regards positions and salaries—is the result.

(2) Salary-fixing individuals are invariably well paid themselves. At all events, they have enough to live on. They forget their own experiences on the lower rungs of the ladder—or if they remember them at all, they do so in terms of pre-war salaries. They think, in effect, "Oh, well, 'X' ought to be satisfied with £350 per annum. At his age I was only getting £400, and he *can't* be as clever as I was." What Salary Fixer, Esq., forgets is that Mr. Jones's £350 to-day is equivalent to only about £220 pre-war—a most disgraceful salary to offer to any man with any pretensions to technical ability.

(3) There is no society in existence whose main object it is to secure adequate remuneration for electrical engineers. The Institution of Electrical Engineers holds itself placidly aloof. The National Union of Scientific Workers certainly includes remuneration as one of its objectives, but fails to exercise any pressure in that direction except in one or two isolated instances. Its very existence is unknown to most engineers, and its recently-issued appeal will fail in its object, since it gives no hopes of the salary question being seriously attacked.

So far as I am aware, the Society of Technical Engineers does not claim to deal directly with this question. Its declared object is to raise the status of the engineer, believing that this method of indirect attack will lead to the desired result. It is self-evident that the engineer's status does require protection and elevation, but as a means of effecting an improvement in salaries, this method is altogether too slow. Swift action is essential if thousands are to be saved from penury.

Moreover, no society will obtain effective support until it is prepared to take swift action.

(3) The inherent nature of the engineer, who generally is modest and retiring and is possessed of a modicum of proper pride. The mere asking for an increase in salary is repugnant to him, and the idea of exerting pressure, nauseating. He takes pride in his work for its own sake, consequently the quality of his work is independent of the inadequacy of his salary.

(4) Specialisation, which, it appears, is generally regarded as an asset. Perhaps to some extent it is, but it has its drawbacks—and very serious ones they sometimes prove to be. For instance, a man may have spent several years on large machine design, but he will find the utmost difficulty in obtaining a post in any other branch of design unless he can—and will—lie scientifically and convincingly.

(5) The fact that the engineering concerns of the country are scattered over a large number of localities is a serious contributory cause of low salaries. The engineer of to-day is a specialised unit. Those firms which can employ his knowledge and experience may be located, broadly speaking, anywhere between London and Glasgow. It is a serious matter for a man with a family, and no financial reserves, to uproot his home and start afresh in a new town. He may find considerable difficulty in disposing of his house without financial loss, and in procuring another. The costs connected with his removal may, in fact, neutralise for a number of years the increased salary attached to his new post. Employers are well aware of this fact, of which they take full and unfair advantage.

(6) The collaboration which exists between firms engaged on the same class of work. Although it is vigorously denied, it is a fact that certain firms will not engage a man unless his present employers are prepared to release him.

These are a few of the reasons why the ordinary engineer receives a salary on which he can barely exist, let alone educate his childen. The remedy can be summarisd in one word—education—and elucidated in very few more. The full power of the Press, both technical and public, must be enlisted. The coming generation must be shown the true position: that hoary fable of the many "plums" waiting for suitable men must be ruthlessly exploded; young engineers must be taught that the acceptance of salaries so low as to deserve the appellation "nominal," will affect not only the whole of their own careers, but those of the whole profession. Employers must be educated. They are more in need of that than are most of their employés. If they will not accept education, it must be forcibly thrust upon them. The Americans have found that high production follows high remuneration. It is time our employers were asked to experiment in the same direction. They can begin by paying fair salaries to their engineering staffs. Whereas one engineer is but a unit, the whole body, when united, could bring the employers into line with a relentless jerk in the course of a few weeks. The use of force, or forcible methods, is to be greatly deprecated, and should only be used when employers persistently refuse to act justly, after having been shown that the salaries they pay are unjust. The query arises whether employers are not, even now, fully aware of the inadequacy of the remuneration of their technical staffs. There are many who believe that they are; what employers probably do not know is that, beneath a placid surface, the whole technical side of the industry is seething with unrest. It would be well, as a starting point, if the Institution of Electrical Engineers could be galvanised into educating the multitude of employers in its own ranks. Of course the idea of that august body being galvanised by anything short of an earthquake strikes one as ludicrous, but, after all, though the awakening might be a matter of great difficulty, it is by no means impossible. Education must also be carried to shareholders, so that they may realise that the concerns they own are dealing most unjustly with one branch of the employés. The public also must be shown that it is both wrong, and uneconomical, to starve that section of the community on which the prosperity, and indeed the very existence, of the country so largely depends.

It is only from continuous, active, and public pressure that any beneficial results can be expected. When engineers realise their power as a body, they will find means of forming an organisation to protect their interests and be under their control. On that day the injustices to which we are now subjected will be on the way to being rectified.

Electric Water Heating.

A consideration of the possibilities of load-factor improvement in connection with the electrical thermal storage of water with time control by motor-meter switches.

By J. W. MEARES, C.I.E., M.Inst.C.E., M.I.E.E.

In the Electrical Review of March 4th, Mr. E. E. Sharp expressed the view that time-controlled water-heating will eventually help to fill up the hollows in our load curves—a possibility that the present writer has been putting forward for years without much effect. It has been done successfully at Simla, in India, even without time-switches, by voluntary co-operation between the supplier and consumer; but that is too much to expect here, so that it comes down to the bed-rock cost of the *additional* units generated and the cost of the time-switch. So long as clock-controlled time switches are essential their cost will be a serious obstacle to progress, though of course any great extension of their use would cheapen them.

Any one who has been much about the world knows that we British, whether rightly or wrongly, are universally debited with the characteristic of waiting till the other fellow has done it before taking action ourselves. At present, if the politicians are right, we are entering upon a new golden era of "cheaper and more abundant electricity," and we all hope they *are* right, whether we agree with their panacea or not.

Now when all has been said about grids and standard frequencies and super-stations, the plain fact remains that in improved load-factor lies the only real prospect of cheapening supply; because the additional output spreads the standing charges without increasing them, while only enhancing the running costs fractionally. (Our present-day central station load factors average about 20 per cent. only).

This has long been recognised, and many tariffs are specially devised to benefit the most useful class of

consumer; but the correspondence in the lay Press from our masters, the public, which knows nothing of load factors, but pays for the supply, shows that there is much high feeling about the discrepancies in the ultimate cost of a unit in adjoining areas. The grievance is a real one, an *argumentum ad pocketum*, which no amount of perfectly correct technical explanation will in any way allay.

Of late years the more progressive undertakers have been busy improving their heating and cooking loads by means of special tariffs, and at the same time improving their load-factors and reducing their total costs per unit generated. It is perhaps not always fully realised that if the public responded, and really boomed these special supplies, they would soon become predominant and swamp all other uses; in which case higher, rather than lower, rates would have to be charged in order to redress the balance. An oft-quoted example, in a "Report on the Heating of Houses" by the Hydro-Electric Commission of Ontario, shows that if the 80,000 houses in Toronto alone were electrically heated this would require eight times as much power as the present total demand of that City; so that heating would have to bear the whole cost and provide all the profit, leaving other uses of power as the by-products.

Up till now domestic water-heating, except in a few places supplied by water-power, has been considered prohibitive in cost; and, if it were not so, the Ontario objection would still apply if it became universal. Economic conditions, however, make it certain that there is no immediate danger—or shall we say prospect—of any inordinate run on our stations for any form of heating. Therefore, the more such loads are developed as paying loads, or even as overhead-cost-spreading loads, the better.

Now the diversity factor of cooking loads is generally bad, and that of house-warming loads indifferent; the peak times of the former necessarily coincide as a rule, and the demand for heat varies with the climate and so is fairly uniform in any one area. And when power is wanted for these purposes it must be available; no one will alter his hour of breakfast or dinner, or sit in cold storage, in order to improve the load factor of one undertaker (and perhaps the business of another) and to obtain a slight reduction in the tariff.

With water heating it is different. Hot water must, it is true, always be available, but with properly lagged tanks it can be kept hot for hours with the power cut off—and, unlike a chop, with little deterioration. Whereas electric cooking and house warming require the full power (or nearly so) to be in use during the whole period of operation, and no power at other times, it is otherwise with water heating. Here, with properly designed thermal storage, there can be a uniform consumption of power throughout most of the 24 hours, regardless of the time at which hot water is actually drawn off. This is, or could be made, an immense advantage to the suppliers, as the amount of plant—and capital—per kWh sold for the purpose becomes the minimum.

In order to obtain the full advantage power must *not* be used throughout the whole 24 hours; it must be cut off at times of peak load. If the morning peak is much smaller than the ordinary evening peak, the latter alone need be considered; if there are two or more comparable peaks, all must come into the reckoning. Now it is abundantly clear that the consumer cannot be induced or trained to cut off the water-heating apparatus before the peak and to restore it afterwards, so if it is to be done at all it must be done automatically. The advantages of so doing it, both to undertaker and consumer, are incalculable; and considerable capital expenditure would be justified in supplying a reliable time-switch in each installation. Practical examples are always useful in these cases. Let us assume a small house requiring 110 gals. a day at 100 deg. Fahr. and it will be found that with modern apparatus this requires some 5,500 kWh per annum. If a time switch costing 60s. were employed, 15 per cent. on its cost would amount to 0.02d. per kWh; and, as the prime cost would be fairly independent of the consumption, this figure would be far less in large houses. The gain to the undertakers in additional output without increased maximum demand would clearly be far more than this sum, and they could install the apparatus free of vexatious rent charges; but we are not progressive in such matters.

It may be assumed that a charge of a halfpenny a unit *over all*, coming to nearly £12 per annum for 5,500 kWh, would be near, if not beyond, the limit obtainable from a small householder; and at present there are not too many stations in which the cost of fuel alone is less than this, though it would be less for *additional* units taken by themselves. Still, we must look forward to better times, while reckoning that from both the average supplier's and the average consumer's points of view a halfpenny may prove practicable.

But is it necessary that a time-switch costing even as much as 60s. should be required? Some years ago, in a case where an immediate and assured market existed, the present writer addressed several leading manufacturers suggesting that a cheap and efficient time-switch could be evolved on the basic lines of an ordinary motor-meter, which at the pre-arranged time would operate a relay to open and close the circuit; he was told that it could not be done. The difficulty is said to lie in the fact that the best of these meters are bad timekeepers, and that only a clock is effective. The permissible error of motor meters, as laid down by the B.E.S.A., is 2 per cent. either way at from one-fifth to full load; that would be half an hour a day, and no such error is allowable. But over so wide a range there is necessarily a large departure from straight-line accuracy; and under service conditions, for which the B.E.S.A. caters, the meter is stationary and cold for hours in the night, and varying its load and temperature without cessation at other times. Surely if the motor were designed for *constant operation at one load only*, across the supply mains, the rate of rotation would necessarily be practically uniform? (The slight changes in the supply voltage would average out in the course of a day). At any rate, has any maker ever tried this out? The writer can find no evidence that any one has put out a fiver-sprat in definite research for a way of catching this million-whale.

As matters now stand such a motor time-switch could be reset once a quarter, at the time of meter reading; an error of ¾ hour in that time could be compensated for by adding it to the switched-off period, for it would be definitely either a gaining or a losing error, and not an erratic one. This would involve an inaccuracy not exceeding one-tenth of one per cent. in the rate. Perhaps that is too much to expect. But the time of peak load also varies with the seasons, so that even with a clock-switch it would be necessary to reset the gear from time to time. It would seem as though, in order to improve the load factor by a matter of 20 to perhaps 40 per cent. it would be worth while to have all the time switches set by hand once a month, or even once a week; large interests are at stake when a single small house may be worth 5,000 extra units. Clearly, when starting the system each individual switch would have to be adjusted to the mean pressure conditions of its locality; but that is merely a matter of changing a wheel in the gear train after a week's trial.

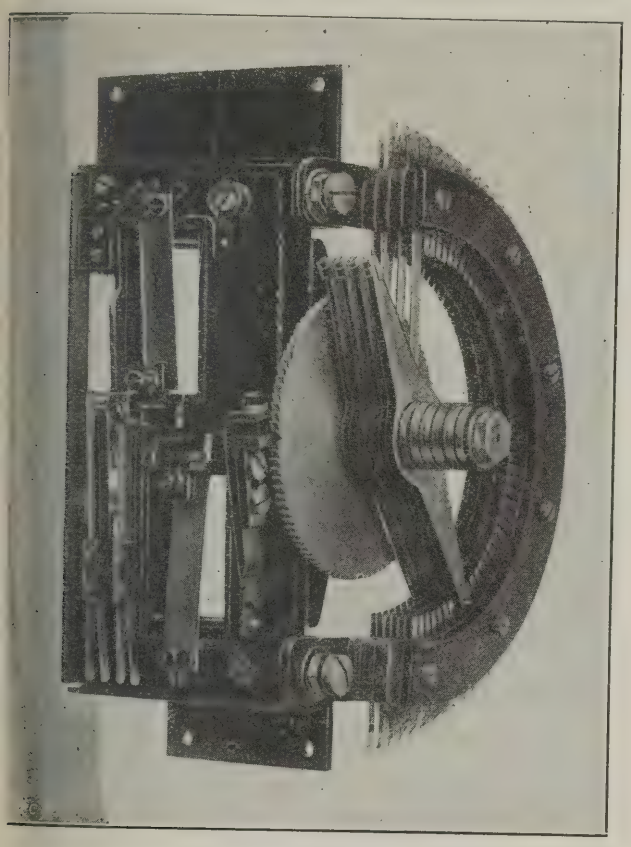
The Electrical Development Association and kindred bodies might think over all this with advantage, for a fraction of the money and brain power spent on boosting electric cooking would probably show a far greater eventual return.

[The Warren synchronous motor—a simple little device, which is widely used in the United States for driving electric clocks—could perhaps be used to close a switch at, say, 9 p.m. and open it at 5 a.m., on a.c. circuits, all the year round, without attention (see Electrical Review, February 18th, 1927, p. 276).—Eds.]

An Automatic Telephone Switch.

A quick-acting switch which can be manufactured on a large scale very cheaply: it can be constructed and arranged in a very simple manner to act as a line-finder, call-distributor with many outlets, group selector, or final-selector.

ALTHOUGH the Strowger switch is used extensively in telephone exchanges, there are others which differ considerably from that pattern, in that they are power-driven. Many rotary switches are thoroughly efficient in comparison with the Strowger type; nevertheless, they cannot be employed in the simplest manner as line-finders, call-distributors, group-selectors, and final-selectors, as desired. For example, if connected as line-finders in installations whereof the groups contain 100 subscribers each, then, in the case of most of them, several switches must be arranged in parallel with one another for each junction; and, if the switches have a 50-point contact bank, the contact arms must also be crossed, the calling line is to be connected through quickly. Those switches that have 100-point (and larger) contact banks often need a long time to reach a calling line; a "quick-acting" switch is capable of testing with certainty at least 100 individual lines in succession in less than 0.5 second.



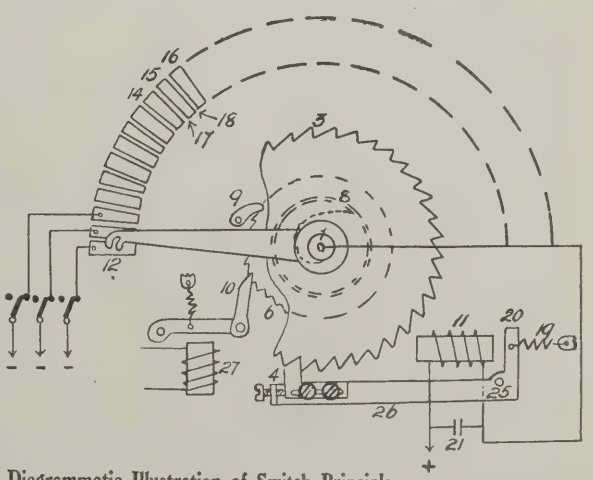


Fig. 1.—Quick-acting Telephone Switch.

That simplification of apparatus should be aimed at, especially by devising a less complicated and more efficient type of switch, has always been recognised, and in this connection our attention has been drawn by Dictograph Telephones, Ltd., to a quick-acting switch (fig. 1), the principle of which is indicated by figs. 2 and 3. It has a spindle 1 on which the brushes are mounted, insulated, only one brush being shown; a sleeve 5 is rotatably mounted on the spindle, which carries at its upper end a ratchet wheel 6 and at its lower end a spring box 7; one end of the spring 8 is connected with the spindle and the other end with the casting of 7, so that when the spring-box is rotated in the direction of the arrow the spring 8 tends also to rotate the brush spindle in the same direction. The consequent winding up of the spring is effected by a propelling pawl 9 oscillated by an electromagnet 27, the pawl rotating step-by-step the ratchet wheel 6 attached to the spring-box until the spring 8 is completely tensioned. Rotation of the wheel 6 in the reverse direction is prevented by a locking pawl 9; the brush spindle 1 is held against the action of the spring 8 by stopping pawl 4, which engages in the teeth of a wheel 3 secured on the spindle.

In order to set the brushes 12 on any bank contact the stopping pawl is moved out of the wheel 3 by the control magnet 11, and so soon as the brush leaves the bank contact lying in front of the desired bank contact the magnet is de-energised so that the pawl 4 again engages the wheel 3 and stops it. The current passing through the magnet flows through the brush 12 and the bank contacts wiped over by it; all the bank contacts up to that one (for example, 15) whereon the brushes are to stop are connected with the battery, and the adjustment of 12 in relation to the bank contacts and of 4 (which is movable on the armature lever 26) in relation to the teeth of 3, is such that the point of the pawl at the moment when the brush just leaves bank contact 14 (lying in front of the desired bank contact 15) stands in front of the tip of a tooth of the stopping wheel 3; thus the total time which the brush needs to wipe over the desired bank contact 15 and the air gap 17 separating it from the adjacent bank contact 14, is obtained for the dropping of the stopping pawl 4 into the correct tooth slot; the time of dropping of the pawl 4 can be adjusted by regulating the tension of the armature return spring 19. An important means for the shortening of the time of falling of the armature 20 (*i.e.*, for the rapid engagement of the stopping pawl 4 in the correct tooth slot) is the condenser 21, which reacts on the magnet coil 11 and can be connected in parallel with the coil 11 or the brush 12; by this means the current in 11 on opening its circuit is not only made to decrease quickly, but also up to a certain degree to reverse its direction, the residual magnetism of the control-magnet core being obliterated. It has been found in practice that the switch stops its brushes, or catches with sufficient operating certainty, when the brushes wipe over their bank contacts at a speed of 300 contacts per second: a 100-point line-finder of this construction, therefore, reaches the 100th bank contact furthest removed from the position of rest of the brush in one-third of a second, so that the use of a dialling tone (which indicates to a calling subscriber that his line is connected through to the next selector, and that consequently he can operate his dial) can be dispensed with.

When working as a line-finder for subscriber groups up to 50 lines, two groups of brushes displaced by 180 deg. are used, of which each reaches the beginning of the row of bank contacts before the other group of brushes leaves the last bank contact of the same row. In groups of 100 lines the groups of brushes are also displaced by 180 deg., but are so displaced that when the one group of brushes has wiped over 50 contacts, the other group wipes over a further row of 50 contacts.

Figs. 2 and 3.—Diagrammatic Illustration of Switch Principle.

When working as a group selector, the contacts are divided into groups; at the beginning and centre of each arc embracing a group are located controlling bank contacts, and between each such pair is a third long intermediate contact, which

may be composed of several ordinary bank contacts connected with one another. In each arc are located the bank contact sets for the junction lines leading to the next group selectors, or the connectors: the dimensions of each arc jumped over by the brushes can be selected within limits merely by connecting, as initial and central contacts, such bank contacts whose distance from one another is greater or less. The possibility is thus obtained of making the number of junction lines in the different trunks proceeding from the group selector different, without leaving bank contacts unoccupied.

When arranged as a final selector or connector, the long or "ten" steps of the brushes are determined by an inner row of bank contacts which is wiped over by a brush, whilst the short or "unit" steps are determined by outer bank contacts wiped over by another brush. The long steps may, as in the case of the group selector, be of different lengths, that is to say, any one may correspond with a bank contact arc which contains 10 or more lines; this is very valuable for multiple connections.

It is declared that the selector will last for at least 20 years in a busy exchange. The soldering tags of its contact bank are so formed that the contact banks can be multiply connected by straight wires or cable bands. In the group and final selecting stages it is contended that about 20 per cent. of the present selector cost can be saved by using the new quick-acting switch, which enables a subscriber, after taking down his receiver, to operate his selector immediately, and makes it unnecessary for him to first wait for a signal. A new starting circuit is employed, and is so arranged that several subscribers calling at the same time can be connected through simultaneously. The new switch also makes economies possible in the pre-selecting stage: the number of line-finders employed in the first pre-selecting stage can be reduced, and, in comparison with the 100-point line-finders hitherto known, it is not only quicker, but also cheaper. Without splitting the multiple, over-lapping, or staggering the multiple connections on the contact banks which make inspection difficult, calls can be distributed perfectly uniformly on group selectors, which may be as large as desired, so that the greatest utilisation of all switches can be readily obtained.

The switch described, the invention of Mr. Fritz Aldendorff, has already been incorporated in several private automatic branch exchanges placed on the market by Messrs. Dictograph Telephones, Ltd.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

An E.D.A. Film Display.

The British Electrical Development Association proposes to run a display of E.D.A., British and American kinematograph films at Australia House on May 3rd. About 200 seats will be reserved for members of the Electrical Association for Women, the remainder being available for persons engaged in the electrical industry.

The Department of Overseas Trade.

The proposed "termination of the separate existence" of the Department of Overseas Trade has called forth protests from many quarters. Col. F. V. Willey, ex-president of the F.B.I., characterised the proposal as a "grave mistake," and expressed the hope that there would be no curtailment of the activities carried on by the Department, and also that the Foreign Office would not be allowed to interfere with the work, which, he said, it had never regarded with a sympathetic eye. Sir Stanley Machin, ex-president of the Association of British Chambers of Commerce, said that the Department was a live and useful body of great value to exporters, and nothing should be done to impair its efficiency. Mr. H. T. Humphries, general secretary of the Incorporated Society of British Advertisers, stated that the Department provided a constant stream of information called for by the members of the Society, and suggested that it might be made a trading department charging for its services like the Post Office. Mr. Churchill himself admitted that the transfer of work to other departments would not in itself effect any large saving; the extent to which functions could be discontinued would be examined in detail when the necessary legislation was presented to Parliament.

Lord Sandon, M.P., according to *The Times*, put down a motion in defence of the Overseas Trade Department in the following terms:—That this House regards with alarm the Government's intention to discontinue the separate existence of the Department of Overseas Trade, in that, while involving a negligible, if any, apparent saving in expense, it will not prove an economy, but is bound to create a loss of revenue to the State, due to the lack of prosperity in industry, resulting from the loss of new markets and trading openings such as are constantly being discovered under the auspices of the Department; and that the House believes this to be owing to the Department's unique atmosphere of vitality, enterprise, and helpfulness, attributes which of necessity and in fact cannot be found in any other department, and which would certainly be lost if it were placed under one of the older departments, a fact fully appreciated by all sections of industry in this country, for the benefit of which its submergence is urged.

Local Exhibition.

Stepney.—An electrical exhibition is to be held at the People's Palace, Mile End Road, E., from April 29th to May 7th. Messrs. Wingrove & Rogers, Ltd., intend to exhibit a "Midget Whippet" electric battery truck. This truck has a carrying capacity of half a ton, and the particular model to be shown is fitted with an elevating platform operated by hand mechanism, but it is also supplied with a plain platform. This type of truck is made to carry up to 2½ tons. The truck will be demonstrated during the exhibition.

Telephone Development.

A further publication has reached us from the Controller of the London Telephone Service extolling the advantages of the telephone as "The Speediest Way of Doing Business." Particulars of trunk call charges are given, notably the fees for regular daily use. On the back of the pamphlet the use of extensions is advocated; the daily cost is small and installation is free.

An Economic Survey.

Among the documents prepared for presentation at the International Economic Conference which is to be held at Geneva in May, is a "Summary Memorandum on Various Industries." This is a study of the principal industries of the leading industrial nations and in a broad way links up with the B.E.A.M.A. survey which is reviewed elsewhere in this issue. It differs, however, by reason of its wider scope and more general nature. It is interesting to note that many of the main conclusions arrived at agree with those of the B.E.A.M.A. report.

Lighting in Schools.

Realising the importance of adequate and correct lighting in schools, the Cardiff Corporation is at present engaged in re-fitting the schools in its charge with up-to-date lighting equipment. Mr. C. G. Morley New, the city electrical engineer, is acting as consultant and the work is being done by local contractors to his specification. Thirteen schools have already been dealt with and seven of these have been equipped wholly with B.T.-H. "Veluria" shades, three with "Holophane" shades, and three with mixed types of reflectors in conjunction with obscured gasfilled 60-W and 100-W lamps. The "Veluria" shades have an excellent appearance, both by day and by night.

Indian Electrical Imports.

The imports of electrical equipment into India during January last attained a value of 4,300,000 rupees, as compared with only 1,627,000 rupees in the first month of 1926.

Engineering Employés' Wages.

On April 12th a conference of representatives of the engineering trade unions and of the engineering employers was held in London. Mr. J. T. Brownlie, president of the Amalgamated Engineering Union, presented a request that the employers would again consider the question of an advance in wages in the light of the improvement which had occurred in the position of the industry since the unions decided to postpone further action in the matter last August. Mr. Brownlie reviewed the course of the previous negotiations and then mentioned specific examples of the increased business which the industry had recently secured. He pointed out that his union's records showed that the percentage of members who were unemployed had fallen from 12.80 in December to 8.06 at the end of March. The wages of skilled engineering workers, he said, were totally inadequate and compared very badly with those paid in other industries. That fact was driving skilled men from the country and preventing boys from entering the industry. Sir Allan Smith, in expressing his appreciation of the way in which Mr. Brownlie had presented his case, promised that the question would receive the earnest consideration of his federation. In accordance with its rules, the district associations would first have to be consulted. It was decided to resume the conference on May 19th.

Hopkinson's Display at Blackpool.

Engineers notoriously can never get away from "the job," even when on holiday, and this propensity is catered for, so far as northern engineers are concerned, by Messrs. Hopkinsons, Ltd., of Huddersfield. They have again opened their display at Blackpool for the season, and a view of this

Engineering Exhibits at Blackpool.

s reproduced herewith. The display is purely an exhibition f the company's latest products and not a sales office. A omplete range of safety boiler mountings and valves for the ighest pressures and superheats is on view, and most of the xhibits are in section to enable a complete examination to e made.

The Timber Market.

Our timber trade correspondent writes that during the past nonth the market for softwood timber for house, packing-ase, and general construction work has shown a firmer tendency, after easier times, owing to the good consumption, aving stocks comparatively light. The opening of navigation n Northern Europe next month, however, will release very rge quantities for immediate shipment, but as these have een purchased at higher rates than winter supplies, the arket is expected to continue firm. Hardwoods of American escriptions keep in good supply, owing to increased shipents, but forward business remains firm, and spot conmption is increasing. For mahogany and other hard and ncy woods in the log, stocks in first hands are light, and rates rm for all descriptions. With the general increase in housebuilding and other industries the timber trade appears to e in for a very busy time, hence sellers will have the market little more in their favour than for some months past.

The Italian Radio Market.

The United States Consul at Milan says that a good market isted for crystal sets immediately after the opening of the ilan broadcasting station in 1925, but the demand fell to considerable proportions. Now it is proposed to erect a ew station near Milan, and this is expected to open up a ew and larger market. A great deal of interest has been own in valve sets; the cheapest are of Italian make, but erman, British, French, and American sets are available.

Australian Electrical Imports.

The imports of electrical machinery into Australia during nnary last attained a value of £589,000, as compared with 577,000 in the corresponding month of 1926.

New Italian Companies.

Among the concerns recently formed in connection with electricity supply in Italy are the Società Elettrica Buonalbergo-Casalbore, formed at Buonalbergo with a capital of 300,000 lire; La Società Idroelettrica Val d'Argri di Missanello, of Missannello (Potenza), capital 100,000 lire; La Società Elettrica di Maccarese, Rome, capital 20,000 lire; La Società Elettrica Val Breggia, Milan, capital 55,000 lire; La Consorzio Distribuzioni Elettriche "CDE," Genoa, capital 5,000,000 lire; and La Società Distribuzioni Elettriche Liguri, Genoa, capital 100,000 lire.

Catalogues and Lists.

Ateliers de Constructions Electriques de Charleroi, 56, Victoria Street, S.W.1.—April stock list of motors and dynamos.

The B.E.N. Patents, Ltd., 96-98, Victoria Street, S.W.1.—An illustrated and priced pamphlet dealing with a universal saw and sanding machine.

Electradix Radios, 218, Upper Thames Street, E.C.4.—An illustrated catalogue of radio apparatus, electric drills, heaters, &c.

Philips Lamps, Ltd., 145, Charing Cross Road, W.C.2.—Leaflet No. 81, illustrating and describing the company's h.t. supply unit for connection to d.c. mains. Priced.

The Midland Electric Manufacturing Co., Ltd., Barford Street, Birmingham.—A leaflet announcing reduced prices of "Memette" switches.

The Benjamin Electric, Ltd., Brantwood Works, Tottenham, N.17.—The "Benjamin Reflector" for March-April, containing illustrated articles on industrial lighting, &c. Also a folder, "The Boyce Moto-Meter Vindicated," containing a *résumé* of the proceedings in a recent patent infringement action.

Messrs. S. G. Brown, Ltd., North Acton.—The "Brown Budget" for April, containing notes and news relating to the company's loud speakers, telephones, &c.

Messrs. Warren Bros. (Middlesbrough), Ltd., Electric House, Grange Road West, Middlesbrough.—An illustrated pamphlet dealing with a moisture separator for steam installations.

Superlamp, Ltd., 92 & 94, Paul Street, E.C.2.—April net trade price list of electrical material, accessories and appliances. Illustrated.

The Consolidated Pneumatic Tool Co., Ltd., 170, Piccadilly, W.1.—A catalogue of "Boyer" pneumatic tools.

The Marconiphone Co., Ltd., 210-212, Tottenham Court Road, W.1.—A coloured showcard illustrating the construction of the Marconi "D.E.P.215" valve. Priced. Also a coloured poster depicting the company's 410 series of valves, with prices, and a folder dealing with these.

Trade Announcements.

Messrs. L. Apple, Ltd., 13, Brewer Street, W.1, and 79a, Tottenham Court Road, W.1, state that they have no connection with any firm trading under a similar name.

Messrs. Buglass & Jamieson, Ltd., Dundee, state that Mr. J. F. Buglass, formerly a director and latterly a manager, has now left their employment. Mr. T. C. Donald, Stirling, has been appointed director in place of Mr. Buglass, and Mr. W. E. Jamieson has been appointed managing director.

The British B.A.G., Ltd., has removed its head office and stores from Manchester to 23, Farringdon Avenue, E.C.4. The sales organisation will in future be conducted from London under the management of Mr. H. W. Dauncey.

Messrs. R. Stirling & Co. have recently removed from 85, Douglas Street, to 167, Holm Street, Glasgow. The telephone number is unaltered.

Mr. C. P. Abraham, wireless engineer, has opened new premises at 32, Castle Street, Hastings.

Messrs. G. Dikkers & Co. (England), Ltd., have been appointed sole agents in the British Isles for Messrs. Willem Smit & Co., Ltd., and have moved to new premises at Avenue Chambers, Southampton Row, W.C.1 (Telephone: Holborn 3100; telegrams: "Dickavalve, Westcent, London.").

The New Italian Art Association, Ltd., has moved to larger premises at 57-58, Wells Street, W.1. Telephone: Museum 0383.

Messrs. Ward & Goldstone, Ltd., have purchased the plant, machinery, and goodwill of the Knivetown Electric Wire Co., late of Ponders End, and they are now able to supply all the specialities previously manufactured by that company.

Coventry Electrical Accessories, Ltd., has appointed Messrs. Harwell, Ltd., 28, John Street, Theobald's Road, W.C.1, as selling agents for its appliances.

Bankruptcy Proceedings.

O. Walker, trading as the Albion Electric Co., Albion Street, Wallasey.—The public examination of this debtor was held at the Birkenhead Bankruptcy Court on April 6th. The liabilities were stated to be £1,056 and the assets £54. Debtor stated that he commenced business in April, 1923, with £50 borrowed from his mother. The business was successful for two years, but then negotiations for a partnership fell through, and he borrowed further sums from relatives. During the first two years the turnover was about £3,000 and the profit between £150 and £200. He admitted that the loss of £1,000 had occurred during the last year, and said that he had kept no books or accounts of receipts and pay-

ments. The Registrar censured the debtor, stating that he was not satisfied with his statements, and adjourned the examination *sine die*.

P. J. White, 5, Dyer's Buildings, Holborn, merchant, trading as P. J. White & Co.—The first meeting of creditors was held on April 7th, at the London Bankruptcy Court, when accounts were presented showing liabilities of £5,849 and assets consisting of office furniture £40, and a bad debt £821. The Official Receiver reported that the debtor had been connected with various electrical companies. He was a director of the Anglo-Colonial Engineering Co., Ltd., which was registered in March, 1914, to carry on business as electrical and general engineers, and to which he introduced various agencies. In 1915 the company went into liquidation. The debtor continued business, and in August, 1919, formed P. J. White & Co., Ltd. He attributes his failure to inability to recover £820 from the Radio Equipment Co., Ltd., which went into liquidation in 1926; also to general trade depression. The case was left in the hands of the Official Receiver.

J. D. Chisholm, 34, Gordon Square, W.C.—This debtor came before Mr. Registrar Warmington at the London Bankruptcy Court on April 13th for his adjourned public examination. He formerly carried on an agency at Leeds for a London firm of electrical engineers, and in October, 1924, formed a company to which he transferred his various radio and electrical inventions. A receiving order was made against him in October, 1925, when he returned liabilities of £976, against assets valued at £4,154. Mr. Waterer, Official Receiver, reported that the debtor recently obtained an order to rescind the receiving order on the ground that all the debts had been paid in full. It transpired later that certain debts had not been included, whereupon the rescinding order was cancelled and the debtor was directed to amend the statement of his affairs and attend at the Court for further public examination. The debtor was not in attendance, and his examination was adjourned *sine die*.

A. H. Hughes, Eckington Road, Coal Aston, Derbyshire, wireless and electrical merchant.—The public examination of this debtor was held on April 8th, at the County Court, Chesterfield. According to the statement of affairs there was a deficiency of £2,836. Debtor said that he had suffered losses through ill-health, and he attributed his failure to lack of capital and loss of commission on over £30,000 worth of orders which had to be cancelled on account of his health. The examination was adjourned.

V. Reed, electrical engineer, 10, Chapel Road, Eastville, Bristol.—Trustee, Mr. F. W. Darley, Official Receiver, 26, Baldwin Street, Bristol, released April 4th.

J. Benson, electrical engineer, late of 2a, Wade Street, Leeds.—Trustee, Mr. H. C. Bowling, Official Receiver, 24, Lower Bond Street, Leeds, released April 1st.

E. Cowley (trading in co-partnership with G. Hill and G. Noble as G. Hill & Co.), electrical engineer, 22, Chantry Lane, Great Grimsby. Discharge suspended for 12 months.

A. T. K. Moir (Moir & Watts), electrical and mechanical engineer, Weardale Road, Lee, Kent.—Trustee, Mr. E. H. Hawkins, 4, Charterhouse Square, E.C., released March 24th.

J. R. Barker, wireless dealer, Tanshelf House, Front Street, Pontefract, and 183, Kirkgate, Wakefield.—Trustee, Mr. B. S. Briggs, Official Receiver, 21, King Street, Wakefield, released April 5th.

Company Liquidations.

Kingsway Radio, Ltd., radio and electrical dealers, 92, Cannon Street, E.C.4.—A meeting of creditors was held on April 12th, at the Institute of Chartered Accountants, E.C. The chair was occupied by Mr. W. Cranstoun Todd, C.A., 3, Cannon Street, E.C., the liquidator in the voluntary liquidation of the company. The statement of affairs presented showed ranking liabilities of £1,044, and the assets were estimated to realise £428 net, leaving a deficiency so far as the creditors were concerned of £616. As regarded the shareholders, there was a deficiency of £2,894. The business was originally carried on by Mr. H. L. Percy, and the company was registered on October 2nd, 1925, the nominal capital being £3,000, in £1 shares. The shareholders were: Mr. Percy, 400 shares, Mr. W. J. Mather, 650 shares, Mr. Butler, 500 shares, and Miss Sutherland, 300 shares. The purchase price for the business was £1,007, which was discharged by the allotment to the vendor of 1,000 shares and the payment of the balance in cash. The remaining shares were issued for cash. A balance sheet prepared at the end of the first year's trading showed sales of £2,840, with a net loss of £570. There had been a slump in the wireless business, and the trading of the company had been considerably affected. If the stock was forcibly realised at auction there would probably be very little for the creditors. The liquidator was therefore continuing the business for the time being in order to dispose of the stock at reduced prices. It was not possible to sell the business as a going concern. The business could not stand the heavy expenses with which it had been faced. Mr. Percy had lectured on wireless in the City, and it had been hoped that the connection of the company would be largely increased. A resolution was passed confirming the voluntary liquidation of the company with Mr. Todd as liquidator. The following are creditors:—

	£		£
Dickinson, C. B., Ltd....	182	Ever Ready Co., Ltd. ...	38
Burndept Wireless, Ltd.	42	Edison Swan Electric Co., Ltd.	22
General Electric Co., Ltd.	44	Ericsson Telephones, Ltd.	45
S.T., Ltd.	33	Browning, H. S. ...	37
Pathé of France, Ltd. ...	34		

Foolproof Patent Accumulator Co., Ltd.—The joint liquidators in the voluntary liquidation have issued a statement as at March 25th, the date of the winding-up resolution, showing ranking liabilities of £3,044 and assets estimated to produce £1,028, leaving a deficiency of £2,016. The issued capital is £1,000, making the deficiency, so far as the shareholders are concerned, £3,016. A trading account shows a net loss of £1,942, and the balance of the deficiency is attributed to the writing down of machinery, plant, &c. A meeting of creditors was held at Market Harborough on April 11th. The statement of affairs and trading account were explained by Mr. John S Bullivant for the liquidators. Mr. Bullivant said that the company was incorporated in October, 1925, to carry on a business commenced by Mr. Judd in Market Harborough. Mr Millington, Senr., provided the capital of £1,000, shares being allotted: 900 to Mr. Millington, Senr., 50 to Mr. Millington Junr., and 50 to Mr. Judd, the Messrs. Millington leaving the conduct of the business practically entirely in the hands of Mr. Judd. Nothing at all was done in the way of production or experimental work until February, 1926; from that date until August, two hands were employed in addition to Mr Judd. No sales appeared in the books until August. From August until the date of winding up of the company, the personnel was increased and the average weekly wage paid was between £30 and £40; the whole of the output of the factory was manufactured during that period. The records of the transactions were very incomplete. Mr. Millington, Senr., had advanced £591 for payment of the company's debts. The deficiency was attributed to wages, materials, and sundries expended in experimental work, &c., useless advertising, difference between cost price and estimated realisation price of plant and stock, non-productive expenses, patents, &c., and trading loss. The liquidators were in touch with five applicants to purchase part or whole of the assets, and it was hoped to find a purchaser who would take over the whole of the assets.

Radi-Arc Electrical Co., Ltd.—Winding up voluntarily Liquidator, Mr. E. James, St. Lawrence House, Trump Street E.C. Meeting of creditors, April 27th, at the Institute of Chartered Accountants, Moorgate Place, E.C.

Private Arrangements.

P. M. Braidwood, Somerset Road, New Barnet, and 1, High Street, Barnet, electrical contractor.—A meeting of creditors was held on April 12th, at the offices of Messrs. Goodman Sons & Co., Broad Street House, E.C., when a statement of affairs was presented which disclosed liabilities of £1,885 and net assets of £355, leaving a deficiency of £1,530. A deficiency account was presented which showed that during the seven years to April, 1927, the drawings had totalled £1,068, while there had been an estimated loss on the trading during the period of £337, and for the purposes of the statement the assets had been depreciated by £125. The debtor consulted his accountant during the previous week owing to two writs having been served upon him. The largest creditors suggested that a meeting should be called. The debtor started trading in 1921 with a capital of only £10, and he carried out a number of small contract jobs. He then realised investments amounting to about £200, the money going into the business, and from that time onwards the business increased, and he took on larger contracts. He was also assisted financially by his mother and sister, who were cash creditors. In reply to questions, the debtor stated that he had a contract in connection with a school on which a substantial balance was due, the work having been completed six months ago. He also had a contract in connection with the East Barnet Housing Scheme, where fifty dwellings were being erected. He had been doing a fairly substantial turnover, which during the last nine months had totalled £2,139. He did not think that the business could be continued profitably by him, but relatives were willing to assist him to pay a composition of 5s. in the £, by two equal guaranteed instalments at three and six months. A resolution was passed accepting the offer, and it was decided that Mr. W. A. Osborne, of Messrs. Corfield & Cripwell, Balfour House, Finsbury Pavement, E.C., should act as trustee, together with a committee consisting of Mr. C. Latham, and the representatives of Messrs. Poppleton, Appleby & Hawkins, and Fall Stadelmann & Co., Ltd. The following are creditors:—

	£		£
W. T. Henley's Telegraph Works Co., Ltd.	230	Weinbaum Incandescent and Electric Co. ...	4
Falk, Stadelmann & Co., Ltd.	138	Brown Bros.	2
Young & Wildsmith, Ltd.	87	General Electric Co., Ltd.	2
Charlesworth, Peebles, Ltd.	67	Smith, J. & W. B., Ltd.	2
Macintosh Cable Co., Ltd.	47	Jeary Electric Co. ...	2
		Supra Electric Co. ...	2
		British Thomson Houston Co., Ltd	5

Dissolutions of Partnership.

J. R. Dunkley & Co., electrical engineers, 17, Station Street, Huddersfield.—Messrs. K. Levell and J. R. Dunkley have dissolved partnership. Mr. Dunkley will attend to debts and continue the business under the same style.

S. and S. Radio & Electrical Co., & Exide Battery Service Station, radio and electrical experts, 149, Ewell Road, Surbiton.—Mr. S. C. Slaughtern and Mr. N. P. Sparks have dissolved partnership. Mr. Slaughtern will attend to debts.

E. J. Stiell & Co., electrical engineers, Coatbridge.—The partnership existing between Messrs. E. J. Stiell, D. M. Miller, and W. C. Cullen, has been dissolved by the death of the first-named, and the retirement of Mr. Miller. Mr. Cullen will continue the business under the same style and attend to debts.

Book Notices.

In view of the importance of the paper read by Major E. I. David last year on electricity in mining, the South Wales Branch of the Association of Mining Electrical Engineers has decided to publish it in book form at a price of 1s. 6d. to members, and 3s. to non-members. Copies can be obtained from Mr. H. J. Norton, 11, Windsor Place, Cardiff, at these prices, plus 3d. postage.

"Technology Reports of the Tôhoku Imperial University, Sendai, Japan." Vol. VI, No. 3, "On the Design of an Inductance Coil for Audio Frequencies, having Iron Core with Air Gap." Maruzen Co., Ltd., Tokyo and Sendai.

The Marconi Gramophone Reproducer.

Hitherto the Marconiphone Co., Ltd., has only supplied its gramophone reproducer in conjunction with a special two-stage amplifier. Owing to the demand, however, it has been decided to make the two instruments available separately.

A "Rawlplug" Handbook.

The Rawlplug Co., Ltd., has produced a very useful handbook dealing in detail with the various uses of "Rawlplugs." The methods of boring various materials, such as brick, plaster, tiles, &c., are set out, and the book contains numerous illustrations of typical and special "Rawlplug" jobs.

For Sale.

Yorkshire (West Riding) Electric Tramways Co., Ltd., invites offers, two 320-h.p. four-cylinder Diesel engines, two 200-kW Dick, Kerr generators, switchboard, &c., one reversible booster, and one 10-ton overhead travelling crane. By order of the Liquidator of the New Trafalgar Collieries, Cinderford, Glos., Sir I. Thomas will sell by auction at the Collieries, on April 26th and 27th, the plant and machinery, including electric generators, transformers, motor convertor switchboards, &c. Halifax Tramways and Electricity Committee invites offers for two Weir steam turbo-driven boiler-feed pumps. (See our advertisement pages to-day.)

Chinese Notes.

A considerable business in electrical irrigation is done by the Cheng Hwa Electric Power Supply Co. in the Kiangsu province. The company has a 6,400-kW generating plant and hires out complete pumping plants, including the necessary pole lines, to the farmers. Originally the charge was based upon the area of the fields operated upon, but later the company substituted an electricity consumption basis with a minimum per *mow* (⅙ of an acre) of 10 kWh.

The Pu Hwa Hsing Chi Electric Co. (Wenchav, Chekiang province) now supplies electricity to about 20,000 16-c.p. lamps. It recently reorganised and raised its capital from $100,000 to $150,000. The promoters also run a telephone service (the Tung Wu Telephone Co.), which has over 200 subscribers.

Great Britain's Radio Exports.

The *Wireless Trader* of April 9th published details of our radio export trade during February. The total (excluding re-exports) was £119,767 (valves £23,006), as compared with £88,765 in January (valves £11,532). Japan was again the chief customer, taking goods to the value of £51,904 (as against £14,684); Australia retained second place with £13,132 against £12,980); but the Netherlands succeeded Russia in the third place with a total of £6,830.

Our Foreign Electrical Trade.

The following were the values of imports and exports of electrical goods and machinery during March:—

	March, 1927.	Inc. or dec.
Imports.—	£	£
Electrical goods and apparatus ...	327,988	+40,033
Machinery	1,344,470	+65,865
(Electrical machinery)	138,728	+21,573
Exports.—		
Electrical goods and apparatus ...	959,787	−35,067
Machinery	4,134,580	−11,763
(Electrical machinery)	577,604	+93,191
Re-exports.—		
Electrical goods and apparatus ...	13,494	− 7,066
Machinery	143,492	+22,089
(Electrical machinery)	8,785	− 2,973

Robust Automobile Lamps.

Another example of the survival of an automobile lamp from the effects of a collision is reported by the General Electric Co., Ltd. Although the headlight in which it was fitted was badly hit, the "Osram" lamp still shone out when switched on.

Unemployment.

The reduction in the number of unemployed, which received a check in the previous week, continued during the week ended April 4th, a fall of 7,930 being registered. The actual total was 1,073,800, as compared with 1,081,730 on March 28th and 1,049,790 on April 5th, 1926.

Registered Contractors.

At its meeting on April 8th the Executive Committee of the National Register of Electrical Installation Contractors accepted the following applications for registration. At the same meeting one application was withdrawn and four were declined:—

Anderson & Penny, Ltd., South Shields.
Gee & Brown, Sunderland.
Bulsen, W., & Co., Newcastle-on-Tyne.
South Shields Plumbing Co., Ltd.
Mohan, T. G., Sunderland.
Webber & Hudgell, Hastings.
Foreshaw & Bradshaw, Belfast.
Clark, O., South Shields.
Foote, Milne & Co., London, S.W.9.
Taylor, T. A., Chester-le-Street.
Wight, B., & Co., London, N.10.
Worksop Co-operative Society, Ltd.
Clarke, W. T., & Co., Ltd., London, W.C.1.
Rosson, A. C., Croydon.
Ormerod, W., Todmorden.
Gordemer, A., London, E.5.

Prices of Raw Materials.

Lighting and Power Notes.

Aberdeen.—NEW SUB-STATION.—A new sub-station at the Corporation electricity works, which has cost £35,000, was formally inaugurated by Lord Provost Lewis on April 9th.

Accrington.—HIRE-PURCHASE SCHEME.—It was announced at the April meeting of the Town Council that it is proposed to sell electrical appliances on the hire-purchase system, goods to be paid for on the basis of 1s. per quarter for every £1 in value.

Ashford (Kent).—LOANS.—The Urban District Council has applied for sanction to the following loans:—£5,000 for mains and services; £500 for meters; £900 to cover excess expenditure on generating plant; £500 for domestic apparatus to be let out on hire; and £500 for assisted wiring installations. Street lamps in three portions of the town are to be converted from gas to electricity.

Australia.—VICTORIA.—The *Industrial Australian and Mining Standard* reports that satisfactory progress is being made with the construction of the Rubicon (Vic.) hydro-electric scheme, and the main channel work is now nearing completion. The construction of the diversion weirs on the Royston and Rubicon rivers is well in hand and work on the transmitting sub-station is progressing well, all the foundational construction being completed. The system is to be in operation by 1928, but at the present rate of working the lower power stations will be in operation much earlier.

Canada.—MANITOBA.—A recent Government survey of the water-power resources of Manitoba has revealed the existence of over 3,000,000 continuous h.p. which is available for development. At the present time a total of 225,800 h.p. of turbine plant is in use, with provision to increase this to an ultimate capacity of 310,000 h.p.

Chatburn.—PROTEST AGAINST CHARGES.—At a recent ratepayers' meeting protests were made against the charge of 2d. per kWh, over and above the amount charged by Clitheroe, to consumers in the borough. A resolution was adopted refusing to take supplies except at the Clitheroe rate of 6d. per kWh for lighting and 1½d. per kWh for power.

Continental.—ITALY.—A regulation has recently been issued by the Italian Government which provides that the importation from, or exportation to, adjacent foreign countries of electricity can only be undertaken by special Government permit, which in approved cases will be granted for periods of ten years. A tax of 25 centimos per kWh is to be imposed on all imported energy.

Dover.—ELECTRICITY SUPPLY.—It was reported at a recent meeting of the Electricity Committee that the cost of changing the periodicity of the electricity supply would amount to £20,153. It was decided to engage a consulting engineer to report on the whole of the electricity undertaking, including the question whether or not there should be a change of periodicity.

Dumfries.—LOAN.—The Town Council has applied for sanction to a loan of £4,000 for a new storage battery and battery booster.

Hastings.—NEW TRANSFORMER.—The Electricity Committee has recommended the provision of an additional transformer at Bromsgrove power station, at a cost of £2,345.

India. — HYDRO-ELECTRIC DEVELOPMENT.—According to *Indian Engineering*, it is stated that the South Indian Railway Co. has agreed, subject to certain conditions, to purchase 50 per cent. of the power available from the Pykara hydro-electric scheme. A committee appointed to consider the possibilities of the scheme has reported that the Government can continue the work with confidence.

Formby.—ELECTRICITY CHARGES.—The Urban District Council has reduced the price of electricity for power purposes from 3½d. to 3d. per kWh up to 500 kWh, and introduced a new scale of 2½d. per kWh from 500 to 1,000 kWh, and 2d. per kWh over 1,000 kWh per annum. The scale of charges for lighting purposes remains unchanged.

Leeds.—NEW POWER STATION.—The Electricity Commissioners have sanctioned the erection of a new generating station at Kirkstall by the Corporation.

London.—HAMMERSMITH.—The Electricity Committee has received a report from the borough electrical engineer upon the question of augmenting the existing e.h.p. ring main in order to meet the increasing demand of consumers supplied from the Starch Green sub-station, including the Chiswick Electric Supply Corporation, Ltd., and has recommended the laying of a duplicate .075 sq. in. six-core cable from the power station to Rivercourt Road sub-station, at an estimated cost, including the provision of switchgear at the power station, of £4,659.

ST. PANCRAS.—The Borough Council has received a reply from the Electricity Commissioners regarding its proposal to install additional plant at King's Road station. The Commissioners state that the policy of inter-connection is preferable to the installation of additional plant, and suggest as an alternative that inter-connection between (1) St. Pancras Islington and Hackney; (2) St. Pancras, St. Marylebone, and the London Power Company's station at Grove Road; and (3) St. Pancras and the City Road station of the County of London Electric Supply Company, should be explored to meet the Council's requirements.

OPPOSITION TO SCHEME.—The London Power Co., Ltd., has notified the L.C.C. that it has applied for sanction to erect a power station between the south bank of the River Thames and the Great Western Railway goods depôt in Battersea Park Road. As the L.C.C. has property near the site, the Parliamentary Committee of the L.C.C. has recommended that the proposal be opposed, if necessary, with a view to obtaining protection for the Council's interests.

Macclesfield.—ELECTRICITY SUPPLY.—The Town Council has decided to engage an expert, at a fee of £700, to prepare a report with regard to the local electricity supply and its possible development in the future. This is with a view to the probable purchase of the local electricity undertaking.

Maybole.—STREET LIGHTING.—The rival claims of electricity and gas for street lighting were discussed at the last meeting of the Town Council. A report by Mr. Campbell Murray, M.I.E.E., letters from Mr R. B. Mitchell, manager, Glasgow Corporation Electricity Department, and Mr. Bexon, manager of the Ayrshire Electricity Board, were read. The last stated that he would recommend his Board to provide steel poles throughout the burgh, free of any extra cost, provided the Council agreed to take electricity for street lamps. The cost of furnishing the street lights would be approximately £12 per lamp. The Gas Company quoted an all-in price of 35s. per lamp per annum for a ten-years' contract. It was agreed to accept the Electricity Board's offer.

New Zealand.—ARAPUNI HYDRO-ELECTIC SCHEME.—The Auckland correspondent of the *Daily Telegraph* reports that it is announced officially that the Arapuni hydro-electric scheme to supply the whole of Auckland province with electricity will not be completed until the end of 1928 owing to delays caused by floods. Messrs. Armstrong Whitworth's contract date for the completion of the work is April, 1928.

Portland.—ELECTRICITY SUPPLY.—At a recent meeting of a Special Committee of the Urban District Council the report from Messrs. A. Hugh Seabrooke & Partners on a scheme for the supply of electricity at an estimated initial cost of from £9,000 to £10,000 was considered, and approved.

Pontypridd.—INAUGURATION OF EXTENSIONS.—The Earl of Plymouth has consented to formally inaugurate, on April 26th, extensions which have recently been carried out at the power station of the South Wales Electrical Power Distribution Co.

Preston.—ELECTRICITY SUPPLY.—At a recent meeting of the local Trades Council it was stated that after the fourth generating set had been installed, the Corporation intended to introduce a block system for the distribution of electricity. Instead of having a meter for each house, one meter would serve for a whole street, and in time electricity would be paid for as consumers now paid for water.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

STOKE NEWINGTON.—Lighting: Scale B, from 5d. to 4½d. per kWh. Power: Maximum demand system, from 4½d. and 1d. per kWh to 4d. and 1d.; scale E, from 2d. per kWh for the first 5,000 kWh per annum and 1½d. per kWh beyond, to 2d. per kWh for the first 5,000 kWh, 1½d. for the next 5,000, and 1d. per kWh for all further consumption. Domestic scale: From 1½d. to 1d. per kWh. Public lighting: The increase added in September last to be removed.

HENDON.—*The Hendon Electric Supply Co., Ltd.*—The surcharge of ¼d. per kWh, due to the coal dispute, has been withdrawn.

SCUNTHORPE.—Lighting: From 7d. to 6d. per kWh. Power: From 3½d. to 2½d. per kWh.

Ripon.—ELECTRICITY SUPPLY.—The City Council has accepted terms offered by the Harrogate Corporation Electricity Department to supply electricity to the city. The scheme is subject to confirmation by the Harrogate Town Council, and follows the recent purchase by the latter authority of the Knaresborough electricity undertaking. Harrogate hopes to extend its supply to a wide area in which the chief centres of population are the three towns mentioned.

Rothesay.—INAUGURATION OF SUPPLY.—A new power station was formally inaugurated by Mrs. Fisher, wife of ex-Provost Fisher, on April 12th.

South Africa.—CAPE TOWN.—A special meeting of the City Council was held recently for the purpose of adopting a proposal to borrow £500,000 for electrical development. The programme includes (*a*) land and buildings, £30,000; (*b*) machinery, £87,750; (*c*) distribution, £382,250. A meeting of enrolled owners was subsequently held and the proposals were unanimously agreed to.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the Urban District Council of Portland, authorising it to supply electricity in its area, and the Woodstock Power Syndicate, Ltd., to supply electricity in the borough of Woodstock and certain parishes in the rural district of Woodstock.

The Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them for the supply of electricity by Blackpool Corporation in the urban district of Poulton-le-Fylde, and certain townships in the rural district of Fylde, and the West Lancashire Rural District Council in the parishes of Maghull and Lydiate.

Stockport.—Electrical Development.—The Electricity Committee has recommended that application be made for sanction to a loan of £260,000, being the estimated cost of the first section of a scheme for the further development of the Millgate electricity works. This includes the installation of one 25,000-kW turbo-alternator at a cost of £65,000, four 50,000-lb. boilers (£67,000), and buildings (£60,000). According to the *Cheshire Daily Echo*, the borough electrical engineer (Mr. R. Lomax), in his report, states that the Millgate site can be developed to a capacity of from 130,000 to 140,000 kW. The extension proposed at present would increase the capacity of the station to 57,000 kW. The cost of the full development of the site is estimated at £900,000, the cost of the plant being under £10 per kW.

Torquay.—Loan Sanctioned.—The Electricity Committee has received sanction to the borrowing of £5,383 for the extension of the Upton Valley sub-station and the erection of stores adjoining the destructor.

United States.—Electrical Development.—According to the *Electrical World*, power companies in Texas are to carry out extensions of transmission lines during this year aggregating more than 500 miles, which will add 75 communities to the list of towns supplied with electricity. The Texas Power and Light Co. is negotiating for the purchase of the dam across the Colorado River at Austin, and proposes to spend $1,000,000 in rehabilitating the dam and hydro-electric plant. During 1926 the company put into operation the new Trinidad power station with an initial capacity of 50,000 kW. This station is designed for an ultimate capacity of 160,000 kW. The Dallas Power and Light Co. is installing an additional 25,000-kW set, and is to carry out extensive additions to its transmission line network. The power companies of Texas have a total of 4,500 miles of h.p. transmission lines, serving more than 350 towns and cities in an area covering the greater portion of the State. There are 33 generating stations connected to this system, which have a combined capacity of approximately 320,000 h.p.

Walsall.—Extension of Supply.—The Town Council has under consideration a proposal to extend the e.h.p. feeder to the Scott Arms and to erect a sub-station for the supply of electricity to Great Barr.

Yarmouth.—Loan Sanctioned.—The Corporation has received sanction to a loan of £50,229 for mains, buildings, plant, and works consequent upon the change of system, in addition to a loan of £120,000, previously sanctioned. The Electricity Commissioners have intimated that they will consider further loans, if necessary, when the final cost has been ascertained.

Tramway and Railway Notes.

Blackburn.—Tramway Extension.—The Town Council has referred to the General Purposes Committee the question of extending the existing tramway and the seeking of powers to run motor-'buses.

Canary Islands.—Teneriffe.—The tramway undertaking in Teneriffe, owned by a Belgian company, has been sold to a Canary Islands syndicate for 500,000 pesetas.

Continental.—Italy.—A convention has been signed between Italy and the Republic of San Marino for the construction of an electric railway between Rimini and San Marino.—*Reuter's Trade Service* (Rome).

Czecho-Slovakia.—The Austrian Schuckert Co., of Vienna, is negotiating for the construction of a narrow-gauge electric railway in North Bohemia, between Warnsdorf and Rumburg, on the Saxon frontier.

Gravesend.—Abandonment of Tramway.—The Ministry of Transport has notified the Corporation that an Order will be issued for the abolition of the Gravesend and Northfleet tramways.

Irish Free State.—Dublin-Lucan Electric Tramway.—The Dublin United (Electric) Tramway Co.'s Bill for taking over the Dublin-Lucan electric tramway and linking up the line with the city service at Parkgate Street has now passed both Houses of the Free State Legislature and will become law immediately. Work will begin shortly on the repair of the line and on the necessary alterations at the Dublin end.

Nottingham.—Railless Cars.—An innovation with regard to municipal transport arrangements has just been introduced by the utilisation of railless cars upon the Sherwood Rise route. Ten of these cars have been placed in commission and are proving satisfactory.

Sheffield.—Inauguration of Route.—The new Abbey Lane section of the Corporation tramways was formally inaugurated by the chairman of the Tramways Committee, on April 14th. This section completes the circular City-Millhouses-Woodseats-City route; the cars run on one side of the road and vehicular traffic on the other. Where it is necessary to cross over, various safety devices have been adopted, including electric signals, which can be illuminated at night to warn other traffic that a car is about to cross.

United States.—Railway Electrification.—Work on the construction of the tunnel in the Cascade Mountains, Washington, which will cost $10,000,000, is making good progress, and indications are that it will be completed before the end of next year. With its completion approximately 100 miles of the Great Northern railway will be electrified. The *Electrical World* reports that the Washington Water Power Co. has taken over and is developing the Chelan River power project with a view to the eventual electrification of the Great Northern railway east of Wenatchee and through Northern Idaho. Full development of this power, it is estimated, will cost $10,000,000. The arrangement with the Washington Water Power Co., while safeguarding future needs of the Great Northern railway for electrification purposes, provides for making power available for public use, and making possible the irrigation of several thousand acres of land now idle. The Chelan power project is unrelated to the electrification of the line between Wenatchee and Everett. Power for that part of the line will be supplied from hydro-electric plants on the west side of the Cascade Mountains. In connection with this electrification, the Great Northern already has in service two new electric locomotives of the motor-generator type built by the Baldwin Locomotive Works and the Westinghouse Electric and Manufacturing Co. They are the most powerful of their kind, each of them weighing 715,000 lb. and having a tractive force of 88,500 lb.

Telegraph and Telephone Notes.

Continental Telephony.—Long-distance Communication.—As the result of successful trials, direct telephone communication between Prague, Stuttgart, and Paris has been established, and a regular service has been opened. Tests are now being carried out between Paris and Budapest, the underground cable between Paris and Vienna being utilised, and then the overhead wire between Vienna and Budapest; so far the tests have been considered quite satisfactory.—*Reuter* (Paris).

Telephone communication by the new cables recently installed between Brussels and Antwerp and London has been satisfactorily tested, and the new lines will be opened for public use at the end of the month.

India.—"Beam" Radio-Telegraphy.—It was recently announced in the Council of State at Delhi that official "beam" radio-telegraph transmission tests from the Poona station would commence in May and that the service would actually commence in June. The Indian system consists of a transmitting station situated about six miles from Poona. The site is at an elevation of about 2,200 ft. above sea level, and the area at present utilised for the buildings and aerial system does not exceed 20 acres, but considerable space has been allowed for any extensions which may be made in the future. Heavy fuel oil is used for power production. The receiving station is situated about four miles from the small town of Dhond and about 50 miles from the Poona station, and lies in open, wide country, so that there is no screening to interfere with the reception of signals. These stations will link with the Grimsby transmitter and Skegness receiver in England (the latter are described elsewhere in this issue).

Bombay Telephones.—The Bombay Telephone Co. has earned a good profit for the year 1926 in spite of trade depression. It is proposed to introduce the message-rate system, experience of this at Calcutta having shown that in the case of business, as well as residential, areas over 65 per cent. of the users are paying less under that system of charging than they would have paid under flat rates. The slight opposition to the introduction of the message-rate system in Bombay will therefore soon be overcome.

San Marino.—New Radio Station.—A convention has been signed by representatives of Italy and the Republic of San Marino for the construction of a wireless station at San Marino.—*Reuter's Trade Service* (Rome).

Santo Domingo.—New Radio-Telegraph Plant.—The Minister of Promotion and Communications has ordered new equipment for the radio station at Santo Domingo, South America (the international call letters assigned to the Republic being HIA-HIZ), to provide direct communication with New York, 1,225 miles distant, and other stations within a radius of 1,500 miles. The old equipment will be utilised at a radio station to be erected at Puerto Plata, the principal seaport on

the north coast of the island, and it is also proposed to install a low-power station at Sanchez, on the Bay of Samaná.—*Reuter's Trade Service* (Santo Domingo).

Transatlantic Cables.—Storm Damage.—The "beam" radio-telegraph service assisted in coping with traffic congestion last week, which was caused by the interruption of operation of one of the Imperial cables across the Atlantic Ocean, which the *Evening News* explains was "cut" in bad weather off the Newfoundland coast. At the same time the aurora borealis interfered with all traffic *via* Newfoundland and Nova Scotia.

United States.—Telephone Service Growth.—Remarkable figures indicative of the growth of telephone service in America during recent years are contained in the annual report of the American Telephone and Telegraph Co. for 1926. On December 31st, 1910, there were 5,882,719 telephones in the country, by means of which 22,284,010 calls were made every day; in December, 1926, there were 17,574,252 telephones (almost a threefold increase), and 52,354,834 calls were made daily. The total value of the plant has increased from 611,000,000 dollars (about £122,200,000) in 1910 to 2,783,000,000 dollars (about £556,600,000) in 1926; more than 255,000,000 dollars (£51,600,000) was spent on plant during 1926. It is notable that, as the sphere of a telephone system widens, the cost per telephone rises: the cost per telephone in America, which was 157.16 dollars in 1910, had risen in 1926 to 218.27 dollars. In 1900, when there were some 10,000 stockholders, the revenue of the company was 45,000,000 dollars (£9,000,000); in 1926 the revenue was 844,000,000 dollars (£168,800,000) and the number of stockholders 400,000, the largest number recorded in any one business venture.

Radio Notes.

Bulgaria.—Reception Ban Removed.—Bulgarian citizens have hitherto not been allowed to use wireless, the only sets permitted in the country being those belonging to Government administrative bodies, the Ministry of War, and Bulgarian merchant vessels. The Government has now, however, decided to permit their use by the general public, although transmission will remain a State monopoly. Owners of receiving sets will be required to pay a fixed subscription and to undertake to conform to such regulations as may be made.—*Reuter* (Sofia).

Colombia.—Improved Service.—In his message to Congress, the President of Colombia, South America, announced the immediate provision of an improved broadcasting service. Twelve sets are to be used, all of high power (the international call letters assigned being HJA-HKZ). The message has attracted much favourable attention, as hitherto there has been no broadcasting in Colombia, where static is bad during most of the year in the greater part of this extremely mountainous country. The best reception is obtained from January to March. The recently-opened stations at Caracas (Venezuela) and Balbóa (Panamá) are expected to benefit broadcasting in Colombia.—*Reuter's Trade Service* (Bogota).

New Continental Stations.—Italy.—The publication is expected of a decree-law instituting a new company to take over the wireless telephony services, and appointing a supervisory committee. The decree will fix the composition of the board of the company and the staff of artists, which is to be predominantly Italian, and require the execution of the following technical plan: the replacement of the present station at Milan by another of 7 kW; the erection at Genoa of a 11.5-kW station; at Rome, one of 25 kW; at Florence, Turin, Naples, and Bari stations of 3 kW, and at Palermo one of 7 kW.—*Reuter's Trade Service* (Milan).

The new transmitter at Milan, which will deliver 7 kW to the aerial, is nearing completion.

The Italian Government Commission examining broadcasting finance has adopted a resolution recommending the Government to impose a small tax. All Italians are instinctively against the suggestion of a licence tax, says the *Financial Times*.

Sweden.—The new Motala station, which has been testing for some time, was to begin regular operation before Easter.

Finland.—A station is to be built in Lahtis at a cost of about $200,000, which is part of a loan granted the country by an American concern. At present there are only two radio stations in Helsingfors and one in each of the following towns:—Tammerfors, Bjorneborg, Lahtis, Jyvaskyla, and Jakobstad. The stations in Helsingfors belong to the Army and those in the other towns are privately owned. None of them is equipped for modern broadcasting, says *Commerce Reports*, and it is expected that the new station will stimulate interest and increase the sale of equipment.

India.—Listeners Increase.—According to the annual report of the committee of the Bombay Radio Club for the year 1926, the number of members increased during the year to 585. The Club had broadcast upwards of 300 concerts, and the programmes were received in places many hundreds of miles distant. It is intended by the Technical Committee to install in the current year small transmitters, of both long and short waves, for communication with other amateur stations in India and to start a class in Morse receiving and dispatching, if sufficient members accord their support. It is expected that the Indian Broadcasting Co. will commence its regular broadcasting services from Bombay and Calcutta in August next. Mr. Page, director of the Bombay station, and Mr. Wallace, director of the Calcutta station, have both arrived in India. The transmitting station of the company will be 120 times as powerful as the present Bombay station (2FV).

New Zealand.—New Station.—Wellington is shortly to possess a 5-kW station. In both Auckland and Christchurch there are good stations, says *World Radio*, but so far Wellington and Dunedin have each had only a very small station. The number of licensed listeners in New Zealand is at present 13,000.

Poland.—New Station.—The Polish Broadcasting Co. (Poleskie Radio) has just placed a contract for a 10-kW station to be erected at Katowice. The equipment will be manufactured in London at the works of Standard Telephones and Cables, Limited. This order follows on the recent successes of this company in obtaining contracts in face of foreign competition for broadcasting equipments for the Irish Free State, Denmark, Japan, and New Zealand.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the Electrical Review containing the advertisement is given in parentheses below.

Contracts Open.

Australia.—Melbourne.—May 10th. Postmaster-General's Department. Telephone relays. (B.X. 3333.)*
May 17th. Resistances and reactances. (B.X. 3307.)*
May 23rd. State Electricity Commission. Switchgear and accessories. (B.X. 3285.)*
May 9th. 6,600-V transformers and spares. (B.X. 3331.)*
June 1st. Victorian Government Railways. Electric time-releasing mechanisms. (B.X. 3431.)*
July 5th. One 15,000-kW steam turbo-generator and accessories. (B.X. 3338.)*
Sydney.—May 9th. Electricity Department. Station auxiliary switchgear. (B.X. 3338.)*
April 26th. A.C. electricity meters. (B.X. 3407.)*
June 22nd. New South Wales Government Railways. Remote control switchgear. (B.X. 3442.)*

Barking.—May 9th. County of London Electric Supply Co., Ltd. Cables and accessories for the Barking power station. (April 1st.)

Belgium.—April 28th. Schaerbeek Municipal Council. 11 kilometres of h.p. and l.p. armoured cable. Particulars (Cahier des Charges), for 10 francs from Service de l'Electricité, Hotel Communal, Schaerbeek.

May 9th. The Limbourg Provincial authorities at Hasselt. 1648.5 metres of h.p. armoured cable for Eysden. Particulars (Cahier des Charges), for 10 francs from Service de l'Electricité, 27, Avenue Bamps, Hasselt.

Colombia. — Bogota. — April 30th. Ministry of Public Works. Two electric lifts. (A.X. 4433.)*

Dublin.—April 30th. Electricity Department. E.h.p. and l.p. cables, cast-iron and stoneware troughing, section pillars, compound and other materials and accessories. (April 15th.)

Edinburgh.—April 25th. Education Authority. Electric installation at North Junction Street School. Plans and schedules from office of the Authority.

May 2nd. District Board of Control. Electricians' work at new buildings at Gogarburn Institution. Mr. Stewart Kaye, architect, 14, Hill Street, Edinburgh.

Egypt.—Cairo.—May 24th. Director-General of Prisons. Twelve months' supply of electric lamps, &c. (C.X. 2268.)*

Grimsby.—May 2nd. Electricity Department. E.h.p. and pilot cables; l.p. feeder cables. (April 15th.)

Ilford.—April 26th. Electricity Department. One 1,500-kW motor-convertor or rotary-convertor and transformer, 6,600-V switchgear cubicles and alterations to existing switchgear. (April 8th.)

India.—India Store Department. April 26th. 66-kVA motor-driven alternator sets, transformers, switchgear, &c. (April 1st.) Telephone cable. (April 8th.) 53,825 inert electric cells. (April 15th.)

Kendal.—April 30th. Board of Guardians. Electric light installation at the Institution; Mr. G. Cotton, clerk, 14, Lowther Street. (Returnable deposit of £2.)

London.—London County Council.—April 26th. Wiring and fitting for electric lighting in two blocks of tenements at the Ring Cross housing estate, Islington (approx. 274 wiring points). (April 8th.)

St. Marylebone.—May 18th. Electricity Department. L.p. and e.h.p. cables for 12 months. (April 15th.)

Metropolitan Asylums Board.—April 25th. Installation of electric lighting, telephone, fire alarm and domestic bells in the engineer's house at the Western Fever Hospital, Seagrave Road, S.W. (April 15th.)

Islington.—June 1st. Electricity Department. Steel-tube lamp columns, 2,200-V feeder switchgear, rotary and/or static power factor correctors. (See this issue.)

Manchester.—May 5th. Electricity Committee. Twelve months' supply of electric kettles, potential and current transformers, electricity meters, and cable supplies. (See this issue.)

New Zealand.—Wellington.—May 31st. Public Works Department. 50-kVA transformers for the Waikaremoana electric power scheme. (B.X. 3294.)* 50-kVA transformer for Arapuni scheme. (B.X. 3293.)*

June 21st. Sub-station switchgear and metering equipment for Arapuni. (B.X. 3398.)*

June 7th. Railway sub-station equipment, Lake Coleridge electric power scheme. (B.X. 3295.)*

June 13th. New Zealand Railways. Machine tools, workshop equipment and overhead electric travelling cranes. (A.X. 4344.)*

June 6th. Six electric locomotives. (A.X. 4355.)* Overhead equipment for the Christchurch-Lyttelton electrification scheme. (B.X. 3301.)*

Invercargill.—May 31st. Southland Electric Power Board. Transformers. (B.X. 3379.)*

June 15th. 66,000-V oil circuit-breakers. (B.X. 3378.)*

Lyttelton.—July 20th. Harbour Board. Four 5-ton electrically-operated portal cranes, and ten electrically-operated capstans. (A.X. 4532.)*

Oldham.—April 30th. Electricity Department. Coal-handling and conveyor plant. (April 15th.)

Plymouth.—April 25th. Electricity Department. Electricity meters, cables, and transformers. (April 1st.)

Prestwich.—County Mental Hospital.—Supply and fixing of electrical cooking apparatus, &c., at the annexe kitchen. (See this issue.)

South Africa.—Johannesburg.—May 7th. Municipal Council. Electric street lamp fittings and globes. (B.X. 3395.)* Cables. (B.X. 3406.)*

May 12th. Transformers. (B.X. 3415.)*

Cape Town.—June 1st. The University. Electric cooking utensils for the new residences at Groote Schuur. (B.X. 3393.)*

Southend-on-Sea.—April 28th. Light Railways and Electricity Department. 12 months' supply of lubricating oils. (See this issue.)

Stafford.—April 30th. Staffordshire Education Committee. Electric wiring and fittings for the new infants' department of the Slater Street Council school and in the additional class rooms, laboratory, &c., in the Salisbury Street central school. (April 8th.)

Uruguay.—Montevideo.—June 15th. State Electricity Supply Works. 15 transformer sub-station equipments (6,600/220 V, 50 cycles). (B.X. 3371.)*

Five overhead transformer sub-stations mounted on tubular or section iron columns. (B.X. 3430.)*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Barking Town.—Electricity Committee.
Cable—

Power & Lighting Cables, Ltd. (Recommended)	**£469**
A.C.E.C.	606
Standard Telephones & Cables, Ltd.	668
Hackbridge Cable Co., Ltd.	674
Union Cable Co., Ltd.	683
Siemens Bros. & Co., Ltd.	695
Enfield Cable Works, Ltd.	695
W. T. Henley's Telegraph Works Co., Ltd.	706
Pirelli-General Cable Works, Ltd.	707
Johnson & Phillips, Ltd.	713
Callender's Cable & Construction Co., Ltd.	718
British Insulated Cables, Ltd.	720

Bolton.—Electricity Committee. Accepted:—
Induced draught plant at power station.—Musgrave & Co., Ltd.

Tramways Committee. Accepted:—
500 tons of Sandberg steel tram rails.—Cargo Fleet Iron Co., Ltd.

Burton-on-Trent.—Electricity Committee. Accepted:—
Switchgear (£1,252).—Ferguson, Pailin, Ltd.

Croydon.—Electricity Committee. Accepted:—
Switchgear, Lower Coombe Street sub-station (£647), one feeder and two transformer panels for Thornton Heath (£473), and one feeder panel for Drovers Road (£167).—A. Reyrolle & Co.
Switchboard, &c., at Duro Rubber Co.'s sub-station (£107), 22 switch panels for extension of switchboards at various h.p. stations (£721).—Ferguson, Pailin, Ltd.
Four banks of 6,300-V, 3-phase, Scott-connected oil-cooled transformers, one 250-kVA ditto, and one 100-kVA ditto (£2,325).—British Electric Transformer Co., Ltd.
Boiler feed pump (£337).—Mather & Platt

Dumfries.—Town Council. Accepted:—
Battery booster (£434).—Lancashire Dynamo Co., Ltd.

East Ham.—Works Committee. Accepted:—
Automatic switches for electric lamps.—British Foreign and Colonial Automatic Light Controlling Co., Ltd., Tyer & Co., Ltd., and Acme Lighting Engineering Co.

Glasgow.—Tramways Committee. Recommended:—
Gear cases (steel).—W. C. Yuille & Co., Ltd., and Metropolitan-Vickers Electrical Co., Ltd.

Lamp Contracts.—Brentford, Holborn and Belfast Board of Guardians and the London, Midland & Scottish Railway have placed 12 months' contracts for Osram Lamps with the General Electric Co., Ltd. Belfast City Council has placed a 12 months' contract for Mazda electric lamps with the British Thomson-Houston Co., Ltd. The Port of London Authority has placed a six months' contract for Siemens lamps with the Siemens & English Electric Lamp Co., Ltd.

London.—General Post Office.—Accepted:—
Rectifying valves.—Edison Swan Electric Co., Ltd.

Shoreditch.—Lighting Committee. Accepted:—
One 20-ton hand-operated crane (£199).—Vaughan Crane Co., Ltd.

Southern Railway. Accepted:—
20 rotary convertors and 60 transformers in connection with the electrification scheme (approx. £120,000).—Allmanna Svenska Elektriska Aktiebolaget of Sweden.

Manchester.—Tramways Committee. Accepted:—
Assembled commutator segments for B.T.H. and B.W. armatures; armature coils for B.T.-H. and B.W. equipments.—Manchester Armature Repair Co., Ltd.
Tramway rail bonds.—Forest City Electric Co., Ltd.

Sheffield.—Electricity Committee. Accepted:—
12,000-volt switchgear at Blackburn Meadows (£3,811).—A. Reyrolle & Co., Ltd.
Erection of new chain grate stokers and accessories for boilers at Neepsend (£3,075).—Ed. Bennis & Co., Ltd.

South Shields.—Tramways Committee. Accepted:—
30 tons of tram rails (£295).—Cargo Fleet Iron Co., Ltd.
Three movable points (£258).—Malleable Steel Castings Co., Ltd.

Torquay.—Electricity Committee. Accepted:—
Two 72-inch screens in connection with new pump house at Newton Abbot (£1,720).—Brackett & Co.
Special Larner-Johnson valves for pumps (£256 per valve).—Blakeborough & Co.
Boiler house plant (£24,226).—Stirling Boiler Co., Ltd.
6,000-kW turbo-alternator, with condensing plant (£25,949, plus £242 for an extraction pump).—British Thomson-Houston Co., Ltd.

Wakefield.—Housing Committee. Accepted:—
Wiring 150 houses on the Snapethorpe Estate.—H. Smith.

Forthcoming Events.

Junior Institution of Engineers.—Tuesday, April 26th. Monico Restaurant. 6.30 p.m. Annual dinner.

Friday, April 29th. 39, Victoria Street, S.W. 7.30 p.m. "The Design and Balancing of 3-phase L.P. Distribution Systems." Mr. W. F. Cooper.

Birmingham Electric Club.—Friday, April 22nd. Grand Hotel. 7 p.m. "Radiation Effects." Mr. J. B. Kramer.

Association of Mining Electrical Engineers (North of England Branch). — Saturday, April 23rd. Durham. "Accumulators," Mr. A. W. Bridges. "Electrical Testing Gear for Collieries," Mr. H. J. Fisher.

Institution of Electrical Engineers (Mersey and North Wales (Liverpool) Centre).—Monday, April 25th. University, Liverpool. 7 p.m. Annual general meeting. Short papers by members.

(North-Eastern Centre).—Monday, April 25th. Armstrong College, Newcastle-on-Tyne. 7 p.m. Annual general meeting.

(Scottish Centre).—Friday, April 29th. University College, Dundee.

(South-Midland Centre).—Wednesday, April 27th. University, Birmingham. 7 p.m. Kelvin lecture, "High-Frequency Currents." Prof. E. W. Marchant.

Royal Society.—Monday, April 25th. 8 p.m. Cantor Lecture. "The Measurement of Light." Mr. J. W. T. Walsh.

Illuminating Engineering Society.—Tuesday, April 26th. At 5.30 p.m. Visit to the Photometric Section of the National Physical Laboratory, Teddington. 7 p.m. "Work in the Photometry Department of the National Physical Laboratory." Mr. H. Buckley.

Batti-Wallahs' Society.—Tuesday, April 26th. Hotel Cecil. Luncheon. "How to Reconcile Relations Between the Consumer, the Producer, and the Wage-earner." Sir Arnold B. Gridley.

Institute of Wireless Technology.—Wednesday, April 27th. Engineers' Club. 7 p.m. "The Electrical Recording and Reproduction of Gramophone Records." Mr. H. J. King.

Royal Institution.—Friday, April 29th. 9 p.m. "Wireless Transmission and the Upper Atmosphere." Mr. E. V. Appleton.

Notes.

The International Electrotechnical Commission.

According to *Génie Civil*, the I.E.C. is to meet this year at Bellagio, on Lake Como, from September 5th to 12th, and at Rome on September 21st, for the final session. In the interval the members will visit Milan, Venice, Florence, and various hydro-electric works, under the ægis of the Italian Electrotechnical Committee. The sectional committees of the International Illumination Commission will meet at Bellagio from August 31st to September 3rd; many of its members belong to both Commissions, and will take part in the sessions and tour of the I.E.C.

The Electrical Trades Benevolent Institution.

The annual general meeting of this Institution will be held at the offices of the Institution of Electrical Engineers, London, on Thursday, April 28th, at 2.30 p.m.

Battery Traction in Belgium.

With M. L. Herry, director-general of the Centrales Electriques des Flandres, as chairman, there has been formed the Syndicat d'Etudes pour le Developpement de la Traction Electrique par Accumulateurs for the development of electric battery traction in Belgium. The chairmen of the various sections have been chosen as follows, says the *Electric Vehicle*:—Electricity supply: M. Lechien, president of the Union des Exploitations Electriques en Belgique; electrical materials: M. Rousseau, director-general of the Ateliers de Constructions Electriques de Charleroi; automobile: le Comte J. de Liejekerke, president of the Chambre Syndicate des Constructeurs d'Automobiles et de Cycles de Belgique; accumulator: J. Van de Wiele, of the Tudor Company. The secretary of the new Association (address: 158, Rue Royale, Brussels) recently visited England to study conditions and the activities of the British Electric Vehicle Committee.

Artificial-Light Treatment for Children.

The Artificial Light Department at the Victoria Hospital for Sick Children, Tite Street, Chelsea, was formally opened recently. According to *The Times*, Dr. Murray Levick stated that from 50 to 60 treatments were being given *per diem*; nearly 4,000 treatments had been given since the department began work. The hospital had a special batch of cases suffering from tuberculous glands, and these were doing well. The results obtained up to the present justified the conclusion that children living in their own homes and coming for a prolonged course of this treatment three times a week progressed as well as those who were sent to expensive Alpine institutions.

Better Lighting.

In the course of a lecture recently delivered at Bedford Town Hall before a large audience, under the auspices of the Electrical Power Engineers' Association, on "Better Lighting for Shop and Home," Mr. R. H. Rawll, A.M.I.E.E., of the City of Birmingham Electricity Department, emphasised that the consumer should not merely consider the cost of electricity, but should also know how much light he was getting from it. Good lighting was a business investment, for the purpose of bringing in more business. Lighting shop windows after closing hours was effective advertising and could be done very cheaply.

B.E.S.A. Publication.

A recent publication of the British Engineering Standards Association is a B.S.S. for gear wheels and pinions for electric tramcars. One of the difficulties to be overcome in preparing the work was that although the dimensions were to some extent similar, each manufacturer worked to a slightly different formula for the tooth form, in addition to making use of many different materials and heat treatments for the manufacture of the wheels. It was recognised that with the advent of high-power motors and increased speeds on tramways it was essential not only to effect standardisation to provide interchangeability, but also to collect all the available knowledge of the materials used, and committees were formed, consisting of the makers of gears, representatives of the tramway undertakings, steel manufacturers and metallurgists, to go into the whole matter. Already a large number of gear wheels and pinions have been made to this specification, and it has been established that these are superior to those previously manufactured.

In addition to standard sizes and formulæ for tooth form, specifications of materials and heat are included for case-hardened forged gear wheels and pinions, case-hardened cast gear wheels, "45" carbon-steel forged gear wheels and pinions (water-hardened and tempered), and cast gear wheels (water hardened and tempered). There should therefore be no difficulty for tramway engineers to select the material best suited to their individual requirements and conditions of running. Copies of the specification (No. 235-1927) can be obtained from the Publications Department, British Engineering Standards Association, 28, Victoria Street, London, S.W.1, price 2s. 2d., post free.

Waste-Heat Recovery.

In a paper on "The Recovery and Utilisation of Heat from the Exhaust Gases of Internal-combustion Marine Engines," read recently before the Institute of Marine Engineers by Mr. T. Clarkson, the thimble-type boiler is claimed to fulfil the ideal requirements of a waste-heat boiler. It was originally designed to meet the extremely stringent conditions met with in the problem of road transport, and the remarkable properties which it demonstrated in this service led to the suggestion that it should be used to deal with the waste gases from internal-combustion engines. It is claimed that, as the boiler tubes are secured at one end only, perfect freedom of expansion is obtained for each individual tube, and consequently no strain due to varying thermal expansion is imposed upon the tube joints. By spacing the thimble tubes closer together towards the outlet end, the effect of the gradual cooling down of the gases as they pass through the boiler can be easily compensated for. The author gives 300 deg. F. as the general practical limit beyond which the gases should not be cooled. One difficulty which is met with by designers of waste-heat boilers is the fact that there are no standard diameters of exhaust pipes in relation to horse power. It is always desirable to keep the exhaust pipe as small as possible, consistently with the avoidance of back pressure. Tests by Prof. Gilbert Cook have shown that an efficiency as high as 86 per cent. of heat recovery can be obtained.

Irish Free State Electricity Supply.

At a meeting of the General Committee of the Dublin Mercantile Association, Ltd., last week, a strong resolution was passed protesting against the action of the Irish Free State Government in promoting legislation which would deprive the ratepayers of Dublin, and consumers of electricity in Dublin and elsewhere, of the undertakings built up with their money and credit without adequate compensation, and calling on the Government and members of Dail Eireann to amend those provisions by providing equitable compensation for all property, public or private, taken over. The resolution added:—"That in the event of the Dail passing the Electricity (Supply) Bill, 1927, in its present form, we call on the members of the Senate to reject it."

A Small Hydro-Electric Plant.

With reference to the article under the above heading in our issue of April 1st, describing the hydro-electric scheme of the Northern Nigeria (Bauchi) Tin Mines, Ltd., it should have been stated that the information was derived from an article, "A.S.E.A. in Nigeria," by John F. Shipley, M.I.E.E., published in the A.S.E.A. *Journal*.

Educational.

The B.B.C. announces that the 24-page programme and syllabus of transmissions to schools is about to be issued for the period May to July. All stations are well provided with interesting material.

Market-Place Lighting.

The accompanying illustration depicts the system adopted by the Aylesbury electricity undertaking (engineer and manager: Mr. W. A. Turnbull, A.M.Inst.C.E.) for supplying electricity to about 30 stalls in the Market Place for lighting. Permanent sockets in the ground between the rows of stalls accommodate poles, from which are suspended C.T.C. cables. A 3-core cable supplies each row of poles, the connections

Overhead Cables, Aylesbury Market Place.

being made by means of plugs and sockets. Sockets, with fuses, are permanently fixed on each pole, and leads to the stalls are plugged in as required. The lighting is required on Saturdays, and one man does the whole of the work of erecting and dismantling the poles and wires in an 8½-hour day. A fixed charge per lamp is made to the stallholders, who are very pleased with the arrangement.

An Overspeed Test-House.

The Metropolitan-Vickers Electrical Co., Ltd., has built an overspeed test-house at its Trafford Park works which is designed to deal with two distinct classes of electrical machines, *viz.*:—(*a*) Low-speed waterwheel generators of large diameter and weight; (*b*) high-speed turbo-alternator rotors of great length and medium diameter and weight; whilst the apparatus provided is also suitable for testing turbine rotor disks and similar apparatus which, although of light weight, necessitates the use of very high speeds. The internal dimensions are large enough to take rotors up to 14 ft. 6 in. diameter, and shafts up to 40 ft. in length. The walls are 9 ft. 6 in. in thickness, and consist of an outer casing of reinforced concrete with internal air pockets, linings of bags of sand, and rafts of timber held in place by a light steel framework. Taking advantage of lessons learned during the war in the construction of shell-resisting structures, the composite walls are designed to take out the sting of impact by bringing the flying parts to rest gradually. In the construction of the building 800 cubic yards of concrete, 30 tons of steel, 2,000 cubic feet of timber, and 7,000 cubic feet of sand were used, exclusive of the moving door, which consists of ferro-concrete lined with wood, carried on spring-mounted wheels, and weighs 17 tons. Loads of 120 tons can be handled; two special bogies, mounted on a standard heavy-gauge railway track, are provided to carry the rotors to be tested. A 500-volt d.c. motor of 1,800 h.p. is mounted in a separate chamber, together with a gear box arranged to impart speeds of from 250 to 7,200 r.p.m. on the driven shaft; provision has also been made for obtaining speeds up to 21,600 r.p.m. The coupling shaft between the gear box and the rotor to be tested has been designed to sever in the case of any serious disturbance during a test, thus acting as a safety device to save the gear box from damage. The coupling used at the test-pit end is of the large-diaphragm type, which allows for slight misalignment and damps out the transmission of vibration. A high-pressure oil system provides for lifting the rotors on to an oil film to reduce the starting effort required, besides lubrication. In a separate cabin in the main shop complete control is centred, and data can be recorded under quiet and convenient conditions.

Australian Standard Voltages.

The Australian Commonwealth Engineering Standards Association has issued a tentative Australian standard for voltages and frequencies for new systems and installations. According to the *Electrical Engineer for Australia and New Zealand*, for d.c. systems the standard l.p. voltages are 460 and 230, and for a.c. systems the standards are 230 V between phase and neutral and 400 V between phases. The station voltages are in each case 10 per cent. higher. The h.p. delivered voltages are 2,000, 6,000, 10,000, 20,000, 30,000, 40,000, 60,000, 80,000, 100,000, and 120,000, with station voltages 10 per cent. higher. The 2,000-V pressure is only to be used in systems other than public supply systems and where special circumstances warrant the adoption of voltages lower than 6,000. The standard frequency is 50 cycles, provided that a frequency of 25 cycles may be used for special industries for which it has advantages. This specification is numbered C1 (*a* and *b*)—1926T. It is issued tentatively for a period of 12 months.

The Moscow Radio Station.

The newly-built "Great Komintern" radio broadcasting station in Moscow, Russia, for the construction of which Prof. Bonch Brouevitch was responsible, was recently officially opened. The plant is claimed to have a capacity of 40 kW, and the accompanying illustration is of interest inasmuch as it shows the unusual type of aerial mast that has been adopted. The station now under construction at Zeesen, near Berlin,

"Great Komintern" Aerial Mast.

in Germany, is credited with the possession of the tallest masts in Europe; they are of the rectangular lattice steel pattern, their height being 210 metres.

Rural Supply Deputation.

On April 13th a deputation of members of Parliament, introduced by Sir Douglas Newton, waited upon Sir Harry Haward at the offices of the Electricity Commissioners to express disappointment at the delay which is taking place in providing rural areas with electricity, particularly with regard to the difficulties met with in obtaining wayleaves. It was suggested that more power should be given to supply undertakings to deal with the "final objectors," who were not always the landowners, who often raised trivial objections, but sometimes the Post Office, the railway companies, and even other Government departments. It was pointed out that as much as £200 was often spent in obtaining a landowner's consent for a supply line to be run over his land. The high costs of erecting h.p. lines were also stressed, and it was asserted that these

varied from £1,200 to £1,300 per mile. The deputation also urged that more publicity should be given to the fact that it was not practicable to use buried cables for many of the transmission schemes. The inhabitants of rural areas did not realise that there was a real necessity for overhead lines, and also thought that such lines could be diverted to suit their own conveniences without serious consequences. It was suggested that a memorandum should be issued for the guidance of local authorities and the general public concerned, explaining the new legislation. This should contain a short concise statement of facts calculated to dissuade possible objectors from entering into unnecessary legal proceedings. It was proposed that it should be made clear that it would not be possible to tap the new "grid" at any point where any prospective consumer might want a supply. It was not generally realised that it would be necessary to provide subsidiary overhead systems for the various areas. The Commissioners were also urged to compile an approved schedule of reasonable pole rentals and to make it clear that no sanction could be given for excessive charges. The schedule should be prepared on the basis of the sizes of the poles, the necessary trenching of the cables, the different types of land and crossings, and the methods of erection employed.

Electrical Association for Women.

The second annual general meeting of the above Association will this year take the form of a two-days' conference in London on May 11th and 12th next. The first day's proceedings will include the business meeting and a luncheon at the Hotel Cecil. On the second day visits will be made to the works of Standard Telephones & Cables, Ltd., Woolwich, and to the Woolwich Housing Estate.

Manchester Steam Users' Association.

The memorandum by the chief engineer of the Manchester Steam Users' Association, Mr. C. E. Stromeyer, O.B.E., M.Inst.C.E., for the year 1926, has just been issued. It contains much valuable information concerning boiler failures, and many examples are given of curious cases taken from the Association's museum. Great importance is attached to corrosion, prominence being given to uniform wasting, the most misleading and dangerous form to be met with in boilers. Instances are illustrated of the substance of plates, seams, rivets and stays having been slowly eaten away while the original shape has remained to mislead the inexperienced. Instances of corrosion at the overlapping of boiler plates show that where corrosion has removed about two-thirds of the plate thickness, and an equal amount from the rivet heads, the corners of the lap have remained sharp, but the hollow corners of the lap and the rivet heads have experienced partial protection and become rounded, a distinctive feature of this form of corrosion. It appears that sulphur dioxide does not attack cold steel, but when part of a furnace becomes overheated, due to scale or deposit, the metal is readily attacked by the gas.

An instance is quoted of a furnace ring collapsing as a result of uniform wasting. The cause was never revealed, but it is suggested that had the possibility of the trouble being brought about by thermo-electric currents presented itself at the time, the cause might have been found. It is shown that if a circuit can be established from one side of the plate, through the water and another part of the boiler and back to the starting point, weak but uniform corrosion is likely to occur.

A case of corrosion of the sides of a Lancashire boiler furnace, where the crossbar supporting the brick bridge was resting on the furnace sides, and not on angle brackets, supports the view that some forms of corrosion are due to certain strains having the power of making steel susceptible to corrosion attack.

It is recommended that cast-iron feed pipes and valves should not be fitted to boilers, as cast-iron is liable to graphitic corrosion. Referring to the corrosion found on the plates of the steam spaces of boilers, it is pointed out that now that the discovery has been made that steel creeps if overheated, the possibility of this form of corrosion being associated with creep or heat-straining should not be overlooked. The prevalence of incrustation in economiser pipes is evidenced by some illustrated examples. In one case the pipe shows a crack which occurred after removal, due to the swelling of the scale. A curious furnace-tube fracture of a l.p. boiler is illustrated. An internal bulge was created, and the scale on the tube exterior remained intact, being sufficiently porous to allow the steam to pass through it. Some useful data are given concerning steel failures with varying nitrogen and phosphorus contents, and where caustic soda had been introduced. Considerable information is also given with regard to the study of fatigue phenomena. Something of the early research work of the Association is also given, including descriptions of some of the early instruments employed.

Appointments Vacant.

Travelling meter engineer for the Electrical Apparatus Co., Ltd. Plumber-jointers for the Prestatyn U.D.C. Electricity Department. Meter mechanic (69s.) for the Darwen Corporation Electricity Department. Charge engineer for Doncaster County Borough Electricity Department. Assistant mains engineer (£366) for the Walthamstow U.D.C. Electricity Department. (See our advertisement pages to-day.)

Institution Notes.

Institution of Electrical Engineers.

Scottish Students' Section.—The following office bearers for the 1927-28 session have been appointed:—*Chairman*: Mr. J. Eccles; *Vice-Chairman*: Mr. A. Calder; *Hon. Secretary*: Mr. J. G. Boyne; *Members of Committee*: Messrs. J. A. Butters, T. Donaldson, A. Moir, and M. G. Say. The two remaining members of committee, one representative each from Glasgow University and the Royal Technical College, will be elected at the commencement of next session.

Junior Institution of Engineers.

At a meeting of the above Institution, on April 8th, a lecture and demonstration was given by Mr. E. Ambrose, M.I.E.E., on the subject of "Electrical Osmosis." The lecturer said that osmosis was closely related with dialysis and might be defined as "the tendency of fluids to mix or become equally diffused when in contact, even through an intervening membrane or porous structure." If a diaphragm were placed in a cell so as to divide it into two portions, each portion containing, say, acidulated water, and a current of electricity were passed through the diaphragm, then the liquid in one side of the cell would increase, showing that the water passed through the diaphragm. The phenomenon was electrical osmosis. Mr. Ambrose said that electrical osmosis was ever present in connection with rubber and fabric insulated conductors that were carrying d.c., any moisture being driven through to the copper of the negative. The dewatering of substances by electrical osmosis had been tried to a large extent in Germany. There was also a process for extracting sugar from beet, and for dewatering and purifying clays. There seemed to be much scope for the use of electro-osmotic action, as it had been demonstrated that liquids bearing narcotics or drugs could be forced through living skin and membrane by an electric current.

Iron and Steel Institute.

The annual meeting of the Institute is to be held this year on May 5th and 6th, at the Institution of Civil Engineers, when a large number of papers will be read. The annual dinner will be held at the Connaught Rooms, Great Queen Street, on May 5th. The autumn meeting will be held at Glasgow on September 20th to 23rd, at the invitation of the West of Scotland Iron and Steel Institute.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.

Torquay Corporation has appointed Mr. T. W. Mackay, B.Sc., A.M.I.E.E., construction superintendent to Messrs. Balfour, Beatty & Co., Ltd., for the Llanelly district, to the position of distribution engineer.

The Hastings Town Council has appointed Mr. C. Barratt, of Bradford, as salesman at the electrical showrooms at a commencing salary of £200 a year. There were 171 applications.

Upon the completion of the reconstruction of a large section of the Newcastle-Carlisle main road recently, Mr. A. C. Rayment, A.M.I.E.E., was presented by the men engaged upon the work with a case of pipes, a pouch, and an illuminated testimonial.

Mr. Henry Adam, electrical engineer and manager to Annfield Plain Urban District Council for the past seven years, has been appointed clerk of works and subsequent resident electrical engineer in connection with the Seaham Harbour electricity scheme.

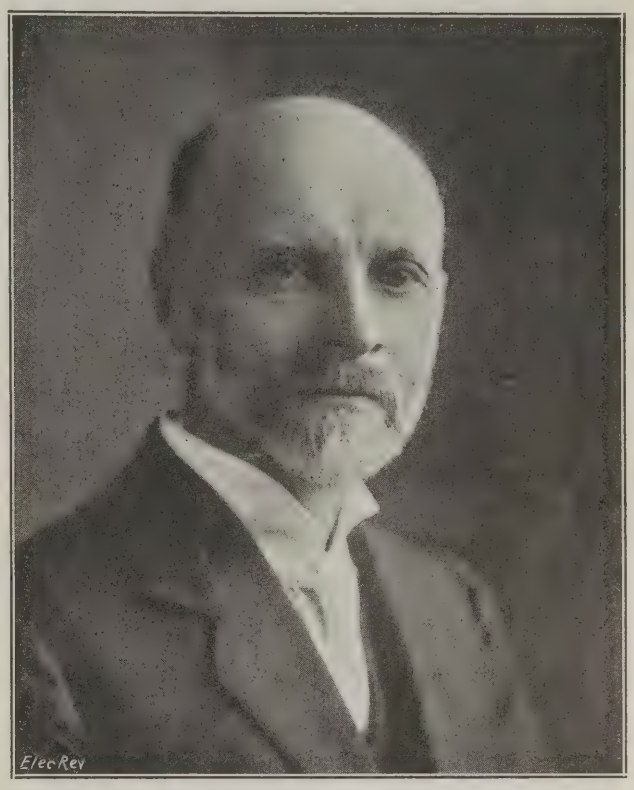
Mr. Breadmore, inspector on the staff of the Reading Corporation Tramways, has retired after nearly 50 years' service with the undertaking.

On accepting an important appointment on the engineering staff of the Central Electricity Board, Mr. C. W. Marshall, M.I.E.E., has resigned the position of chief technical assistant in the Glasgow Corporation Electricity Department. Mr. Marshall joined the staff of the Department over 14 years ago, and has held the position of chief technical assistant since 1916. He has made a special study of the most modern methods of generation, transmission, and distribution of electrical energy over wide areas, both in this country and on the Continent. In addition to articles contributed to our pages, books from his pen have been published dealing with the modern generating stations, protective gear, and electric battery vehicles. Mr. Marshall takes up his new appointment early in May

The Rev. L. Van Vestraut, M.A., who has for several years been chief assistant in the Testing Department at Faraday House Electrical Engineering College, has been appointed registrar. Mr. F. A. Bell, F.C.A., has been appointed secretary.

Mr. C. R. Westlake, of the Yorkshire Electric Power Co., has been appointed district mains engineer to the Bedford Corporation Electricity Department.

Mr. John Pendreich has resigned his position with Messrs. Wood & Cairns, Ltd., Edinburgh, and has started as a manufacturers' agent at 73, Saughtonhall Drive, Edinburgh.



Obituary.—Lt.-Col. Patrick Walter d'Alton.—We regret to announce that on April 10th Lieut.-Col. P. W. d'Alton died at Westcliff, aged 71. Col. d'Alton, who was a member of the Civil, Mechanical, and Electrical Engineering Institutions, was educated at Dublin University and King's College, London, and first tried his hand at civil engineering, but speedily turned to the mechanical branch, and served his pupilage at the Reading Ironworks. After further experience gained at the North-Eastern Marine Engineering Works and Messrs. R. & W. Hawthorn's Works, he went to sea and eventually acquired the Board of Trade's certificate as chief engineer. In 1886 he became chief engineer to the Nordenfeldt Submarine Boat Company, but in 1889 he entered the electrical industry, as resident engineer in the Deptford power station of the London Electric Supply Corporation, and two years later he succeeded Mr. Ferranti as engineer-in-chief. During the South African war he served as major in the 6th Battalion, Royal Irish Rifles; afterwards he was appointed chief engineer to the Central London Railway, and from 1903 to 1914 he was chief mechanical engineer to Messrs. Dick, Kerr & Co., Ltd., in which capacity he carried out the conversion of the Liverpool-Southport Railway to electrical operation, and visited various parts of the world.

He took up private practice in 1914, but was chief engineer to the Valuation Committee from 1916 to 1921, with the rank of lieut.-colonel, and was responsible for advising the Ministry of Munitions and the Board of Inland Revenue on commercial questions arising out of the war. Afterwards he resumed his private practice. A man of striking personality, he was immensely popular, and was widely known in the engineering world, in which his undoubted ability made him an outstanding figure.

Mr. M. MacLeod.—The death took place at Rawmarsh on April 8th of Mr. Murdo MacLeod, who for 20 years had been traffic superintendent of the Mexborough and Swinton Tramways Co.

Capt. Reginald John Wallis-Jones.—On April 16th Capt. R. J. Wallis-Jones died, after a long illness; particulars of his career will be given in our next issue.

Mr. Albert Gay.—We have to record with regret the death, after a protracted illness, of Mr. Albert Gay, consulting and resident electrical engineer to the Islington Borough Council, at his home, on Tuesday, April 12th, at the age of 68 years. Mr. Gay was a native of Barnstaple, and entered the electrical field at the Lambeth works of the Anglo-American Brush Electric Light Company; in 1881 he joined Hammond & Co. as installation engineer, but from 1884 to 1887 he was in business on his own account. Subsequently Mr. Gay acted as chief engineer to the Eastbourne, Brighton, and House-to-House Companies in turn, before, in 1894, he was commissioned by the Islington Vestry to design and construct electricity works for the parish and to take charge of the undertaking; in that capacity he continued, under the Borough Council, until his death—a period of nearly 33 years. Mr. Gay was a member of the Institution of Electrical Engineers, and a past-president of the Associated Municipal Electrical Engineers; in conjunction with Mr. C. H. Yeaman he wrote a book, "Central Station Electricity Supply," which for many years had the field to itself, and he took an active part in literary and technical work. One of the pioneers of electricity supply in London, he was latterly a redoubtable opponent of the policy of the Electricity Commissioners with regard to the closing of the older and less efficient municipal generating stations.

Elliott & Fry] [*London.*

The late Mr. Albert Gay.

Will.—Mr. Stewart M. Banker, late superintending electrical engineer, G.P.O., left £3,167 gross and £1,094 net personalty.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Siderman Electrical Supplies, Ltd.—Private company. Registered April 9th. Capital, £1.000 in £1 shares. To carry on the business of manufacturers, importers and exporters of and wholesale and retail dealers in electric lamps, electrical accessories, electric cables, &c. The first directors are:—A. Siderman, 51, Cleveland Street, Fitzroy Square, W., electrical factor; N. A. L. Stilling, 25a, Westbourne Terrace, Bayswater, W. Qualification, 10 shares. Solicitors: Hugh M. Everard & Co., 28, Maddox Street, W. Registered office: Goodwyn House, 4, Fitzroy Square, W.

Electric Agencies, Ltd.—Private company. Registered April 14th. Capital, £2.000 in £1 shares. Objects: To carry on the business of manufacturers and repairers of and dealers in automobiles, motor-cars, cycles, bicycles, aeroplanes, dynamos, accumulators, lamps, machinery, &c. The subscribers are:—S. F. Parish, 12, University Place, Cardiff, sales manager; L. J. Victor, 53, Grosvenor Street, Cardiff, builder. The first directors are to be appointed by the subscribers. Qualification, 100 shares. Secretary: I. G. Smalldridge. Registered office: 45, Caroline Street, Cardiff.

R.I. and Varley, Ltd.—Private company. Registered April 14th. Capital, £500 in 1s. shares. Objects: To carry on the business of selling agents for wireless, electrical, mechanical and other instruments, &c. The directors are:—J. Joseph, 12, Hyde Street, W.C.1; J. M. G. Rees, Cambridge Place, Burrage Road, Woolwich, S.E.18. Solicitors: Garton & Co., 21, Maddox Street, W.

Elektromekano Co. (London), Ltd.—Private company. Registered April 13th. Capital, £100 in 1s. shares. Objects: To carry on business as merchants and agents for the sale of all types of electrical machinery, apparatus and accessories, &c. The directors are:—K. A. Malmberg, 48, Copers Cope Road, Beckenham; S. G. Clarke, 59, Lavender Vale, Wallington, merchants' manager (both directors of K. Malmberg, Ltd.). Qualification, £1. Secretary: S. G. Clarke. Solicitors: Keene & Co., 15, Seething Lane, E.C.3. Registered office: 110, Cannon Street, E.C.4.

Power Lines Construction Co., Ltd.—Private company. Registered April 11th. Capital, £10,000 in £1 shares. Objects: To carry on the business of constructors of and dealers in cables, wires, lines, stations, accumulators, lamps, meters, works and engines for the purposes of supplying electricity for motive power, light, heat, &c. The first directors are:—H. H. E. Wood, 27, Onslow Avenue Mansions, Richmond, Surrey; C. W. Bloomfield, 6, Stanhope Court, Stanhope Place, W. Secretary: H. H. E. Wood. Solicitors: Frank Simmonds & Carter, 98, Salisbury House, E.C.2. Registered office: Palace House, Bridge Street, S.W.1.

N.S. Accumulators, Ltd.—Private company. Registered April 13th. Capital, £6,000 in £1 shares. Objects: To acquire the business of manufacturers of N.S. accumulators now carried on as "Bulley & Forbes," at 30, Lomond Grove, Camberwell, by W. R. V. Forbes and T. J. Bulley. The permanent directors are:—W. R. V. Forbes (chairman), Victoria Mansions, 28, Victoria Street, S.W.1; T. J. Bulley, 201, Devonshire Road, Honor Oak Park, S.E.23; G. A. Houghton, 49, Blessington Road, Lewisham, S.E.13. Qualification, £100 shares. Solicitors: Sir Henry C. Eggar, 164, Winchester House, E.C. Registered office: 30, Lomond Grove, Camberwell, S.E.5.

C.C.A. (Vacuum Cleaners), Ltd.—Private company. Registered April 13th. Capital, £3,000 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in vacuum cleaners, electrical implements, appliances, installations, labour-saving devices, machinery, and hardware of all kinds, &c. The subscribers (each with one share) are:—A. W. Rowoldt, 83, Queen Street, E.C.4, merchant; P. Hayter, 83, Queen Street, E.C.4, merchant; T. A. Blow, 83, Queen Street, E.C.4, cashier. The first directors are to be appointed by the subscribers. Qualification, one share. Solicitors: Cruesemann & Rouse, 40-42, King William Street, E.C.4.

Official Returns of Electrical Companies.

Goswell Engineering Co., Ltd.—R. G. Pye, C.A., of 6, Martin Lane, E.C., was appointed receiver on March 29th, 1927, under powers contained in debenture dated July 14th, 1926.

Thermionics, Ltd. (formerly G. W. I. Valves, Ltd.).—Capital, £150 in 1s. shares. Return dated December 31st, 1926 (filed February 9th, 1927). All shares taken up. £150 paid. Mortgages and charges, £1,000. L. A. Bartlett, of 639, Salisbury House, E.C.2, was appointed receiver and manager on July 16th, 1925, and was still acting as such on January 15th, 1927.

Trent Electric Wire Works, Ltd.—Capital, £2,500 in £1 shares. Return dated December 31st, 1926. All shares taken up. £1,500 paid. £1,000 considered as paid. Mortgages and charges, £1,000.

British Radio Corporation, Ltd.—Capital, £2,000 in 1,000 preference and 1,000 ordinary shares of £1 each. Return dated February 28th, 1927. 870 ordinary shares taken up. £650 paid. £220 considered as paid. Mortgages and charges, nil.

Yorkshire Electric Transformer Co., Ltd.—Capital, £5,000 in £1 shares. Return dated December 31st, 1926 (filed March 21st, 1927). 3,530 shares taken up. £3,530 paid. Mortgages and charges, nil.

Galliers (Wholesale), Ltd.—Capital, £1,000 in £1 shares. Return dated December 31st, 1926 (filed March 25th, 1927). 100 shares taken up. £1 per share called up on each. £100 unpaid. Mortgages and charges, nil.

William J. Hook & Co., Ltd.—Capital, £1,000 in 500 preference and 500 ordinary shares of £1 each. Return dated December 16th, 1926. 400 preference and 3 ordinary shares taken up. £403 paid. Mortgages and charges, nil.

Morris Electrical Co., Ltd.—Capital, £1,000 in 400 preference and 600 ordinary shares of £1 each. Return dated December 31st, 1926 (filed January 29th, 1927). 25 preference and 402 ordinary shares taken up. £177 paid. £250 considered as paid. Mortgages and charges, £200.

G. L. Electrical Supply Co., Ltd.—Capital, £1,000 in £1 shares. Return dated December 31st, 1926. All shares taken up. Nil called up on 2 shares. £998 considered as paid. Mortgages and charges, nil.

Unity Lamp and Accessories, Ltd.—Capital, £2,000 in £1 shares. Return dated May 25th (filed December 10th), 1926. 1,900 shares taken up. £1,187 10s. paid (being 12s. 6d. per share on each). Mortgages and charges, nil.

C. F. Palmer (London), Ltd.—Land Registration charge on 63a, Effra Road, and land in rear of 63-5-7, Effra Road, Brixton, dated March 28th, 1927, to secure all moneys due or to become due from the company to Barclay's Bank, Ltd.

Woking Electric Supply Co., Ltd.—Issue on March 3rd, 1927, of £700 debentures, part of a series already registered.

Electric Construction Co., Ltd.—Satisfaction to the further extent of £4,740 on March 31st, 1927, of 4 per cent. perpetual first mortgage debenture stock secured by trust deed dated December 16th, 1897, securing £200,000.

Plessey Co., Ltd.—Debenture charged on property in Vicarage Lane, Ilford, and the company's undertaking and property, present and future, including uncalled capital, dated March 16th, 1927, to secure all moneys due or to become due from the company to Lloyd's Bank, Ltd.

Howarth, Green & Co., Ltd.—Particulars filed of £2,000 debentures authorised March 25th, 1927, charged on the company's property, present and future, including uncalled capital, the whole amount being now issued.

Bromley (Kent) Electric Light and Power Co., Ltd.—Satisfaction in full on or before March 15th, 1927, of debenture stock dated July 7th, 1902, and June 6th, 1904, securing £70,000.

J. Marse & Co., Ltd.—C. W. J. Mason, of 41, Finsbury Square, E.C.2, ceased to act as receiver or manager on March 5th, 1927.

C. F. Elwell, Ltd.—A. White, of 34, Norfolk Street, W.C.2, was appointed receiver on April 1st, 1927, under powers contained in debentures dated June 3rd and 30th, and October 29th, 1921.

Geoffrey Boulding, Ltd.—E. C. Williams, of 107a, Mortimer Street, Herne Bay, was appointed receiver and manager on March 23rd, 1927, under powers contained in debenture dated March 29th, 1926.

City Notes.

Montevideo Telephone Co., Ltd.

It was recently reported that an offer of £2 for each of this company's shares had been made, but no mention was made of the source of the offer. The *Financial Times* now reveals that the prospective purchaser is the International Telephone and Telegraph Corporation of New York. This concern, which has a total capital of over sixty million dollars, has a number of interests in America and Europe, including Standard Telephones & Cables, Ltd. In 1925 it acquired an agreement with the Uruguayan Government for the construction of an underground telephone system in Montevideo at a cost of about $5,500,000. The completion of this system would give the Government a monopoly of the city's telephone business. Apparently the Government is unable to find the money, and our contemporary infers that the purchase by the New York concern of the Montevideo Telephone Co.'s business is due to an apprehension that the latter might secure a fresh concession. It is pointed out that the installation of modern plant will involve an expenditure of about £2,000,000. The *Financial Times* believes that the majority of the shareholders have already accepted the offer. It is announced that Mr. J. G. le Marchant has resigned from the board, and that his place has been taken by Mr. H. M. Pease.

South Wales Electrical Power Distribution Co.

The directors of this (Parliamentary) company announce that, in spite of the adverse conditions of the past year, there was a gross profit of £89,069 for the last year. After meeting the debenture interest and preference dividend, it is proposed to transfer the balance (£18,743) to the depreciation reserve, making £149,858. The South Wales Power Co., Ltd., reports a total income from the Distribution Company's and other securities of £59,362, to which is added £8,441 brought forward, making £67,803. After meeting debenture interest, preference dividend, &c., there remains a balance of £10,990, which is to be carried forward. The report states that conditions during the year prevented the company from reaping the benefit which would have accrued from the full use of the new plant. An extraordinary meeting is to be held on April 26th for the purpose of considering resolutions raising the Power Company's capital by £250,000 to £1,100,000.

Northern General Transport Co., Ltd.

The net revenue for the year was £75,620, and after providing for loan and debenture interest, renewals, &c., there remains £34,099, to which is added £7,112 brought forward, making £41,211. The dividend on the ordinary shares is 7 per cent. (of which 2½ per cent. has already been paid), and £2,440 is carried forward. During the year £51,101 was spent on capital account. The nominal values of the company's investments at December 31st last were as follows:—Gateshead and District Tramways Co., £278,410; Tynemouth and District Electric Traction Co., Ltd., £58,205; and Jarrow and District Electric Traction Co., Ltd., £59,598. These stand at a cost of £420,141. In May last an issue of 118,750 £1 ordinary shares was made at par. The meeting was to be held yesterday (Thursday).

Brompton and Kensington Electricity Supply Co., Ltd.

The report for 1926 states that since January 1st of that year the company has purchased its electricity from the London Power Co., Ltd., to which the generating station has been leased. During the year £58,466 of the reserves was capitalised and distributed as ordinary shares to existing holders of ordinary shares in the ratio of one new share for each five held. The amount of energy sold rose from 6,553,067 kWh to 6,867,875 kWh. After providing the statutory amounts for the sinking and contingency funds the net revenue is £50,288, and after paying the preference and standard ordinary dividends, a balance of £19,496 is carried forward. Meeting: April 28th.

Rhondda Tramways Co., Ltd.

The accounts for the past year show a net loss of £19,148, after providing for an operating loss of £4,924, interest, rent, &c. From this is deducted a balance of £4,283 brought forward, leaving a deficit of £14,866 to be carried to the next account. The district served is purely a mining one, and business was naturally seriously affected by the coal dispute and general strike. Since the end of the dispute receipts have been gradually improving, but some time will elapse before normality is reached. The report states that the engineer and manager, Mr. Holliday, died in June last; Mr. T. G. Richardson, late general manager of the Hartlepool Tramways, has been appointed to the position.

Western Union Telegraph Co.

The income account for 1926 shows a gross operating revenue of $134,464,886, and a balance transferred to surplus account of $15,205,049. The latter account shows a total surplus of $80,173,160, from which are deducted adjustment of surplus (net) $788,417 and dividends $7,980,700, leaving a surplus at December 31st of $71,404,042. During the year the company's authorised capital was increased from $100 to $105 millions, and an increase of $25 millions in the bonded indebtedness was authorised. At the end of the year the system comprised 213,637 miles of pole lines; 3,324 miles of landline cables; 28,821 nautical miles of ocean cables; and 24,688 telegraph offices.

Bombay Electric Supply and Tramways Co., Ltd.

The report for 1926 shows that the total revenue for the year was Rs.150 lakhs and the total expenditure Rs.80 lakhs, leaving a gross surplus of Rs.70 lakhs. After deducting depreciation, interest, &c., there remains a net profit of Rs.48 lakhs for distribution as dividends. Dividends of 7 per cent. on the cumulative preference shares and 14 per cent. on the ordinary shares have been declared. The company has decided to open at its head office in Bombay a showroom where the best means of utilising electricity for lighting, power, and cooking will be demonstrated.

Canadian General Electric Co.

After providing for reserves, taxation, and depreciation, the net profit for 1926 is $1,170,618, as compared with $933,751 in 1925. There are no loans or debentures; the preference dividend (7 per cent.) absorbed $599,042. A great amount of obsolete equipment has been written off, requiring the whole of the depreciation reserves and utilising part of the year's balance. The outlook for the current year is said to be good, both in the heavy machinery and small supplies departments.

Electric Supply Corporation, Ltd.

The gross earnings for 1926 were £103,966 and the net profit was £42,357 (against £46,977). The ordinary dividend and bonus is maintained at 11 per cent., £3,000 is transferred to general reserve, and £10,110 to depreciation fund, £1,000 is written off underwriting commission on preference share issue, and a balance of £5,101 is carried forward. At the meeting on April 25th a resolution providing for the raising of the capital from £350,000 to £500,000 will be submitted.

Foundation Co., Ltd.

Last week this company issued, for information only, particulars of £150,000 of 6½ per cent. secured bearer notes redeemable at par on December 31st, 1929, the issue of which was sanctioned on April 11th. The notes will be secured as a floating charge on the undertaking and property of the company present and future, and the proceeds will be utilised for meeting capital expenditure incurred in the general expansion of the business.

Direct Spanish Telegraph Co., Ltd.

The balance of profit for the past year, including £1,213 brought forward, was £10,366. After paying the preference dividend and one of 10 per cent., free of tax, on the ordinary shares, £900 remains to be carried forward. The traffic receipts show a decrease of £446 as compared with the previous year. The company's cables worked without interruption during 1926. Meeting: May 3rd.

Electrical Distribution of Yorkshire, Ltd.

The directors announce that the issue of 300,000 £1 ordinary shares to existing shareholders in proportion to their holdings has been very successful. The applications for additional shares (apparently those not taken up by shareholders) represent double the amount available.

Wycombe (Borough) Electric Light and Power Co., Ltd.

After providing for all expenses, including debenture interest, preference dividends, &c., and crediting the balance brought forward, the net profit for 1926 was £13,222. An interim ordinary dividend of 4 per cent., free of tax, was paid, and it is proposed to distribute a further 6 per cent., free of tax, to transfer £4,000 to general reserve, and £500 to superannuation provision account, leaving £1,222 to be carried forward. To meet the increasing demand, additional generating plant, cables, &c., have been installed, and since the end of the year 3,000 ordinary shares have been issued. The original plant has been removed. Mr. F. E. Gripper has resigned the position of chairman through ill-health, and his place has been taken by Mr. A. N. Rye, while Mr. C. H. Jones has been elected a director.

Madras Electric Tramways (1904), Ltd.

The gross profit for the past year was £21,628 and the net profit £5,650 (against £14,392). To this is added £7,516 brought forward, making £13,166. The preference dividends are paid, and a balance of £7,166 is carried forward. For 1925 the ordinary dividend was 6 per cent. The decline in the profit is attributed to competition.

Chelsea Electricity Supply Co., Ltd.

The directors' report for the past year records a net profit of £41,997, after providing for debenture interest and the statutory amounts for the sinking and contingency funds. The preference and standard ordinary dividends are paid, and a balance of £5,097 is carried forward. The connected load rose from 12,159 kW to 12,747 kW, and the sales of energy from 7,092,550 kWh to 7,746,878 kWh. The meeting is to be held on April 28th.

The Great Northern Telegraph Co., Ltd., of Denmark.

The directors propose to distribute a total dividend and bonus of 20 per cent., including the 5 per cent. already paid, for the year 1926, and to transfer £20,000 to the reserve and renewal fund, while £37,500 has been allotted to the pension fund. £192,624 is carried forward.

Anglo-American Telegraph Co., Ltd.

A dividend of 15s. per cent. has been declared on the ordinary stock and one of £1 10s. per cent. on the preferred stock for the quarter ended March 31st. The rates are the same as a year ago.

Lisbon Electric Tramways Co., Ltd.

The balance of arrears of preference dividend is being paid and at the same time an interim dividend of 3 per cent. net has been declared on the ordinary shares. The last payment of ordinary dividend was 4½ per cent. in respect of 1915.

Simms Motor Units, Ltd.

Out of a net profit of £30,565 for 1926 the company is paying a dividend of 12½ per cent. (against 10 per cent.), of which 4½ per cent. has been paid, transferring £10,000 to reserve (against *nil* last year), and carrying forward £33,173.

Dutch Company.

The Amsterdam correspondent of the *Financial Times* reports that the *Netherlands Cable Factories* has declared a dividend of 24 per cent. for 1926, as against 21 per cent. for the previous year.

Herbert Morris, Ltd.

A dividend at the rate of 7½ per cent. per annum has been declared on the ordinary shares for the six months ended January 31st last.

Marconi International Marine Communication Co., Ltd.

The directors recommend a final dividend of 5 per cent., making 8¾ per cent. for the year, as against 7½ per cent. for 1925.

Joseph Lucas, Ltd.

An interim dividend of 5 per cent. has been declared on the ordinary shares.

Erinoid, Ltd.

It is proposed to pay an interim dividend of 3 per cent., as compared with 4 per cent. last year.

Brazilian Traction, Light and Power Co., Ltd.

A quarterly dividend of 1½ per cent. has been declared on the ordinary stock, as against 1½ per cent. last year.

Stocks and Shares.

Tuesday Evening.

Easter holidays and the Budget being comfortably out of the way, Stock Exchange markets have no valid excuse, save that of China, for being otherwise than animated and cheerful. The Budget, so far from being a drag upon prices, is a bull point. No increase in income-tax, no raid upon the Sinking Fund, no oppressive taxes upon industry—these are

three negative consolations of active interest. They make for confidence amongst investors. They encourage a feeling of hopefulness in regard to the trade outlook: a general rise in iron and steel shares is testimony to the cheery prospect which speculators consider to open in front of the heavy trades of the country.

Babcock & Wilcox rose another 1/16th to 55s. on the figures in the report, which is considered very satisfactory in view of the trade conditions that prevailed during the period covered by the accounts. There is a greater disposition, shown in various directions, to regard with favour the shares in manufacturing companies. Siemens, for example, are better than the nominal price suggests, there being buyers about at the middle figure. British Aluminium ordinary regained the 9d. lost in the previous week. A fall of 10s. in Telegraph Constructions draws attention to the low yield afforded by the shares. The only reason why proprietors accept so slender a return is the hope of the Board declaring a bonus, which hope has buoyed the price for years past, but which seems as far off as ever from fulfilment.

Eastern Extensions are ½ up at 17½, this being the only change in their group. Marconis are fluctuating between 17s. 6d. and 18s. Although the opposition to the reorganisation plan is stilled for the time being, the objectors are but waiting for the resolutions to come before the Court, when the protests are to be raised again. In the Stock Exchange the assumption is general that the scheme will go through, and that the capital reduction, &c., will be duly carried out. Burndept preferred are flat at half-a-crown.

Reference was made here three weeks ago to the statement on the subject of Beam developments by the president of the important American concern known as Mackay Companies. In that statement, naturally, not wholly unbiased, he defined the Beam radio as a system using low power and short waves which, by means of suitable reflectors, are more or less concentrated into a converging beam directed towards the receiving apparatus. The older trans-ocean wireless systems use high power and long waves which are much less susceptible to efficient directional sending. The superiority of short waves over long waves, he declared, remains to be proved, and he quoted Dr. W. H. Eccles, president of the Institution of Electrical Engineers, as saying that a commercial (radio) firm competing with cables would find long waves generally more trustworthy. The development of the high inductance, or so-called "loaded" cable, is a long forward step; general progress and improvement in recent years have been marked and important, even if lacking in spectacular appeal. A good deal is made, of course, of the ease with which "beam" radio can be picked up by anyone possessing the necessary equipment.

Technical testimony to the composure with which radio and wireless achievements can be regarded by holders of cable securities is of solid value. A dozen times during the past 25 years scares of greater or of less intensity have disturbed the cable companies' proprietors. Yet, in spite of the wonderful advance made by the newer systems, and the marvels which these can now accomplish, nothing has so far arisen to shake the so oft-repeated conviction that there is plenty of room for them all; that one is complementary, rather than antagonistic to the other, and that the Senior Service keeps abreast of modern requirements by linking wireless interests to those of the submarine cable. Marconi Marine proposes a dividend making 8¾ per cent. for last year, against 7½ per cent. for 1925.

Automatic Telephones remain dull, but Internationals rallied a trifle to 41s. 9d., and the deferred to 40s. 9d. Telephone Manufacturing are 7s. 3d.

Mexican Light and Power preferred are conspicuous with a rise of 7½ points, at 107, on the assumption that the scheme for dealing with dividend arrears stands upon the point of publication. According to market talk, the details of the plan are settled, but require one formal assent before the plan can be placed in front of the proprietors. Other Mexican issues are unchanged. Brazilian Tractions have gained 1½ points. The Anglo-Argentine Tramways group is steady. British Columbia Electric Railway preferred has put on 1, at 116½. The London railway and tramway descriptions are quiet, Underground £1 shares being 6d. up, at 16s. 6d., on the expectation that bumper traffics were secured at Easter.

Electric Supply shares are uninteresting, a decline to 59s. 6d. in Bournemouth and Poole being offset by a slight improvement in Metropolitan ordinary shares. Hope deferred possibly maketh sick the hearts of speculative investors who bought Bournemouth and Poole shares many months ago, believing that the company would be acquired by one of the corporations—Bournemouth being the more obvious. Alternatively, it was hinted that the company might make some kind of a bonus issue to its shareholders. But nothing more than gossip has resulted from these rumours.

India Rubber shares are a harder market at 20s. The readier disposition on the part of the public to buy iron and steel shares has already been noted. Rubber, as regards shares and produce, is tame, offering no interest or excitement. Business generally in the Stock Exchange is of the retail order. It is expected, and with good reason, that the Bank rate will be reduced in the near future. This, with the cheery effect produced by the Budget, is responsible for a strong tone in most of those Stock Exchange departments that look for their price-movements to the inspiration of money market considerations.

The Electrical Industry and Market.

The Influence of Other Trades and Industries.

THE second quarterly trade survey published by the British Electrical and Allied Manufacturers' Association (5s. net) is a study of the economic situation in the leading industrial countries, and an attempt to forecast future developments in which the electrical industry is not treated separately but as a section of the economic framework. The familiar broad aspects are restated, *e.g.*, the growth of productive power as a consequence of the war, increased protective tariffs, the reduction of national wealth in European countries, &c. To the coal dispute of last year is mainly attributed the fact that Germany is at the moment the only country which can point to improvement in industrial production. There are factors at work which will induce still greater reductions in the price of finished German goods to enable them to compete, but the competitive situation is not so favourable now, and trade will react at once. There are few indications of any growth of demand in the more important markets upon which the prosperity of Europe depends.

Dealing with the basic industries, the report urges the importance of coal, iron and steel to the electrical industry; over 40 per cent. of the industrial motors in Great Britain have been installed in these industries, and they may be the decisive factor in the expansion of the industrial branch of the electrical industry for a considerable time to come. With regard to the coal industry, it is pointed out that prices have not yet regained the pre-dispute level, and this is an important point in favour of electric power in industry; dear coal affects the price of electricity less than it affects the cost of production in non-electrified works. Complaint is made that the home industries are being unfairly treated to expand the exports of coal. The British iron and steel industry, when compared with the German industry, is said to be 700,000 h.p. of electric motors behind.

The official indices of the state of industrial production upon the 1913 basis are shown to be open to amendment; it is alleged that they have not taken full account of the changes in direction which have been made since then. It is stated, for instance, that while our exports of textile and agricultural machinery and machine tools outweighed all other branches of the industry until a few years ago, electrical machinery and apparatus, with steam turbines, boilers and condensing plant now come easily first, with automobiles second; agricultural machinery is near the bottom of the list. In many industries, of which electrical engineering is one, Germany has definitely lost ground as company with Great Britain. A study of the state of industrial activity leads to the conclusion that recovery from the effects of the coal stoppage has not been rapid enough. Coming to the electrical industry, the report deals with the effects of last year's troubles, but it is stated that the rate of expansion of electricity supply is now greater in this country than in the United States, Canada or Germany. Amalgamations in the coal and chemical industries are expected to lead to the wider adoption of electrical machinery, and the fact that only improved equipment can make the iron and steel industry able to compete is expected to lead to orders from this direction. Only financial difficulties, coupled with a certain amount of prejudice, have retarded electrification in the cotton industry. After remarking upon the high degree of industrial electrification in Germany, which is now greater than in the United States, the survey deals with the deficiencies of British industries. A table of estimated arrears for seven industries gives a total of 2,032,000 h.p. (including coal mining, &c., 800,000 h.p.; iron and steel, 700,000 h.p.; and cotton textiles, 500,000 h.p.). These industries are said to represent only 50 per cent. of the total, and it is therefore computed that the aggregate shortage is in the neighbourhood of 4,000,000 h.p., or about 70 per cent. of all the electric motors at present in operation. These statistics aim at illustrating the immensity of the field waiting to be cultivated by the electrical manufacturer, and at the same time the serious handicap under which he labours in his struggle against German and American competitors. The American manufacturer, with American industry employing 24,000,000 h.p. of electric motors, has four times the market, and the German manufacturer more than twice the market, open to the British manufacturer, who must suffer, in addition from the effects of unrestricted competition at home. The real disadvantage *vis-à-vis* the United States and Germany is about 6 : 1 and 3 : 1 respectively. While the Americans and Germans can embark upon large-scale production, the British manufacturer, forced to discover 30 per cent. of his market overseas, cannot standardise or specialise, and therefore mass production cannot be widely adopted.

The position in British industry itself, through its inability to adopt electrical machinery, threatens a crisis in production which can only be avoided through a policy of renewals and replacements and extensions of manufacturing plant of the most far-sighted and thorough nature. A national electrification policy is necessary to the realisation of sounder competitive conditions and the restoration of trade activity. In 1926 the electrical industry reported a record flow of orders; there are indications that a similar result will accrue this year, provided that progress is begun on the national power scheme. In the small industrial motor section, however, conditions were unsatisfactory through the inability of industry and transport to earn sufficient profits to justify the installation of electrical plant. The financial reconstruction undergone by a number of large industrial undertakings, with a resultant difficulty in raising new capital, is thought to be an adverse influence so far as the electrical industry is concerned. On the generating side the orders already received will give continuous employment for the rest of the year; on the heavy industrial side, coal-mining and steel orders are beginning to materialise, and may possibly reach a satisfactory total before the end of the year; but activity is less pronounced in the manufacture of cables. Great Britain maintained the position, gained in 1925, of chief supplier to the world's electrical market and held its ground in the first two months of 1927. A table shows that in the latter period exports amounted to £3,257,263, against £2,941,868 in January-February, 1926. Germany's exports increased from £2,778,500 to £2,781,050, and those of Switzerland from £299,130 to £338,290. The export position is satisfactory at the moment as a result of heavy orders placed by Australia, New Zealand, South Africa, India, Japan, Russia, and Argentina during 1926, while the restoration of normal exchange conditions in Europe has stimulated the demand for generating plant and switchgear. During the last three years Britain has held, and continues to hold, its own in generators, motors, convertors, and switchgear; in batteries and accumulators its position has improved; while in insulated wires and cables a fairly steady decline has taken place, Germany forcing out both Britain and the United States. In telegraph and telephone apparatus, excluding wire, a similar change in position has occurred. Germany and Switzerland supply the bulk of the world demand for meters, the share of Great Britain being less than 10 per cent.; and in lamps the competitive situation is equally unsatisfactory.

Since the beginning of the year a marked improvement has resulted in exports of insulated wire and cables, but a decline has occurred both in telegraph and telephone apparatus and lamps. In electrical machinery the upward movement in British exports continues, accompanied by a similar development in Switzerland, while a decline has occurred in the United States and Germany. As a part of its efforts to capture foreign trade, Germany has reduced the prices of its motors, and now with Switzerland and France is well below the British level. The difference in price is increasing presaging intensified competition. The cost of living in the competing countries tends to a common level, but it remains too high in Britain, and the gap between wholesale and retail prices must be reduced if labour troubles are to be avoided. The competitive position is full of uncertainty; stocks are low in the majority of industries, so that a lowering of prices can be operative at once, but there is a danger of destroying the real profit basis of production and seriously weakening the market. The position of the British electrical industry is fairly sound even at present price levels, since quality and efficiency of operation have decided the issues in almost every important contract, but the persistence of the downward movement in wholesale prices must react also on the British manufacturer and cause a narrowing in the available markets. The survey concludes with a general forecast of trade conditions. It is pointed out that while currency stability has been reached, this stability is due more to the deliberate policy of financiers than to a revival of international trade, which is still depressed. There has been over-production accompanied by restriction of credit. Although Germany has been active, there are indications of a downward movement. Uncertainty exists in international trade with a marked tendency towards depression. Britain and France have followed Germany in the "rationalisation" of industry, and are offering strong resistance to German penetration of foreign markets. The position of the British exporter is not reassuring, but conditions may improve later in the year. If the national reorganisation of electricity supply is proceeded with immediately, the electrical manufacturer may escape almost wholly from the trade depression. There is still a shortage of about 600,000 kW of generating plant to be made good. The export position is strong; for six years Britain has more than held her own, but this year will be the most difficult and most decisive of all. The growth of amalgamation and trustification continues in Britain as well as in Germany, with the result that already important orders have been secured for electrical equipment in the heavy industries.

Two appendices to the survey review the German electrical industry, and they are followed by a series of curves and diagrams dealing with many phases of industry.

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

A Suspended Globe Fitting.

With a view to preventing the constant breakages of electric-fitting glassware which occur in large stores and similar establishments, due to insecure methods of fastening, the General Electric Co., Ltd., Magnet House, Kingsway, W.C.2, has evolved a patent safety canopy fitting, which, it is claimed, entirely eliminates the possibility of dropping the globes, by means of a flexible incorrodible steel suspension wire which is securely attached to the supporting ring of the glass at two points and secured to a vertical winding drum in the crown of the fitting When it is desired to replace a lamp or clean the globe, the latter is released by means of a wing nut, when the drum will automatically unwind and lower the globe by means of the suspension wire, leaving both hands free to carry out the necessary work. To wind up, fig. 1, the canopy of the fitting, to which the drum is secured, is turned by one hand, the other being used to hold the gallery in position and act as a brake for the drum. The globe cannot, it is claimed, be left insecurely fixed, as unless the locking nut is screwed up, it will not stay in the closed position. The metal-work is of oxidised-copper finish, and the globe is of white low-absorption glass. The fitting is available in 14-in. and 16-in. diameter sizes, suitable for 100/150-W and 200-W lamps, respectively.

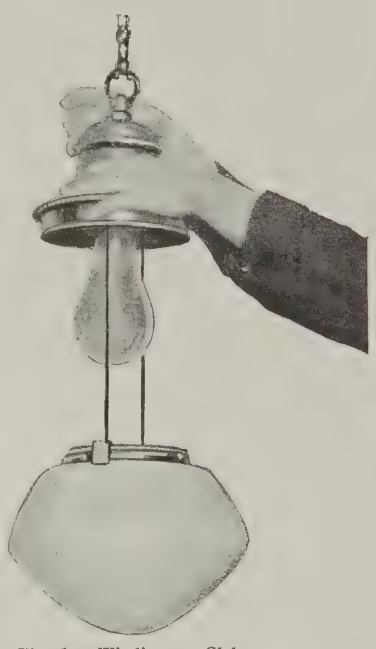

Fig. 1.—Winding-up Globe.

A Pole-Type Condenser.

The accompanying illustration, fig. 2, shows, in position, a l.p. pole-type condenser which is marketed by the Telegraph Condenser Co., Ltd., Southampton Street, High Holborn, London, W.C.1. The apparatus is intended for installation on the overhead transmission lines of distributing supply undertakings where bulk supplies are metered on kVA demand. In the case depicted the supply is distributed by 3,000-V lines, the pressure being transformed down by means of pole-type transformers. The condenser is connected direct to the transformer secondary, thus relieving the transformer itself of wattless current in addition to the overhead system generally. It is built into an outdoor type of tank with a specially constructed lid, and is provided with a water-shed terminal cover. The tank is fitted with pole-hanging straps. The apparatus illustrated has an output of 7 kVA when working at 400 V, and is one of a large number supplied to one undertaking. The voltage regulation of the system has been materially improved, quite apart from the decrease in kVA demand, which resulted in a very substantial reduction in the power bill. The l.p. 400-V supply in the case of this undertaking is distributed to farms where numbers of small motors are used and where individual power-factor correction would not be desirable, or, in fact, possible on commercial grounds.

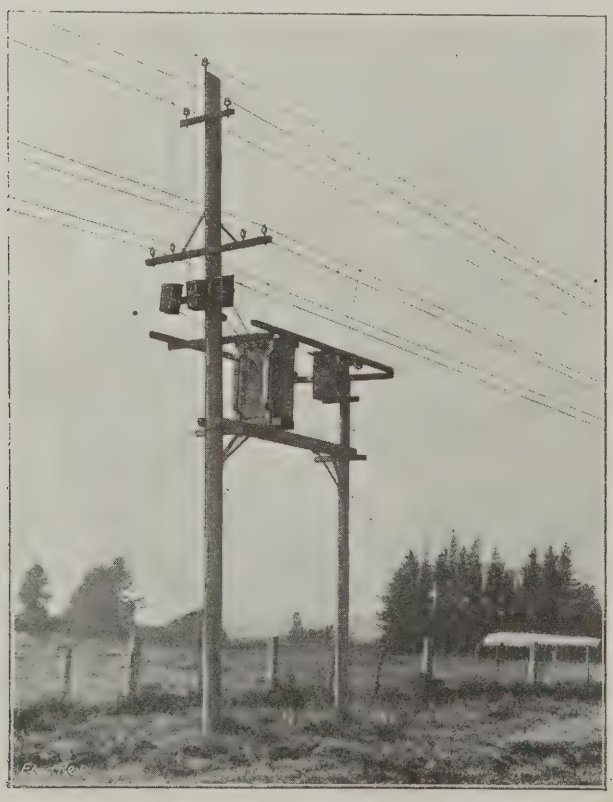

Fig. 2.—Pole Condenser and Transformer, in Position.

A Cable-Haulage Equipment.

A recent production of Messrs. F. T. Murdoch & Co., Ltd., Thompson Street Works, Belfast, is a new patent winch, fig. 3, specially designed for pulling cables through conduits. It is

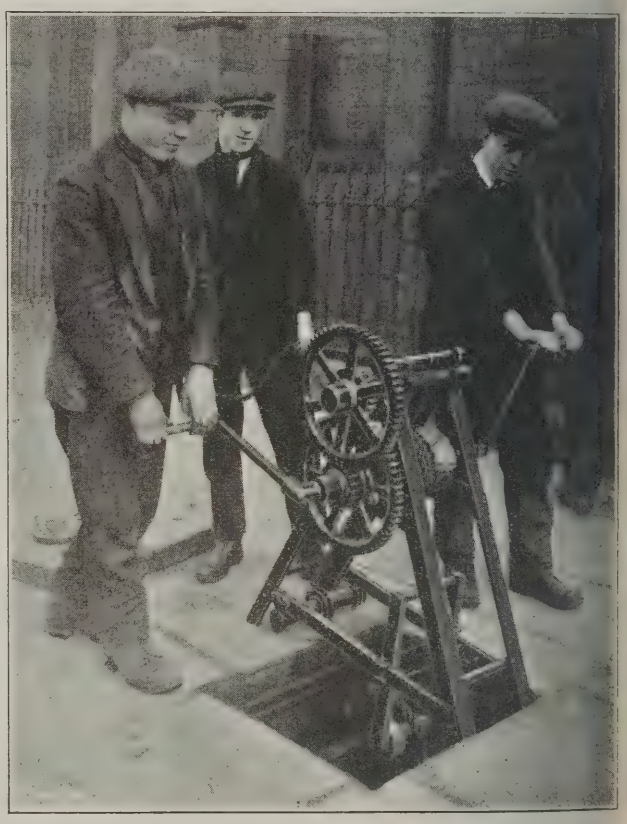

Fig. 3.—A Cable Winch.

claimed to be stable and to require no weights to hold it down. The hauling rope passes over a guide, which leads the rope directly from the centre of the conduit, and can be adjusted so as to eliminate all friction against the corner of the manhole, &c. The rope is next led over the sheave provided at the rear side of the winch, and goes thence to the winding drum. The apparatus can be placed over any part of the manhole so as to allow a workman clear passage into the hole, and central fixing over the particular cable which is being worked on. Three speeds are provided, giving ratios of 9 to 1, 3 to 1, and 1 to 1. Only two axles are employed, and none of the usual clutches or drop bars.

A Radio Valve Testing Machine.

A machine which tests thermionic valves more rapidly than the most expert human operator is in use at the factory of the Westinghouse Lamp Company at Bloomfield, N.J., U.S.A. The capacity of the machine is 30,000 tubes a day, and for the period of several months during which it has been in service its record for accuracy stands at 99.9 per cent., the 0.1 per cent. error being chargeable to the accidental introduction of defective valves into the good stock. The machine was invented by Mr. Allen B. Dumont, of the Westinghouse

Company, and its operation is simple. It consists essentially of a revolving disk, about 3 ft. in diameter, which carries sockets for valves on one of its faces; as the disk revolves, the valves are connected successively, a defective one being knocked out of its socket by an electromagnetically acting plunger located at the rear of the machine. Valves that are hopelessly bad are unceremoniously shot on to the scrap heap; but those which can be reclaimed are gently laid on to moving belts which convey them to operators for further treatment; good ones are also placed on a belt and carried to the wrapping department. The valves are tested for short circuits, broken filaments, emission, gassiness, and high and low plate current; some of the tests involve the use of extremely small currents, and special sensitive relays are employed to operate the ejecting mechanism. Each test is a positive one, and each testing mechanism will eject a valve if it should be damaged during the process of testing. The machine is arranged to be fed by two girls seated side by side, one of whom must be left-handed and the other right-handed, but it will soon be re-arranged to be fed automatically in order to bring it up to its full productive capacity.

The Electrical Imports of Ceylon.

THE following table shows the value of Ceylon's imports of electrical and allied materials during the past year. The figures have been taken from the recently published official returns. The corresponding statistics for 1925 have been added and notes of decrease or increase are also given :—

	1925. Rupees.	1926. Rupees.	Inc. or dec. Rupees.
Control and switchgear—

Turbo-Generator Construction in Russia.

AS we recently reported, an attempt is being made greatly to extend the construction of steam turbo-generators in Russia. At the works of the Electroforce (Elektrosil) in Leningrad the construction of 5,000-kW sets has been begun for the first time in Soviet Russia. At the same time preparations have been completed for the turning out of similar sets of 10,000 kW, the patterns and drawings having already been finished. These machines are intended for the stations at Kieff, Novorossisk, Kizel, &c. The works, which belongs to the State Electrical Trust, claims to have orders on hand for 44 turbo-generators of a total of 240,000 kW. In connection with the development of this branch large orders for milling and other machines were placed abroad and this plant is now beginning to arrive in Leningrad.

Still further expansion is proposed by the Metallurgical Works in Leningrad in the matter of steam turbines. This undertaking has started the erection of a new large turbine shop which with a full load, it is claimed, will be able to turn out turbines of a total of 325,000 kW per annum, or nine times more than the existing shop is able to construct at the present time. According to the scheme, the costs of production will at the same time be reduced by not less than 20 per cent. The new works will be equipped with foreign machines which will permit of a very considerable extension of the production while only involving the doubling of the number of men employed.

The general work of electrification and industrialisation is bringing about an increasing demand for steam turbines. Prior to the war the construction of turbines was carried on only to an inconsiderable extent; the maximum power was only 1,250 kW. Altogether between 1905 and 1914 the Metallurgical Works, above mentioned, only turned out 44 turbines of a total of 50,000 kW. After the war, work on turbines was only recommenced at this particular works in 1921, when works of repair were executed. New turbines were begun in 1924, and now the works is building machines up to 10,000 kW, these being for the Southern Steel Trust. This size has not exhausted the capabilities of the works as, at the request of the Electric Current Undertaking (Elektrotok), a scheme is being worked out for the construction of two 20,000-kW steam turbines. In this connection it is mentioned that turbines are being made not only for normal pressure but also for higher pressures, and this year a turbine for about 440 lb. per. sq. in. will be turned out for the Vladimir-Alexandroff Textile Trust. At the same time turbines for 580 lb. per sq. in. with a capacity of 5,500 kW are to be made for the Krasny Treugolnik works. The technical possibilities of the existing turbine works was limited because it was only able to turn out machines of a total of 35,000 kW per annum, but the demand has exceeded this capacity many times over, so that it was decided to erect an entirely new and large works. A beginning was made last year and the completion of the first portion is expected to take place next year, the total expenditure being 5,800,000 roubles. The works will consist of 18 bays and will be, it is claimed, one of the largest in Europe intended for the construction of steam turbines. Last year three bays were finished, nine are to be completed this year, and the remaining six next year. In the current year a start will be made with the erection of the machinery, part of which has been ordered abroad, and thus the possibility exists that work on machine construction will begin next year. The final equipment of the works will be effected in 1930-31, when the demand for turbines, according to the General Metal Trust, will represent 450,000 kW per annum, which output the new works will be able to cover entirely.

Leningrad does not stand alone in the work of the development of the construction of turbines, as the Moscow Machine Trust is also working in the same direction, particularly with hydraulic turbines. Three such turbines of 3,600 h.p. are being built for the Swiran hydro-electric works, and it is stated that the works will now be able to construct similar turbines of up to 10,000 kW.

The Elimination of Waste.

The Report of the U.S.A. National Committee on Metals Utilisation ("Simplified Practice Recommendation, No. 57"; Government Printing Office, Washington, price 5 cents) gives the sizes of wrought iron and steel pipes, valves and fittings adopted at a general conference last year, which are said to fill over 80 per cent. of all normal requirements. Eighteen diameters are quoted between ⅛ and 12 inches (nominal), with three grades of thickness. It is stated that "the combined efforts of this general conference resulted in a reduction from a total of 62 sizes to 49 sizes of pipe, corresponding to an elimination of 20.96 per cent. and an elimination of 762 sizes of valves and fittings, or a 3.8 per cent. reduction in the current variety. . . . One concern has stated that their sale of the 4½-, 7-, and 9-in. sizes alone represents only one-third of the investment that is required to produce them, so heavily does the fabrication and stocking of the odd sizes drain their resources."

New Drum-Type Controllers and Motors.

The development by the British Thomson-Houston Co., Ltd., of Industrial Equipment with "Unbreakable" Resistances.

WITH the object of affording reliability and convenience from an installation and maintenance viewpoint, the British Thomson-Houston Co., Ltd., has developed a new line of reversing drum controllers for electric motors operating cranes, hoists, and such-like industrial equipment. They differ entirely in construction from those hitherto manufactured, and incorporate features based on experience of steel-works' auxiliaries and other plant, the operating conditions of which are arduous.

Drum-Type Controllers.

This range meets the requirements for a.c. slip-ring induction motors up to 75 h.p. and for d.c. motors up to 120 h.p., both at 550 volts: the same features are common to both types.

Fig. 1.—Pivoted Contact Finger.

The frame consists of separate top and bottom castings fixed together by steel bars and the sheet-iron back and front covers are both detachable so that the whole of the inside is accessible. The body of the drum consists of ribbed castings carrying the copper contact segments with their renewable arcing tips, and all the segments are of the same diameter. The starwheel is secured to the top of the cylinder, is designed to give positive notching at each starting point, and the pawl is fitted with a large roller and pin to obtain a maximum wearing surface.

All the contact fingers are built up of extruded sections: the fixed base is clamped on four sides of a mica-insulated square steel bar, and the moving part is attached to the fixed part by a pivot screw. The renewable tip is adjusted in relation to the segments on the cylinder by means of a screw which operates on an extension of the finger arm and is adjustable to one-sixth of a turn and automatically locked in position; the arrangements are shown in fig. 1. Pressure of the finger on the segment is maintained by means of a compression spring, which is free to function without friction on any part of the finger: the pivot is not used for carrying current, a flexible shunt being fitted between the moving

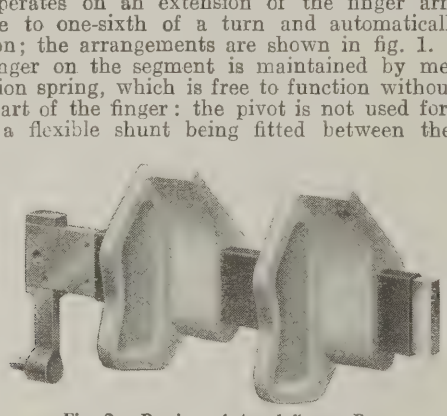

Fig. 2.—Portion of Arc-deflector Bar.

and the fixed parts, entirely enclosed, so that it cannot be accidentally damaged.

Any finger can be removed without disturbing the remainder, or taking out the whole bar, simply by taking out the cable and removing two screws. Interlocking fingers are provided, so that an electrical interlock exists between the controller and a protective circuit breaker, preventing the latter being reset unless the controller is in the "off" position.

Fire-proof arc deflectors between the contacts prevent cross arcing, the portion which acts as a barrier between each finger being moulded in one piece with the portion which is shaped to slip over and enclose the pole piece of the magnetic blow-out; screws are not used for fixing them, and to facilitate inspection the assembled deflector is hinged so as to swing clear of the fingers (figs. 2 and 3). A new type of crank handle has an automatic "off" position latch to prevent the handle being accidentally knocked into a running position, the latch mechanism being released from below the casting which forms the handle by the weight of the operator's hand on the top of the knob.

Controllers for a.c. duty are of similar design, as may be seen by reference to fig. 3, which shows that four arc deflectors only are required in this design, as cross arcing can only take place between the fingers in the stator circuits.

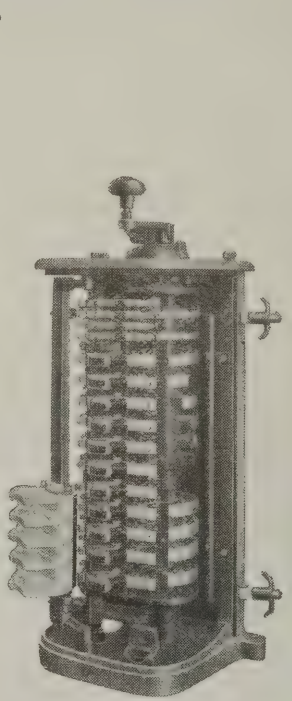

Fig. 3.—A.C. Drum Controller.

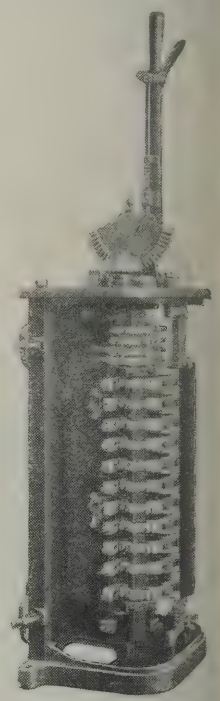

Fig. 4.—D.C. Drum Controller with Vertical Lever Gear.

All the controllers can be fitted, if desired, with lever mechanism having either a vertical or horizontal "off" position; alternatively, a rope-wheel can be used in the case of the smaller sizes, and spring return mechanism can also be employed.

"Unbreakable" Resistances.

The B.T.-H. Company has recently perfected manufacturing equipment for producing new light resistance grids so graded that the temperature-resistance co-efficient usually associated with the "unbreakable" type does not adversely affect the equipment with which it is used: if specially required, grids can be supplied with practically a zero temperature-resistance coefficient. The resistance

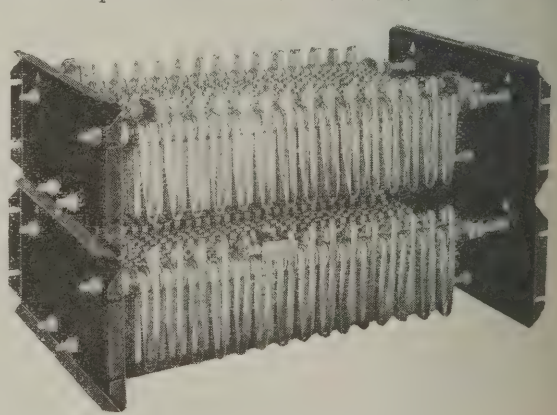

Fig. 5.—"Unbreakable" Resistance.

element is composed of a continuous strip, machine formed into grids, without joints between the two external terminals (fig. 5). High-resistance steel strip, heavily plated with zinc to render it rustless, is generally used, but in some cases another rustless material may be used for the smaller sizes.

Resistances can be supplied in any of the combinations already adopted for cast grids: for crane service each bank is mounted in a separate box, consisting of two pressed-steel end-frames so flanged that any number of boxes up to six

may be bolted together to form a self-contained unit. The grids are supported between the end-frames by four mica-insulated steel bolts, adjacent grids being insulated from one another by mica washers between steel washers. Another feature is the method of mounting the terminals so as to ensure good contact between terminal and resistance, and also rigid support for the incoming cable: the terminals are of extruded brass section and are bolted to a loop in the grid immediately above one of the insulated bolts for all units up to approximately 200 amperes at the 5-minute rating.

Motor Developments.

Some interesting features can be recorded in connection with a range of a.c. and d.c. motors, U-type, which has recently been put into production by the British Thomson-Houston Co., Ltd. The range covers sizes from ½ h.p. up to about 40 h.p. for squirrel-cage machines, up to 15 h.p. for slip-ring machines, and from ¼ h.p. up to 35 h.p. for d.c. machines; the latter are suitable for conversion as generators. The machines all comply with the B.E.S.A. requirements; they can be supplied with any of the usual types of enclosure and all of them incorporate end-shields spigoted into the cast-iron frames. The peripheries of the shields are machined, ensuring close-fitting joints between them and the enclosing sheet-steel covers; the latter are interchangeable. Fig. 6 shows a protected d.c. machine.

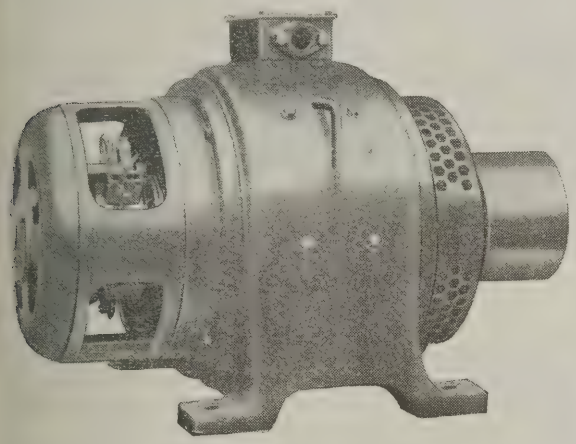

Fig. 6.—D.C. U-type Motor.

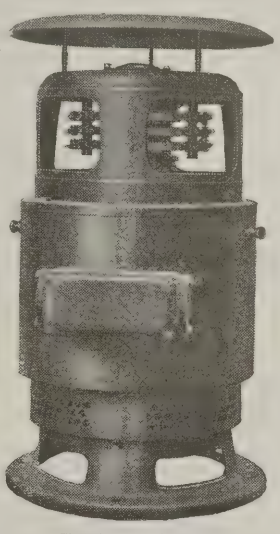

Fig. 7.—Vertical Induction Motor.

On each motor a roller bearing is fitted at the driving end and a ball bearing at the other end, whilst any of the motors can be used with its shafts at a given angle from the horizontal or vertical, as the case may be, and with the provision of special bearings, if necessary, the motor will run in any position between horizontal and vertical. Fig. 7 shows a vertical protected slip-ring induction motor. The skirt-base casting is separate from the end-shield casting, so that machine makers can readily fit their own adaptor rings to obtain the necessary drive. The construction of the stator is claimed to be such that the air gap will be correctly maintained.

The rotor construction of the squirrel-cage motor is interesting, in that there are no joints in the cage, and as only one metal, aluminium, is used for both the bars and end rings, the rotor is immune from fracture due to unequal expansion. The bars and end-rings are cast in one piece by a patented centrifugal process which, it is claimed, ensures both absolute uniformity of texture and absence of blow holes or air pockets.

The slip-ring rotors are fitted with bar-type windings on account of the simplicity and mechanical rigidity of the latter, and also because of the open spacing obtained at the end connections; this construction renders them particularly suitable for high speeds.

On the d.c. brush equipment the pressure fingers are designed to give uniform pressure on the brushes throughout their life, and the pressure can be readily adjusted without lifting the brushes. The brush holders are covered with moulded-on non-hygroscopic insulation, and their adjustment can be effected in an axial direction. The brush stud is directly attached to the yoke, and consequently the brush-gear is free from the possibility of the brush stud working loose and rotating due to shrinkage of the insulation. The brushes conform to the dimensions given in B.S.S. No. 96, and as the pig-tails are attached to the same terminals on the brush-holder as those for the machine leads, the brush current does not have to pass through any part of the brush-holder.

The a.c. brush-gear is insulated in a similar manner.

Mercury-Contact Motor Starters.

A New Multiple-contact Tilting Switch.

THE disadvantages with which the use of mercury-contact switches has been associated in the past are claimed to have been overcome in a new design of mercury multiple switch which has been embodied by Messrs. Isenthal & Co., Ltd., in a new range of motor starters which they have recently adopted.

Fig. 1. Mercury Container, Bottom.

The essential part is a specially designed mercury container which, by a tilting operation, makes or short-circuits the necessary step-resistance units of the starting apparatus. The container consists principally of two parts, box and lid,

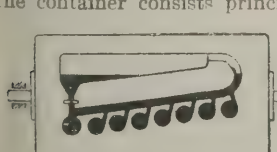

Fig. 2.—Mercury Disposition, "On."

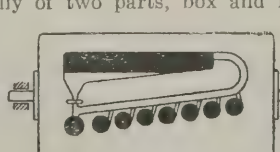

Fig. 3.—"Off" Position.

made of a moulded insulating material with perfectly machined contact faces, so that when screwed together they form a perfect seal for the mercury and an air-tight box. Fig. 1 shows the bottom section of the device in which are moulded the necessary mercury cups, channels, and reservoir. In the "off" position the mercury is contained in the last mentioned compartment, at the top, by virtue of the tilt of the box in the required direction, but when the opposite inclination is given to the device, the fluid runs through a calibrated aperture on the left, thus gaining access to the several cups. These are made of steel and at the back are provided with

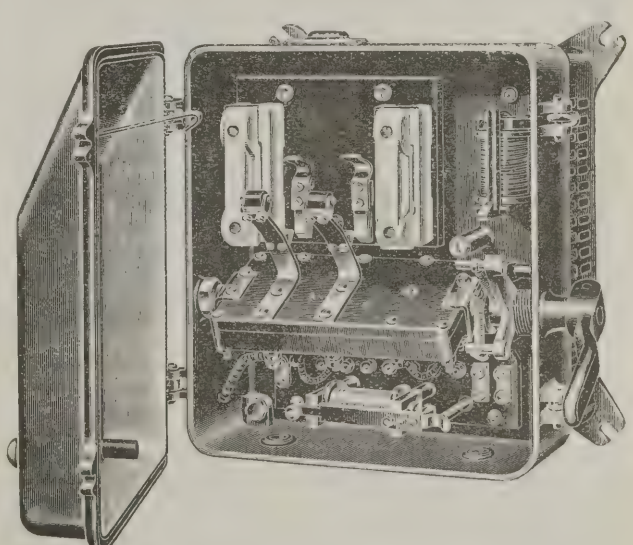

Fig. 4.—"Swichon" Hand-operated Starter.

screw studs and nuts for the resistance connections. The shape and grading of the channels and cups are such that the mercury stream carrying the current cannot break, except when required, at the point of contact, and that at each cup it immediately coalesces with the small amount of the substance which is retained therein. A small projection at the opening to each cup causes the mercury to collect there and then drop into the cup in bulk, so that full contact is made from the first.

The important feature of the apparatus is that the mercury functions in inert gas, eliminating the objection to sparking at the contacts. The chamber is air-tight and the small amount of air which is enclosed on assembly of the container is rendered inert after a few operations. It is obvious that once the box has been tilted into the "start" position the process of starting is quite automatic and independent of the operator. When the apparatus is tilted back again into the original position the mercury flows back into the reservoir through the channel at the opposite end to the entrance gate. Figs. 2 and 3 show the mercury disposition at the "on" and "off" positions of the container respectively.

The makers have incorporated this mercury-containing device in four types of "Swichon" starting apparatus, providing for hand, electrical, or mechanical operation, remotely or directly. Fig. 4 shows a simple starter of the first type for controlling small motors up to 5 h.p. For the control of larger motors it is intended to utilise the mercury tilting box as a master controller, operating a suitable set of contactors for the resistance stages or winding combinations. It should be mentioned that the actual breaking of the main circuit is performed outside the box, in order to totally eliminate any possibility of sparking on the mercury.

In conclusion, attention must be drawn to the one limitation of the mercury starter described above: it is not suitable for use on board ship or aeroplane for obvious reasons.

Some Recent "Metrovick" Contracts.

Examples of plant of large size and special features manufactured by the Metropolitan-Vickers Electrical Co., Ltd., for use both at home and abroad.

A FEW years ago an impression seemed to be prevalent that the construction of transformers of very large capacity, or for service at extra-high-voltage, was beyond the capability of British manufacturers. It is accordingly satisfactory to know that the ability of British firms to carry out such work has been amply demonstrated.

With regard to home contracts, what are described as the largest single-unit transformers yet made in Great Britain were built for extensions to the Barton power station of Manchester Corporation: they are three-phase, core-type units of 25,000 kVA each, with a voltage ratio of 6,600 to 33,000 volts, and are to be installed with the 41,000-kW steam turbo-alternator set recently ordered from the above-named company. The present British record for large capacity units is held by Metropolitan-Vickers main step-up transformers already in commission at Barton, *viz.*, six three-phase units, each of 19,500 kVA capacity, which have been in successful operation for about four years; one of these transformers, photographed recently while removed from its tank for inspection, is shown in fig. 1. In design, the new transformers will be similar to the original ones, arranged for forced cooling, and will be nearly 16 ft. long, 7 ft. broad, and 17 ft. in height to the top of the high-voltage terminal.

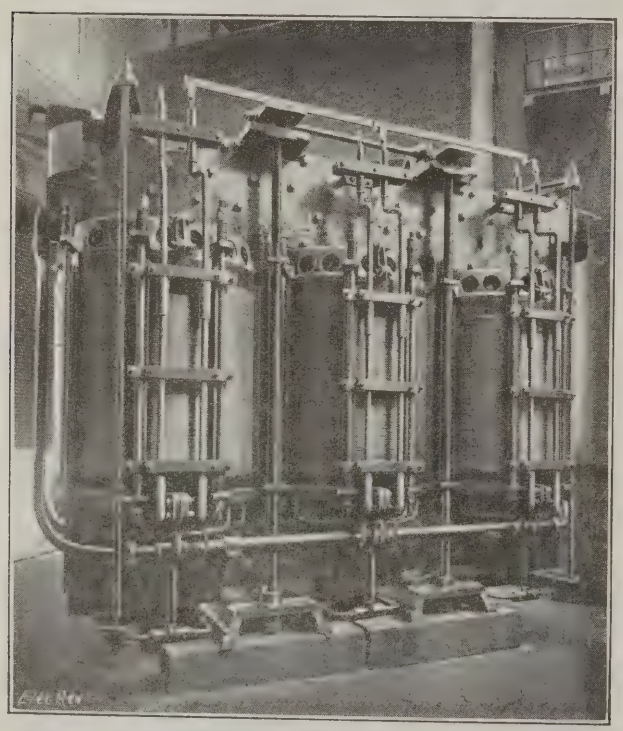

Fig. 1.—A 19,500-kVA, 3-phase, 50-period Transformer after 4 years' service in Barton Power Station.

Amongst transformers being supplied on foreign contracts are three-phase banks up to 54,400 kVA capacity per group: two banks of this capacity and one spare unit are being sent to South America, each bank consisting of three 18,113-kVA, single-phase, shell-type transformers for 13,650/28,500-volt operation at 50 periods; they will be fitted with oil conservators and breathers, two sets of cooling equipment per group being included in the contract, and the guaranteed maximum efficiency of these transformers is 99.34 per cent.

A 51,000-kVA bank of similar type, but designed for operation at 6,600/115,000 volts on outdoor service, is being built for a power station in Europe. The units of this group, as well as those of the 54,400-kVA groups above-mentioned, will be of greater capacity than any single-phase units hitherto manufactured in this country. Some idea of the size of the plant now being built may be obtained from fig. 2, which shows one of the single-phase units recently manufactured at the Metropolitan-Vickers works for the Victoria Falls and Transvaal Power Company, South Africa. The initial power plant which is being supplied by the company for the new Waikaremoana hydro-electric power station in New Zealand includes two 20,000-kVA, three-phase banks of single-phase transformers and one spare 6,666-kVA single-phase unit, water-cooled and arranged for outdoor service at 11,000/110,000 volts. The Great Indian Peninsula Railway has ordered 12 single-phase transformers, of the self-cooled outdoor type, to form four 11,000-kVA, three-phase banks for 6,600/110,000-volt

Fig. 2.—Single-phase Transformer of 11,000 kVA Effective Rating, one of many for service on a 132,000-volt system in South Africa.

peration in connection with the electrification of the main railway line north-west from Bombay.

Within the last few years Metropolitan-Vickers transformers aggregating over half-a-million kVA total capacity have been ordered and supplied for pressures of 110,000 volts and above, and the company is now completing extensions to its high-voltage laboratory, which will increase its capacity by over

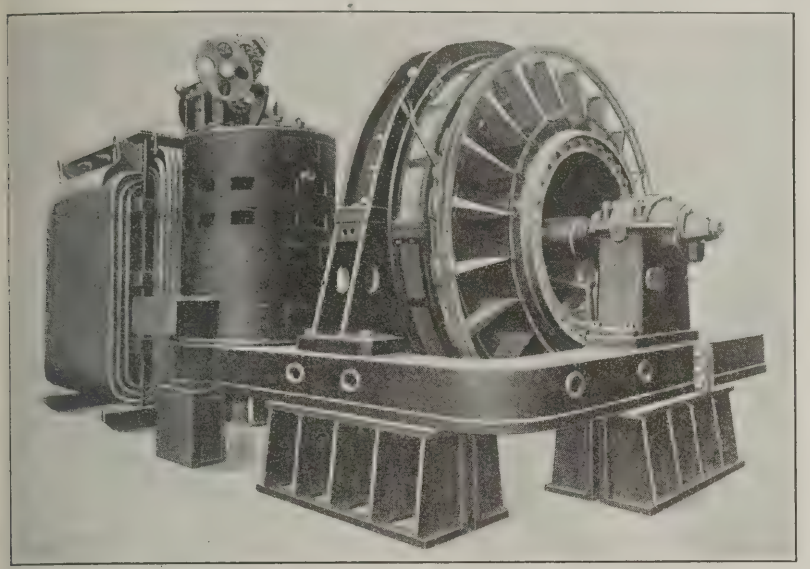

Fig. 3.—Rotary Convertor, with Induction Regulator and Transformer.

four times and include transformers for making commercial tests at one million volts.

Four rotary-convertor sets with special features have recently been completed by the company for sub-stations in Buenos Ayres; three are of 3,000-kW capacity each, and one is of 2,000 kW. Apart from size, the equipments are interesting in that they include induction regulators to provide wide voltage regulation, together with power-factor correction: moreover, the heavy control gear necessary for such large machines is electrically operated, and the motors for operating the induction regulators and the field rheostats are remotely controlled.

The incoming supply to the sub-station is at 27,500 volts, 3-phase, 50 periods. The transformers of the rotary sets are oil-immersed and self-cooled, three single-phase shell-type units in one tank for each of the 3,000-kW sets, and a 3-phase core-type unit for the 2,000-kW set. All four sets deal with either 3-wire 440-volt lighting, or 2-wire 580-volt traction load, this unusually wide range of d.c. pressure being obtained by means of the induction regulators. Fig. 3 shows one of the convertors, with its transformer and induction regulator, in the makers' works. The output of each 3,000-kW convertor is 6,800 amps. at 440 volts and 5,200 amps. at 580 volts; provision is made to carry a mid-wire out-of-balance current of 1,700 amps., and the machines run with a leading kVA in order to improve the power factor of the system. At full load, 1,900 wattless kVA is supplied by each machine when operating at 580 volts and 0.85 leading power factor on the h.p. side, and 4,000 kVA when operating at 440 volts and 0.95 leading power factor. The larger rotaries are tap started, a small motor-driven high-pressure oil-pump being provided to force lubricate the bearings in order to reduce the power required for starting.

The 2,000-kW set is similar, but is provided with a directly-connected starting motor on the Metropolitan-Vickers self-synchronising system.

The induction regulators are vertical, air-cooled, motor-operated, and forced ventilated by a motor-driven fan. The rotor movement, by which the regulator boost is varied, is effected by means of a small motor with worm reducing gear mounted on the top of the regulator. The motor controller-type switch is on the operator's panel, and a magnetic brake on the shaft ensures that movement of the regulator ceases immediately the motor is switched off; limit switches and mechanical safety stops are also fitted.

The control gear for all four sets is remote electricity operated; fig. 4 shows the main contactor panel of one of the 3,000-kW sets, while fig. 5 shows the panel carrying the knife-switch push buttons and small contactors from which the massive main contactors are operated. The control gear is on a separate 180/230-volt d.c. circuit, and interlocks provide that the contactors can only be closed in their correct sequence. The two controller-type switches on the panel are for the induction-regulator and field-rheostat motors respectively; the three-pole knife-switch is for the oil-pump motor.

Control gear of this type, in some cases accompanied by synchronising apparatus, has been supplied by the Metropolitan-Vickers Electrical Co. for installations including rotary convertors up to sets of 4,500-kW capacity.

Low-Loading Electric Vehicles.

For some time past commercial motor-vehicle practice has tended to lower the loading platform level, and builders of industrial electric vehicles are adapting their productions to the new order of things. Some time ago the Glasgow Corporation invited tenders for a fleet of thirty-six refuse-collecting vehicles, affording a large carrying capacity, low-loading line, small turning circle, and adequate sanitary protection for the contents. Many tenders were received, of which that of Messrs. Richard Garrett and Sons, Ltd., was accepted. The first vehicle has recently been delivered and is now on trial in Glasgow. The design enables a loading-line of 4 ft. 8 in. to be obtained, without reducing to any considerable extent the diameter of the road wheels. The driver's cab is well forward, the front axle being unusually far back, so that the vehicle has the large load-carrying capacity of from 4 to 5 tons on a comparatively short wheelbase. The Tudor battery is located above the front wheels and behind the driver's cab.

An electric vehicle recently supplied by the General Vehicle Co., Ltd., to the electricity department of the Manchester Corporation, took the form of a short-wheelbase tractor with a long low-platform two-wheel semi-trailer, the whole forming a flexible six-wheel vehicle specially designed for the transport of electric cable drums. The motor is so arranged that it drives a differential shaft by an enclosed silent chain, side roller chains transmitting the power to the rear wheels of the tractor. The battery consists of 44 Exide-Ironclad cells of 500 amp.-hour capacity, and is carried above the frame of the tractor behind the driver's cab; the cells are mounted on transverse rails, so that they can be readily removed through the sides. The trailer is designed to carry either a single 10-ton cable drum, or two smaller drums of 6 tons each. The tail board is hinged to the trailer platform, so that when lowered it forms a ramp up which the drums can be hauled by means of an electrically-driven winch on the vehicle.

Oil-Immersed Circuit Breakers.

A contribution to the study of the number of tests required to establish the rupturing capacity of an oil switch, in the form of a report (ref. G/T28) from the British Electrical and Allied Industries Research Association: startling conclusions are drawn.

By E. B. WEDMORE, M.I.E.E., W. B. WHITNEY, B.Sc.(Eng.), and C. E. R. BRUCE, M.A., B.Sc.

(*Abstract of Paper read before the* Institution of Electrical Engineers.)

WHAT number of tests is required to establish the rating of an oil circuit-breaker? The purpose of this paper is to examine the problem and state conclusions in language as free as possible from technicalities.

The simplest case of a single-break circuit breaker controlling the circuit between two poles of a machine was studied first, but investigation of the three-phase case is also in progress, and sufficient work has been done to show its extreme complexity; however, at least the same degree of reliability from the results can be obtained on three-phase work by two-thirds the number of tests required on single-phase, but it would probably be unsafe to take one-third the number as sufficient, because the *range* of variation already observed in the total energy of the three phases in the relatively small amount of test data available is greater than the *range* of variation of the total energy of groups composed of three separate single-break tests based on a much larger amount of data. It might be argued that the authors are too conservative in this and that, since there are six breaks, one-sixth the number of tests is sufficient. Though they cannot agree with such a view, they point out that, even if it were accepted, it would not materially alter the main conclusions of their paper.

An analysis of a large number of repeat tests on a given oil circuit-breaker shows that the energy liberated at a single break of a single-pole breaker varied from about 1 to 50 kW-seconds, and the variation is as large on commercial breakers of about the same capacity. Hence a large number of repeat tests is required before a rating can be checked even to within, say, 50 per cent. of its true value.

Although the B.E.S.A. specification uses the ability to continue carrying rated current after clearing maximum rated kVA as the criterion of rating, this criterion affords no quantitative measure of the condition of the auxiliary contacts (which are the ones involved in clearing the circuit), nor does it take account of the possible expulsion of smoke, oil, or flame, which may be sources of grave danger to operators in the vicinity. Since a *quantitative* measure of efficiency is required, the authors have based their conclusions on a study of the magnitude of the arc energy liberated between the contacts, which may usually be considered amongst the main causes of destruction of switchgear. This energy can be definitely measured by means of oscillographic records of the current through, and the voltage across, the arc.

The authors have chosen a somewhat arbitrary maximum of 50 kW-seconds, but they are satisfied that any modification (under the given conditions) would not alter the general conclusions. For instance, the chance of the occurrence of, say, 30 kW-seconds or over is 1 in 14, *i.e.*, on the average, about 14 tests would have to be done before one occurred that was 30 kW-seconds or over; this at once shows that two tests cannot be hoped to give any reliable information. Further, the chance of getting, say, 47 kW-seconds arc energy output or over is about 1 in 1,000, or, on the average, about 1,000 tests would have to be done before one could be reasonably sure that the circuit breaker had been subjected to within a few per cent. of its worst strain.

In the commercial testing of heavy circuit breakers it is obviously impossible to do 1,000 tests, and we therefore want to know how near the truth we could get if we only do, say, 5, 10, or 20 tests. This is a problem in probability and the results of the author's calculations are shown in a family of curves (in the original paper) which indicate the manner in which the maximum values vary. Consideration of the maximum of a group of tests is unsatisfactory as an indication of the maximum possible and mean values do not materially reduce the limits of uncertainty.

Put in a rough-and-ready way, the authors' investigations indicate that if a single-phase, single-break circuit breaker twice clears, without serious distress, a single-phase dead short-circuit on a supply circuit capable of giving a maximum of, say, 10,000 kVA, all that can be assumed is that the circuit breaker is safe for operation on about 1/24th the kVA, or, say, 400 kVA. If it clears:—

5 tests at 10,000 kVA it is safe for operation on about 1/8th, or 1,200 kVA;

10 tests at 10,000 kVA it is safe for operation on about 1/5th, or 2,000 kVA;

50 tests at 10,000 kVA it is safe for operation on about 1/2, or 5,000 kVA.

This striking result indicates that there is little hope of being able to check the rating of an oil circuit-breaker by the methods usually accepted in commercial testing, even on three-phase work, without doing a prohibitively expensive number of tests. Moreover, the necessary number of tests would have to be greatly increased unless the arc energy output that will just cause a given criterion of distress is accurately found by some other means. Such means must allow of the stress-producing forces being rigidly controlled and increased little by little in suitably graded steps, but this is a problem still awaiting solution. The two tests specified by the B.E.S.A. specification are thus totaly inadequate. These results are quite contrary to commonly accepted opinion and have only been possible owing to the large number of tests available.

So far we have only dealt with the *checking* of a rating, but the difficulties multiply when a manufacturer is faced with the problem of determining the rating of a new design of breaker. Two distinct problems are involved, namely:—

(i) What arc energy output and rate of output a given breaker will stand *between its contacts.*

(ii) Determining the kVA and other *external* conditions which, when associated with the operation of the circuit breaker, will never result in a greater energy output *within* the breaker than the safe limit determined under (i).

In the absence of any other aids, such as the B.E.A.I.R.A. is gradually securing, the manufacturer must start by making an intelligent guess at the rating before checking it by the process of repeat tests. A series of small steps may have to be taken, each requiring 50 tests, and even then, when the distress limit is reached, he cannot be sure that the energy released in the switch in any test has been appreciably more than half the possible maximum.

Unfortunately, we have not sufficient data to be certain that when the externally applied load, or kVA, is increased or reduced, the maximum release of energy inside the circuit breaker in a given number of tests is increased or reduced proportionately, so that it might be necessary to carry out even longer series of tests to determine the shape and limits of the distribution curves at various values of applied kVA.

The only solution of the problem appears to be the systematic discovery and study of every variable entering into the production of arc energy and the discovery of the laws governing the magnitude of these variables and their inter-relationship and the crystallising of this information in the form of a general formula. Such a formula would contain constants, some of which would undoubtedly have to be determined by a few tests on each new type of breaker at a current in the neighbourhood of its current rating, but once these tests have been carried out it should be possible to determine by calculation the limits of variation in arc energy that would occur in a given breaker operating under given circuit conditions.

The British Electrical and Allied Industries Research Association has been engaged for several years on a careful analysis of variables with this end in view and is now within measureable reach of success so far as the range up to 20,000 kVA (single-phase) at 6,600 volts is concerned, but, in regard to certain causes of variation, research at higher ranges may be necessary before the safety of applying the formula to such higher ranges is established.

In conclusion, the authors point out that their observations regarding the probability of occurrence of high values of arc energy after a certain number of operations give strong grounds for belief that unexplained failures of circuit breakers may not be due to mysterious over-voltages, or other bogies, but may simply have been the result of the circuit breaker operating at the bad end of its energy distribution curve, the rupturing capacity having been overestimated due to inadequate previous tests.

[The paper was illustrated with a kinematograph film. The research work was carried out at the Carville power station of the Newcastle-upon-Tyne Electric Supply Co.—Eds., Elec. Rev.]

Discussion.

Mr. G. W. Partridge, in opening the discussion, said he was disappointed in the paper in that he thought the authors should have arrived at something more definite. At Deptford many severe "shorts" were experienced—in one day as many as 50 occurred—and they all happened with a power factor varying from 50 to 75 per cent. Years ago he installed a new oil switch which normally carried only 1 or 2 A. It blew up the first time it was operated; also the second time after it had been carefully reinstated. It was discovered that, owing to static effect, the switch broke at the top of the wave at five times the normal pressure, or about 35,000 V. Experimental work was necessary to see if operation could not be ensured on the zero line. He thought that horizontal operation would prove better than vertical. It would be better to increase the number of breaks and so reduce the liberated energy at each break. One of the difficulties of the manufacturer was the chemical separation of the oil, the gas from which often got mixed with copper vapour which "shorted" all the live metal near. A switch which was designed to open at a certain loading often had to close on similar conditions. With the increasing size of generating stations, the cost and size of the oil switch would have to be increased unless some quick-operating apparatus could be evolved to reduce the generating pressure at the time of short-circuit.

Mr. H. W. Clothier said he received the general impression from the paper that the extent of variation of the liberated arc energy was greater than was generally realised. But the authors did not take the electrical industry into their confidence. They did not tell enough of the explanation of the variables, and he did not think that the conditions given were sufficient to account for such wide variation. What was the oil doing? It was exposed—and the atmosphere around Newcastle was often damp. The tests were made on apparatus of abnormal construction, open, and with a single break. Most commercial equipment had two breaks, and was closed in with a strong cover. Most failures were due to the bursting of tanks; but the test tank provided no equivalent. What was wanted was a knowledge of the maximum arc energies—could the authors correlate those energies with the static energies on the tank? He preferred the strong-type tanks to those that were made to yield. The easement might give out; then the weak tank would have to go. He asked if the authors could say what was the reduction in arc energy liberated where two breaks in series were employed. Were the authors justified in assuming that the variations were as large on the commercial breaker? The Association had tested commercial breakers at Carville, and the tendency was to increase the capacity of oil switches as the result of those tests. He criticised the authors' comments on the B.E.S.A. specification. The important factor of the stress on closing was not covered in the paper, but it was by the B.E.S.A. It frequently happened that research apparatus struck a zone of instability which was not met with in commercial equipment. He emphasised the need for testing plant of larger capacity in this country, where we had to submit to the humiliating position of having to take breakers abroad for testing. He suggested that a meeting of manufacturers of this country should be convened to obtain the reason why we were not equipped with testing plant equivalent to that possessed by competing nations.

Mr. R. W. Gregory did not feel sure that the inconsistency of the test results was not due to bad conditions. If the generator had been of only one-tenth the size, would the same inconsistency have obtained? He calculated that on the authors' results the chances of a switch breaking at the worst conditions in actual practice on 6,000 V would be a million to one, and on 30,000 V 2,000 to one. It was necessary to find out how much money could be expended to take care of these chances.

Mr. P. R. Boulton pointed out that the apparatus in question was not an oil switch at the actual time of break. If the oil could be made to be present at the actual time of break, the temperature could be kept down. He had arranged apparatus which broke at 10,000 ft. per second at 0 points instantaneously. The oil was not only present at the commencement of the rupture, but was under very high pressure and actually moving in the direction of flow caused by the break. The apparatus made millions of breaks on a.c. with no sign of consequent deterioration of the contacts. It did not matter what metal the contacts consisted of; steel would do as well as copper.

Dr. C. C. Garrard said that the experimental switchgear had only a remote resemblance to commercial apparatus. The variation was not a true criterion, as switch failures were due to gas explosions. The explosion energy was greater than that of the arc, and it was therefore necessary to take a more practical view of the operations. There was no difficulty in designing a switch to break 10,000 kVA. Information was wanted concerning operation at 1,000,000 kVA. He had calculated that in the largest generating station the cost of the switchgear was 1s. per kW installed.

Mr. E. B. Wedmore replied to the discussion, and said that the real research of the Association was concerned with the intensive study of the variations. Certain patents had been applied for, and the position would be explained later. Tests under heavier power and higher pressures had established the main contentions of the paper, and the same distribution had been obtained. Since the paper was written, a number of tests had been carried out at Carville which confirmed the results given in the paper. The problem was associated more with arc energy than with any other quantity.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Duty on Bakelised Paper.

On April 12th, Mr. A. Alexander asked the Secretary to the Treasury whether the wrapping paper duty was being charged on bakelised paper used exclusively for electrical insulation purposes; and, if so, whether the duty was levied on the value of the body-paper or on the manufactured value.

Mr. R. McNeill said he understood that bakelised paper consisted of paper with a coating of varnish or other material, and that the body paper was usually of a dutiable description. In such cases, duty was chargeable on the value of the coated paper, as a whole, if within the limits of dutiable weight.

Interference with Broadcasting.

On April 12th, Mr. Montague asked the Postmaster-General whether his attention had been called to the effect of spark signals sent out constantly by the Lloyd's station at Niton, Isle of Wight, which made the wireless receiving sets for which licence fees had been paid in Sandown, Shanklin, Blackgang, and district, practically valueless; and whether he would make representations to the company concerned as to the advisability of substituting continuous-wave messages for spark signals to ships entering the Channel.

Viscount Wolmer, who replied, said that the wireless station at Niton was a Post Office station used for communication with ships and in the interests of safety of life at sea. Although some interference with the reception of the Bournemouth broadcast programmes was unavoidable in the immediate vicinity of the Niton station, there should be no serious interference at Sandown, Shanklin, and the district when reasonably selective receiving apparatus was used. The Daventry programmes could be received without difficulty even 200 yards only from the Niton aerial. An International Radiotelegraph Conference was to be held at Washington in the autumn of this year, at which the question of spark transmission from ships would be considered. In the meantime it was not practicable to take any steps to restrict the use of spark apparatus on ships.

Beam Service to Australia.

On April 12th, Viscount Wolmer informed Lieut.-Commdr. Kenworthy that the Anglo-Australian beam wireless service was opened for public traffic on April 8th. No public ceremony took place, but a Press demonstration was given on April 7th, when complimentary messages were exchanged between the Secretary of State for Dominion affairs and the High Commissioner for Australia in London and the Governor-General and the Prime Minister of the Commonwealth.

Replying to Sir H. Brittain, Viscount Wolmer said that the service was being operated successfully. It was too early at present to express an opinion upon the volume of traffic.

The Budget.

During the Budget discussions certain members took strong exception to the Government's proposal to abolish the Ministry of Transport.

Mr. Townend, a Labour member, said that the Ministry of Transport was empowered to give effect to the Electricity Acts of 1919 and 1926. The latter Act involved an expenditure of £33,500,000 of public money. By 1940, in the opinion of certain authorities, the Ministry of Transport would have had control over the expenditure of no less than £200,000,000 of the taxpayers' money. And yet without a word of explanation they were told that that Ministry was once again to be divided into more than one department, and huge combinations and groups would find that questions would be dealt with in different ways. It was important that all these matters should be under one head.

Mr. J. Hudson, another Labour member, pointed out that although the country had entered on an enormous electricity scheme, to be supervised by a special department, the Government had decided to scrap that particular department.

Housing Enterprise.

In a recent *Evening News* advertisement a housing estate company announced a number of attractive features which distinguished its houses, stating that "among the standard fittings are electric radiators, cooker, and a 2-valve wireless set with a loud speaker."

Correspondence.

Correspondents should forward their communications **as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

Machine Tools in the Power Plant.

The problem of equipment for the workshop connected with the power plant is one of long standing. Some folk seem to muddle along without tools of any sort; when anything goes wrong, rush tactics predominate, accompanied by rush prices, and much unnecessary loss is incurred.

The power plant of any size can never be an ideal one without machine tools at hand for emergencies; the real live engineer realises that the extra cost of all repairs would in itself soon pay the cost of tools, and uses every effort to get them installed. One of the best equipments of this sort known to the writer was obtained by the engineer-in-charge in an interesting manner, which he usually describes as "free of charge," and is well worth the attention of others. On his taking charge of this plant, his only equipment consisted of an old lathe and an older drilling machine; pointing out their uselessness to the powers-that-be, he suggested that he should be allowed the disposal of all scrap machinery and metal about the place, and that the money so received be put aside as a tool and equipment fund.

To this proposal the firm agreed, and he very soon got busy; within two years he not only purchased his machine tools, consisting of lathe, shaper, two drilling machines, large and small, and a small planing machine, but many other appliances, some of them for testing purposes. Everything he wants is on hand, and all was obtained in this way.

The firm being an old one, a good deal of old machinery, far more than anyone but the engineer realised, was lying about. This was all dismantled and most of it was broken up; the various metals were sorted, brass, bronze, copper, tin, lead, and white metal, were all carefully graded, and soon mounted up to a considerable weight. Tenders were then invited from those having a market for metals, and no machinery or junk of any sort was sold in bulk, but as metal of various kinds, all of which commanded market prices; this entailed very little cost, the necessary sorting being mostly a spare-time occupation, but it increased the returns considerably. With this equipment the engineer is saved a good deal of worry and is to a large extent independent of others. All running repairs and renewals can be put in hand in good time and in the easiest manner, and many little things are got ready in advance for the next overhaul. It is also a wonderful help when getting in estimates for various alterations and the like; the fact that he has plant of his own has without doubt brought about much keener prices all round, It is also possible to carry out many experiments of various kinds that would be unthought of if every little stud or pin had to be purchased outside.

This engineer also puts discarded plant, not completely worn out, in a more saleable condition when it is thought that better prices will result, thus making his own pathway to better plant easier. In every plant there is some use for machine tools, and once they are installed more and more jobs are found for them; everything is kept in a better state of efficiency throughout the plant. Many slight leaks can be stopped that without tools are apt to be neglected, and it is soon apparent that it pays, and often handsomely, to have them as part of the engineer's outfit.

Belfast, *April 13th*, 1927. W. S.

Legal.

"Electric Hare" Dispute.

In the Chancery Division on April 12th, Mr. Justice Tomlin had before him two motions by the Liverpool Greyhound Club, Ltd., and the Leeds Greyhound Association, Ltd., asking for injunctions against the Greyhound Racing Association, Ltd., restraining the latter from claiming that it was the sole licensee for Great Britain in respect of a patent for electrically-operated "hares." For the first plaintiff it was stated that, with the apparatus in question, the "hare" could be made to travel at 60 miles per hour. Counsel for the defendant company offered to give an undertaking in the terms of the notice of motion, without making any admission as to any question at the trial. That undertaking being accepted by the plaintiffs, Mr. Justice Tomlin said that he would make no order except that the costs of the motion would be costs in the action.

Fraudulent Conversion Charge.

The Times reports that on April 12th, before Alderman Sir Harold Moore, at the Guildhall, Elie Stacey Charlier, a company promoter, was charged with the fraudulent conversion of money entrusted to him by various persons for the preliminary expenses of forming an electric railway compa in Canada. The prosecution stated that the accused was American citizen who was adjudged bankrupt in July la The main allegation against him was that he only remitt to Canada small portions of the sums entrusted to him a appropriated the remainder for his own use. Mention w made of three sums amounting to £5,450 which had be handed to the accused. The case was adjourned.

La Radiotechnique v. Norton Wireless Co., Ltd.

Mr. Justice Romer, in the Chancery Division on April 12t heard a motion by La Radiotechnique, a French compar for an injunction restraining the Norton Wireless Co., Ltd., 17, Norton Folgate, E.C., from passing off radio valves n of the plaintiff company's manufacture as and for th goods, and in particular from selling or offering for s valves marked with the words "Radio Micro" and "Rad Micro Special" in cartons similar in appearance to those the plaintiff company.

Mr. Courtney Terrell, for the plaintiffs, said that h clients' goods were well known in the trade, and it w obvious that the defendant company's cartons were a co of theirs.

His Lordship granted the plaintiffs an injunction *ex par* over the first Friday next sittings.

Reviews.

Heat-Power Engineering. Part I, Thermodynamics a Prime Movers. By William N. Barnard, Frank Ellenwood, and Clarence F. Hirshfeld. New York John Wiley & Sons, Inc. London: Chapman & Hall, Lt Pp. xii+493; 251 diagrams and numerous charts. Pri 22s. 6d. net.

To those of our readers who may be familiar with "Hirs feld and Barnard's Elements of Heat-Power Engineering it may be mentioned that the volume under review co stitutes the third edition of that well-known American tex book. Owing, however, to the new ideas which have bee developed during recent years in connection with the conve sion of heat into mechanical work and the improvement i the methods of treating the theories underlying this conve sion, it has been found necessary to rewrite many of th chapters in their entirety, while in the others an attempt h been made to bring them up to date. The result is a boo which may be regarded as covering the whole field of th various theories underlying what in this country is know as modern heat engine practice.

For the benefit of those who are not acquainted with th work it may be mentioned that it covers what the autho call the full year's course in heat-power engineering of th American technical colleges and universities, and since knowledge of mathematics up to and including the differenti and integral calculus is assumed, as well as a knowledge mechanics and physics, it might be suggested that it woul prove suitable for a second or even a third year's course i our own engineering colleges. At the same time it is n to the student alone that this book should make an appea To the power-station engineer and the engineer who is in an way connected with the design and manufacture of moder power-station equipment a knowledge of fundamental principle underlying the working of such equipment is absolutely esse tial, particularly if he is to appreciate the value of the variou developments which are being continually brought to hi notice. Thus, much is being said at the present time abou the advantage of using high-pressure steam superheated t a high temperature. The question at once arises as to th extent to which either or both of these can be employe to increase the thermal efficiency of the steam plant. Again the question of re-heating the steam between the variou expansion stages in the turbine and the bleeding of steam a various pressures for regenerative feed-water heating, is on which is becoming of increasing importance as the capacit of our turbo-alternator units is increased. Similarly, th theory underlying the various problems in internal combustio engine practice are also fully investigated. Other question which are less prominent at the present time, but which nevertheless, may assume great importance in the near future are also discussed in their theoretical aspects, such as, fo example, the binary cycle engine, and the engineer who ha a knowledge of the fundamental principles underlying these questions is well equipped to understand the full value of such developments as he may read of from time to time in the proceedings of our technical institutions and in the engineering Press.

With regard to the general scope of the book, it will be sufficient to mention that it proceeds along more or less accepted lines, the alternation of theory and practice being skilfully maintained to retain the interest of the student throughout, but we feel that as regards the references to

actual engines and plant the value of the book might have been enhanced—particularly from the point of view of the technical college student—by the inclusion of the reproduction of a few well-chosen photographs. Here, also, we cannot fail to notice the fact that the volume before us is the third edition of an earlier work. This is particularly noticeable in the chapter on steam turbines, which, in view of their supreme importance in the development of power from heat, are very inadequately dealt with, only 11 pages being given to the description of the various types of turbine and their method of operation as compared with 50 pages devoted to the description of reciprocating engine types. At the end of the book there is a very useful collection of problems classified according to the chapters, the answers being appended to enable the student to check the accuracy of his work. Various steam tables and charts are also appended, and in this connection it is noteworthy that the properties of steam for pressures up to 1,200 lb. per sq. in. and superheat temperatures 400 deg. F. above saturation temperature are given, together with complete data for very high vacua. We cordially recommend this book to all engineers who are anxious to study the theories underlying the conversion of heat into power.

Trade Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from April 13th:—

Wizard. No. 478,601. Class 6. Domestic clothes washing machines.—General Electric Co., Ltd.

Unitone (lettering and design). No. 472,329. Class 8. Electrical inductances.—Igranic Electric Co., Ltd.

Ace. No. 477,001. Class 8. Dry batteries (electrical) not for medical purposes.—E. Kohn, 115, Dulwich Road, S.E.24.

Van Raden. No. 477,248. Class 8. Electrical storage batteries.—Van Raden & Co., Ltd., 567, Foleshill Road, Coventry.

Bluebell (design only). No. 478,001. Class 8. Radio-telephonic and telegraphic apparatus and parts thereof.—Lissen, Ltd.

Varsola (lettering and design). No. 478,407. Class 8. Radio-telephonic and telegraphic apparatus and parts.—R. R. Thompson, Ltd., 38-42, Chestnut Grove, New Malden.

Jonphilite. No. 478,410. Class 8. Electric cables.—Johnson & Phillips, Ltd.

Splendor (lettering and design). No. 476,164. Class 13. Electric incandescent lamps.—M.S.L., Ltd., 50, Holborn Viaduct, E.C.1.

Zelco. No. 477,350. Class 13. Electric lamps (ordinary).—I. Weiner, trading as the Zenith Lamp Co., 5, Dyers' Buildings, Holborn, E.C.1.

Tenax No. 478,434. Class 13. Wall plugs or sockets.—Hommade, Ltd., 150, Great Titchfield Street, W.1.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

AINSDALE (Southport).—Cinema; Messrs. Sutton, builders.

BARNSLEY.—Artificial light installation, Market Street centre; medical officer of health.

BEIGHTON.—School (300 places), for Derbyshire E.C.; H. W. Skinner, clerk, County Offices, Derby.

BLACKBURN.—Improvements to Emmanuel School (£2,000); Rev. J. E. Samuel, vicar.

BLACKPOOL.—Additional housing scheme (78), Bispham, for the T.C.; borough surveyor.

BRADFORD.—Reinstatement, after fire (£100,000 damage), wool warehouses and offices, Manor Row; J. Riddiough and Co. Garages for motors and railless-cars, Thornton Road; city architect.

BREDBURY AND ROMILEY (Cheshire).—Additional 50 houses, for the U.D.C.; surveyor.

BRIERLEY HILL.—Additional housing scheme (68), for the U.D.C.; surveyor.

BROMLEY (Kent).—Premises for mental defectives (£16,000), for the B.G.; Burnand, Pickett, Ltd., builders, Wallington, Surrey. Additional 40 houses, for the T.C.; Percy A. Coad, architect, 90, Nightingale Road.

BROMSGROVE.—Additional 56 houses, Rubery, for the R.D.C.; surveyor.

BURPHAM (near Guildford).—50 houses, Paddocks estate; Hodgson, Lunn & Co.

COCKERMOUTH (Cumberland).—Bank, Main Street, for the National Provincial Bank, Ltd.

CROYDON.—Arcade additions, North End; S. Burmseter. Additions, The Picture House, North End; Clayton and Black, Prince Albert Street, Brighton. Housing scheme (336), Mitcham Road, for borough engineer.

(Addiscombe).—Cinema, Lower Addiscombe Road; Addiscombe Cinema Co., Ltd., 46, High Street.

DUDLEY.—Rehousing scheme (180 houses to be replaced), for the T.C.; borough engineer.

DUNDEE.—Linoleum factory; Gray, Robertson & Co., solicitors. Shopping centre at Craigiebank housing scheme; city architect.

ECCLES (Lancs.).—Post office and telephone exchange, for H.M. Office of Works, King Charles Street, London, S.W. Development of estate (70 houses), Bridgewater Estates, Ltd.

EXETER.—Three blocks of almshouses, for the Municipal General Charities; Wright & Jerman, 21, Cathedral Yard, architects.

FAREHAM.—96 houses, for the U.D.C.; district surveyor.

GILLINGHAM (Kent).—Boot repairing factory, Canterbury Street, for the Co-operative Society; L. G. Ekins, architect.

GODALMING.—Engine and generator houses, workshop, &c., Borough Road pumping station, for the T.C.; H. C. Head, consulting engineer, 90, High Street, Winchester.

GOLDTHORPE.—Office and stores at sub-station for Dearne District Electricity Board.

HASTINGS.—Alterations, Palace Hotel, White Rock; H. Ward & Son, architects.

HOYLAKE.—Extensions to children's home, for Wirral B.G.; Finchett, Lancaster & Archer, architects, 13, Hoghton Street, Southport.

IRISH FREE STATE (Dublin).—Jam factory, Poplar Row and Annesley Place, for R. & W. Scott.

KIDDERMINSTER.—Extensions to sugar beet factory (£90,000), Foley Park, for the West Midlands Sugar Beet Co.

LANARKSHIRE.—Infant department at Bishopbriggs School (£7,000); clerk, County Education Authority, Hamilton.

LANCASTER.—Extension of the Royal Grammar School; S. Wilkinson, county architect, 16, Ribblesdale Place, Preston.

LEEDS.—Housing scheme (118), Meanwood and York and Selby Road estates. Pavilions and conveniences and rebuilding of garages, &c.; W. T. Lancashire, city engineer, Municipal Buildings.

LEICESTER.—1,200 houses, Braunstone estate; Lanchester, Lucas & Lodge, for Corporation.

LEITH.—Shed at Harbour (£16,400); harbour engineer.

LIMEHURST.—Rating offices, with electric lighting and heating, Waterloo, for the R.D.C.; J. W. Carey Titterington, clerk, 113, Old Street, Ashton-under-Lyne.

LINCOLN.—Showrooms and offices (£10,000), Silver Street, for the T.C.; city surveyor.

LONDON (Barking, E.).—Headquarters, for the Essex Territorial Army Association; secretary, Market Road, Chelmsford.

(Camden Town, N.).—Alterations, fire station, for L.C.C.; J. & C. Bowyer, Ltd., Norwood.

(Catford, S.E.).—Bazaar premises, 130, Rushey Green, for F. W. Woolworth & Co., Ltd., Kingsway, W.C.

(Fulham, S.W.).—Buildings, Fulham Palace Road, Silverton Road, and Crabtree Lane; Wallis, Gilbert & Partners, 29, Roland Gardens, S.W.

(Ilford, E.).—Garage, showrooms, shops, &c., Eastern Avenue (£45,000); Super Mobile, Ltd.

(Kensington, S.W.).—Alterations, Sussex Place and Onslow Gardens; Westminster Bank, Ltd. Extensions, Town Hall and central library; borough engineer. Rebuilding Kensington, Fulham and Chelsea Hospital, Finborough Road; Sir Aston Webb & Son.

(Kentish Town, N.W.).—Polytechnic buildings, Kentish Town Road; L.C.C. Education Committee.

(St. Pancras, N.W.).—Workshops, 12-20, Fitzroy Place; Association for Promoting the Welfare of the Blind. Extensions, Grafton Street; Maple & Co., Ltd.

(Streatham, S.W.).—32 houses, Sherwood Park Road; Wates, Ltd. 30 houses, Pendennis Road; Chapple and Utting. 37 houses, Southcroft Road; Thomas and Westcott. 80 houses, Southcroft and other roads; E. Clarke & Sons.

(Tooting, S.W.).—Kitchen reorganisation, South Western Hospital; Metropolitan Asylums Board.

MACCLESFIELD.—Pooster station, waterworks, for the T.C.; borough engineer. Additional 103 houses, for the T.C.; borough surveyor.

MILNGAVIE.—Cinema, Mrs. Patrick Breckenridge, Milngavie.

MITCHAM.—Extensions to maternity home, Devonshire Road, for the U.D.C.; Chart, Son & Reading, architects, Union Bank Chambers, Croydon.

NELSON (Lancs.).—Cabinet works, Scotland Road, for W. Blades (£8,000).

NEWPORT (I. of W.).—Joinery works, Leverton Row; H. W. Morey & Sons, Ltd. Municipal offices, Town Lane; borough engineer.

NEWTON ABBOT.—Electricity supply, new factory, Kingsteignton Road; Webmetals, Ltd.

ORMSKIRK.—Housing scheme (50), for the West Lancashire R.D.C.; A. Dickenson, surveyor, Derby Street, Southport.

PAISLEY.—Wing at Museum; the curator.

POOLE.—Bathing pavilion (£10,000), for the T.C.; borough surveyor.

SALISBURY.—Bazaar premises, Silver Street, for F. W. Woolworth & Co., Ltd., Kingsway, London.

SHEFFIELD.—South-Western District Sorting Office for H.M.O.W.; Contracts Branch, King Charles Street, London, S.W.1.

SOUTH SHIELDS.—School of art; Education Committee. Amusement and dancing pavilions, South Foreshore; H. Hill, architect for Mr. C. J. Daniels.

STAMFORD (Lincs.).—Re-erection of Palace Theatre, Blackfriars Street, for R. R. & E. D. Edinborough (£6,000).

STOCKPORT.—Additional 100 houses, for the T.C.; borough surveyor.

STRETFORD.—Elementary school, King's Road, for Education Committee; P. Hodgkinson.

TORQUAY.—Additions, Natural History Museum, Babbacombe Road; trustees. 128 houses, Westhill estate, for Corporation; Universal Housing Co., Ltd.

WADDON.—23 houses and 24 flats, Stafford Road; Southern Foundries, Ltd.

WINCHESTER.—Out-patients' department (£12,000), Royal Hampshire County Hospital; secretary.

WORCESTER.—Nurses' home (£12,000), for the B.G.; the clerk.

The

Electrical Review

VOL. C. APRIL 29, 1927. No. 2,579.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON." Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

The Southern Railway Contract.

THE decision of the directors of the Southern Railway Company to place a substantial order for the supply of twenty rotary convertors and sixty transformers with a Swedish concern because of its disapproval of the arrangements existing between certain British electrical manufacturers, has occasioned widespread discussion in the newspapers. The manner in which publicity was given to the decision may be in some measure responsible for the unusual extent of it, and for the wrong impression which may easily have been left upon the mind of some sections of the community unfamiliar with the necessities of the modern industrial situation. It is said that some small blame rests elsewhere for what may be individual mishandling of the matter, a circumstance which might be quoted, if it were necessary, in demonstration of the individual freedom which exists however complete the compact between members of a group may be.

The official versions of the matter, as prepared by some of the various interests concerned, are set forth in detail in later pages, and they need not be repeated here. So much has been published by us lately regarding the present industrial situation, both from our own collected information and from the annual statements made by the B.E.A.M.A. Council and its chairman, and the speeches delivered at meetings of electrical manufacturers, that readers of the ELECTRICAL REVIEW, whether as purchasers or producers of electrical machinery and plant, may be regarded as familiar with the arguments showing the need for co-operative action if we are to be assured security and efficiency for these departments of the industry.

It has become fairly generally recognised that combinations or amalgamations of, and agreements between, different producers in the same industries, also inter-industrial connections, have become an essential factor of life in British, American and Continental industrial communities because they conduce to efficiency of product and of production, more satisfactory wages and employment, and a fairer return on

capital. This is subject to the qualification that such arrangements do not operate harshly against the common interest or stifle reasonable and legitimate competition or savour of a policy of "dictation" likely to irritate and antagonise purchasers, however large or small. Those of our readers who can recall the cut-throat competition of pre-cooperative days, with the resultant small return on capital, will not need to think twice regarding the desirability for employing measures to avoid a return to such a state of affairs.

It is in respect of the nature of these measures that the Southern Railway controversy has arisen. The record of that railway was so consistently satisfactory in support of British electrical industry previous to the present incident that one is driven to regret still more than ordinarily the departure from its patriotic utilisation of the services of British manufacturers and British workpeople. That departure would appear to have been made somewhat hastily—we will not say petulantly—and seemingly some injustice has been done to British concerns. The manufacturers who were invited to tender indicated the best that they could do individually, as we understand it, and it was open to the Railway Company to approach others who are considered to be well able to meet the specification. The statement of the Railway Company, which we print elsewhere, was issued in London at a date when the invited firms had submitted further modifications to meet its wishes and criticisms, so that the statement itself was at the time it was published not a correct representation of the position. To the criticism that one manufacturer was willing to abandon certain stipulations on condition that he received another part of the contract, there is the very pertinent reply that conditions regarding part of the contract were also made by the Swedish Company and accepted by the Railway Company. And the unwillingness of the latter to open the tendering to firms other than the invited three because it desired to standardise on a type of machine already installed seems unjustifiable when one remembers that in the final event the company has actually made that change by introducing a fourth from abroad. It is difficult to imagine that it was seriously believed that the three uninvited concerns could not meet the specification.

We have dealt in the foregoing, and in our report of the details, with the principal points in the affair as we understand them, while admitting that there may be some considerations affecting the original tendering with which we are unfamiliar, and in conclusion can only repeat our regret that the Southern Railway should have felt it necessary in this case to depart from its excellent practice of using British equipment. Railways as such can hardly with consistency reproach others for appreciating and availing themselves of pooling arrangements, and we believe that if they can anyhow find it possible to come into closer conference with British electrical manufacturers and appreciate a little better the conditions of competitive production, they will find that from grouped operations they can probably secure more efficient results than from unrestricted competition. The principle of co-operation in connection with railways, mines, the chemical industry, and other departments of activity, involves all kinds of understandings and arrangements, and the application of railway principles in the electrical industry is by no means new. It is far from being the desire of British electrical manufacturers, whether grouped or operating individually, to antagonise the railway or any other public authorities. What all need to do at the present time is to operate unitedly, reconciling conflicting interests, as far as practicable, for the well-being of the nation as an industrial one.

Possibly there has been fault on both sides in the present case, and we may hope that somehow or other the features that have occasioned the breach of good relations may be removed so that the railway companies and corporations of the kingdom will utilise the services of British industry rather than go abroad for their requirements.

"The Electrical Retailer and Dealer."

The April issue of this publication is being distributed along with this number of the Electrical Review, and it is also being circulated widespread separately amongst the large class of electrical retailers from end to end of the United Kingdom. Evidence is reaching us that it is fast establishing its position; its value to those for whom it is produced is well recognised, and it is bringing orders to manufacturers and traders. In addition to its usual section particularising suitable selling lines for across-the-counter trade, it deals editorially with various matters of topical and news interest, and contains signed articles on "The Electrical Retailer's Banking Account," "Price Tickets," "Practical Advertising," and "Selling on Deferred Payment Terms."

Belgian Foreign Trade.

The statistics of Belgium's foreign trade in electrical goods, which we publish on another page, show that the imports of dynamo-electric machinery, though dwindling, are still larger than the exports, which at the same time showed an advance in 1926 of about 75 per cent. over 1925.

Of cables, submarine and underground, Belgium imported last year only a little less than she exported, but it is disconcerting to notice that, whereas her imports from Great Britain were negligible, her exports to Great Britain amounted to 1,650,000 kg., as compared with 415,000 kg. in 1925. Belgium is advancing strikingly as an exporter of insulated wire and cable, as an examination of the figures will show. She still purchases large quantities of porcelain insulators from abroad, but France and Germany do the bulk of the trade. Last year she nearly trebled her exports of telegraph and telephone apparatus. Looking at the record of electrical exports as a whole, it is noteworthy that Belgium is extending her sales not only with her own Congo colony, but also with South America, Australia, and China.

Swiss Railway Electrification.

Recent criticisms on the financial situation of the Swiss Federal Railways have resulted in some very interesting articles in the Swiss daily papers. From more than one of these articles details can be gleaned which go to prove that, far from the electrification of the State Railways being an error of judgment, it is incontestably an advantage from every point of view.

For instance, the development of hydro-electric works in Switzerland is in close correlation with the increasing needs of the Federal Railways. Ever since 1904 the latter have been studying the scheme of electrification now in process of completion, and in 1913 they voted a sum of 38 million francs for the first line electrified. In 1920 the first electric locomotive passed through the St. Gothard, and in 1925 the power produced by Swiss hydro-electric works had leaped from the 800,000 h.p. of 1912 to 1,850,000 h.p.

Again, it has been represented to the Federal Railways that by the time the present electrification is finished in 1929, their debt will be augmented by over 550 million francs. But the interest on this sum will be easily covered, according to the most stringent calculations, by the annual economy in combustible, rolling stock and staff; at least 26 millions a year will be saved on coal, 5 millions on rolling stock, and 12 millions on staff, making a total of 43 million francs.

Up to the present the Federal Railways remain obstinately impenitent, and rightly so, on the subject of their electrification, and appreciation of the improvement increases daily.

The Poplar Electricity Undertaking.

A brief record of the undertaking and descriptive features of the "Lopulco" pulverised coal-fired boilers, 12,500-kVA turbo-generator, and 6,600-volt switchgear installed in the new generating station.

NOTABLE as a ship-building centre 300 years ago, Poplar became a metropolitan borough in November, 1900. To-day its area of 2,327 acres, which supports a population of 162,618, has a rateable value of £996,400.

When Mr. J. Horace Bowden, M.I.E.E., M.I.Mech.E., became engineer and manager of the electricity undertaking in 1904, he commenced the replacement of the original d.c. generating plant, which was commissioned in 1900, by 3-phase, 6,600-V turbo-generators, which were added to from time to time until the generating capacity had reached a total of 16,000 kW in 1922. Then, following visits to the Continent of Europe and the United States of America, Mr. Bowden commenced to plan a new station, the inaugural ceremony of which was performed on Monday last by Sir Andrew Duncan, M.A., LL.B., chairman of the Central Electricity Board.

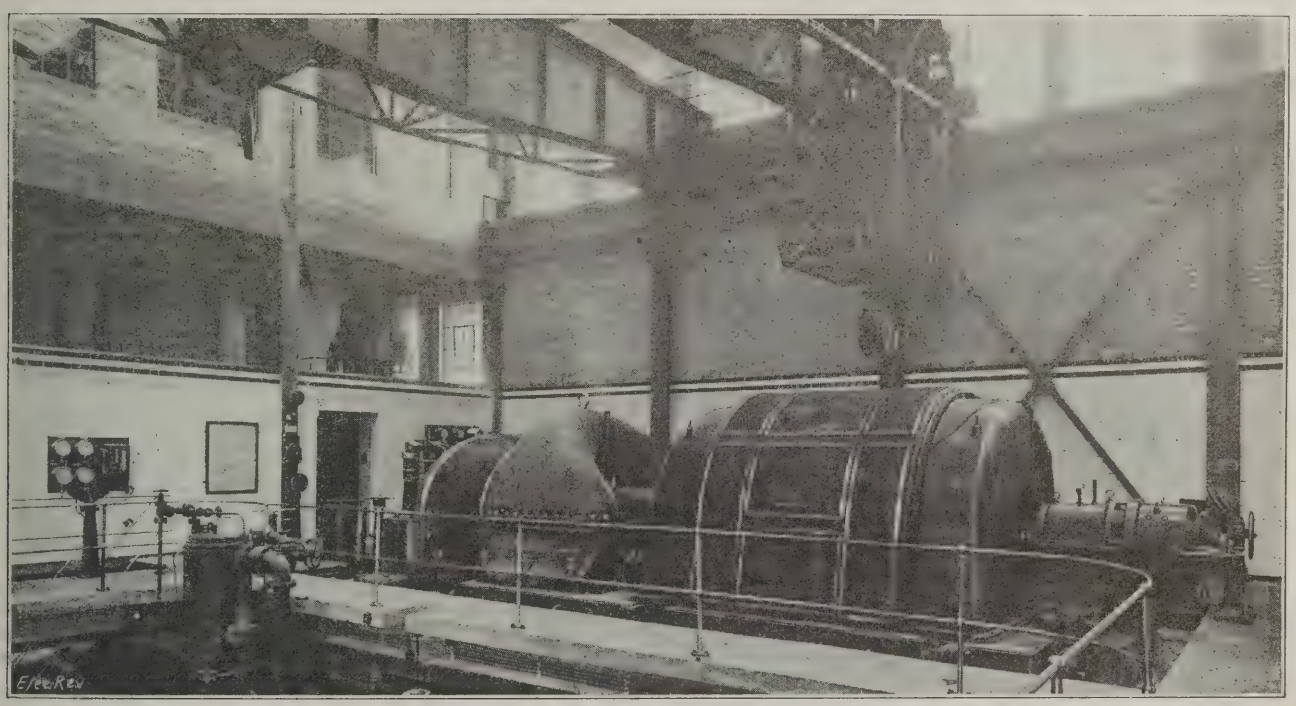

Fig. 1.—The 12,500-kVA Steam Turbo-generator Set in the New Poplar Power Station.

The present capacity of the two stations is 26,000 kW, the new one consisting of one 10,000-kW set with three pulverised-coal-fired boilers, and provision has been made for a further extension of 15,000 kW. The estimated capital commitment of the undertaking at March, 1927, was £684,760, or £26.3 per kW installed. The load factor of the supply generated is approximately 31 per cent., and it is estimated that 34,250,000 kWh will be sold during the year 1926-27, excluding reciprocal supplies, at an average charge of 1.62d. per kWh; the fuel consumption is approximately 33,000 B.th.u. per kWh delivered to the feeders, or 3.5 lb. per kWh sold, at an average cost of 39s. 3¼d. per ton delivered.

The whole of the generating plant installed between 1899 and 1908, excepting three 20,000-lb. boilers, has been scrapped to make room for subsequent extensions. The site of the new station is in proximity to the older one in Glaucus Street, and a canal facilitates the delivery of water-borne coal and also provides condensing water; all the work was carried out to the specification of the main contractors, International Combustion, Ltd., in conjunction with Mr. J. H. Bowden. Two grab cranes on the wharf, one steam and one electric, unload the barges and deliver coal to hoppers for storage or for feeding through a Simon or alternatively a motor-driven Avery scale, a motor-driven magnetic separator, the elevator and conveyor systems to the two main bunkers. The gravity bucket elevator, supplied by the Mitchell Conveyor and Transporter Co., lifts the coal through a vertical distance of 70 ft. and discharges it into the raw fuel bunkers. The pulveriser house contains plant made by International Combustion, Ltd., and also the East Ferry Road Engineering Co. The two "Lopulco" dryers are of the rotary steam-heated type, driven by totally-enclosed variable-speed d.c. motors through reduction and bevel gear. The two Raymond mills are each capable of pulverising 12,000 lb. per hour, so that 85 per cent. of the ground product passes through 100-mesh and all passes 40-mesh screens; each mill is fitted with an exhauster fan with an air duct system, by means of which the mixture is conveyed to the cyclone separators.

The Bradley pulverising installation was constructed by the East Ferry Road Engineering Co. The raw coal from the bunkers is passed through an automatic feed arrangement on top of the dryer, which is of the rotary type, containing a vertical series of trays, over which the coal is distributed during its passage; drying is effected by means of waste gases from the boiler flue, which are passed through the dryer by a fan and escape to the stack. The gases are cooled

before entering the dryer to prevent ignition of the coal and an auxiliary inlet prevents recondensation of the moisture driven off by the coal; the dryer has a capacity of 4 tons per hour. The dried coal then passes to a belt-driven three-roll mill capable of pulverising 3½ tons of coal per hour to such a fineness that 75 per cent. will pass a 200-mesh sieve and 95 per cent. a 100-mesh sieve. The pulverised coal is passed by a short screw conveyor through a dust separator to a cross screw conveyor having a capacity of 10 tons per hour, which discharges to the vertical bucket-type elevator which delivers the coal to the main screw conveyor that carries it to the three storage bins situated at the top of the boiler house, one over each boiler. There are five burners to each combustion chamber, and the five corresponding feeders are arranged in one group, driven by a variable-speed motor, which enables the feeder to be run at any speed between 35 and 140 r.p.m.; each feeder screw is operated through a clutch and may be isolated from the group. A primary fan is provided for each group, having an output of 3,500 cu. ft. of air per minute against a static load of 16 in. w.g., the temperature of the air being 300 deg. F. The fans are located on the feeder floor and air is drawn from the air-heater duct.

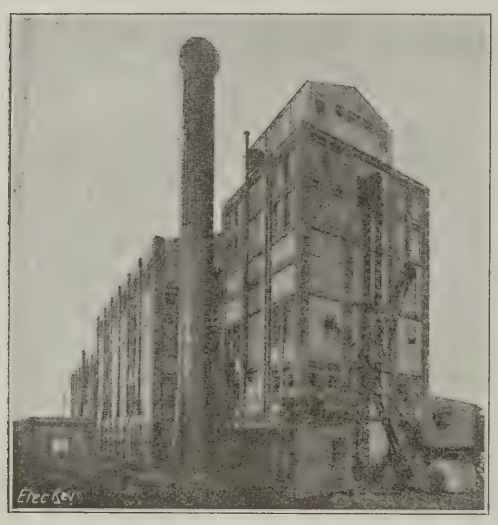

Fig. 2.—Pulveriser House and Thomson Chimney.

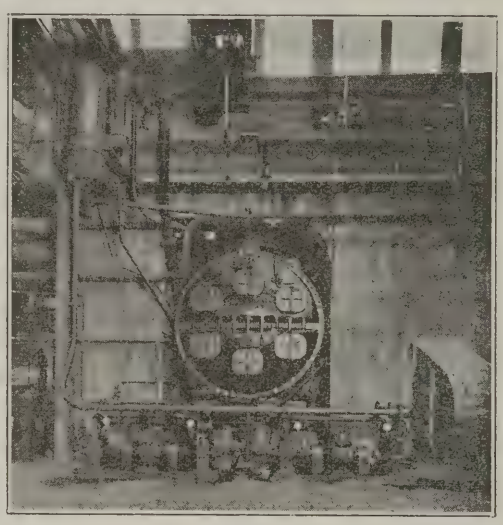

Fig. 3.—Condensing Plant.

The boiler-room equipment at present consists of three units by the Vickers Boiler Co., each designed for a normal evaporation of 50,000 lb. per hour and an overload evaporative capacity of 70,000 lb. per hour, these figures being actual evaporations. The working pressure is 325 lb. per sq. in. and the final temperature of the steam 700 to 714 deg. F.; two boilers are of the standard cross-drum steel-cased design and one of the double-circulation type; the heating surface of each is 6,200 sq. ft.

Feed water is supplied to the boilers through Foster economisers supplied by the Power Specialty Co., Ltd., each having a heating surface of 2,196 sq. ft., raising the temperature of the water to 240 deg. F. and reducing the flue-gas temperature to about 540 deg. F. Each boiler is equipped with a superheater of 3,950 sq. ft., supplied by the Ferguson Superheater Co., Ltd. The air for combustion is preheated by "Usco" plate-type heaters manufactured by the Underfeed Stoker Co., Ltd.; each consists of 80 elements 11 in. long, giving a heating surface of 6,950 sq. ft., and under normal conditions raises the temperature of the air from 60 deg. F. to 260 deg. F. whilst reducing the flue-gas temperature from 540 deg. F. to 340 deg. F.

The combustion chambers follow standard "Lopulco" practice, being provided with the usual water screen and water-cooled rear-wall elements. The secondary air from the preheater is admitted to the side walls, which are hollow, and the air is still further preheated before entering the combustion chamber. Air for combustion is supplied by a forced-draught fan in the basement, capable of delivering 30,000 cu. ft. per minute at normal temperature against a static head of about one inch water gauge; the air is discharged through the preheater to the primary fan suction at the feeder level and to the secondary air-ports in the combustion chamber. The products of combustion, after passing through the economiser and air preheater, are discharged by the induced-draught fan to a main flue at basement level which is common to all three boilers and connects with a steel chimney outside the boiler house. Each induced-draught fan is driven by a two-speed motor and is capable of dealing with 45,000 cu. ft. of flue gas per minute at a temperature of 380 deg. F. against a static head of 3-in. water gauge. The fans were supplied by Musgrave & Co.

A sluicing trough in the basement floor transports

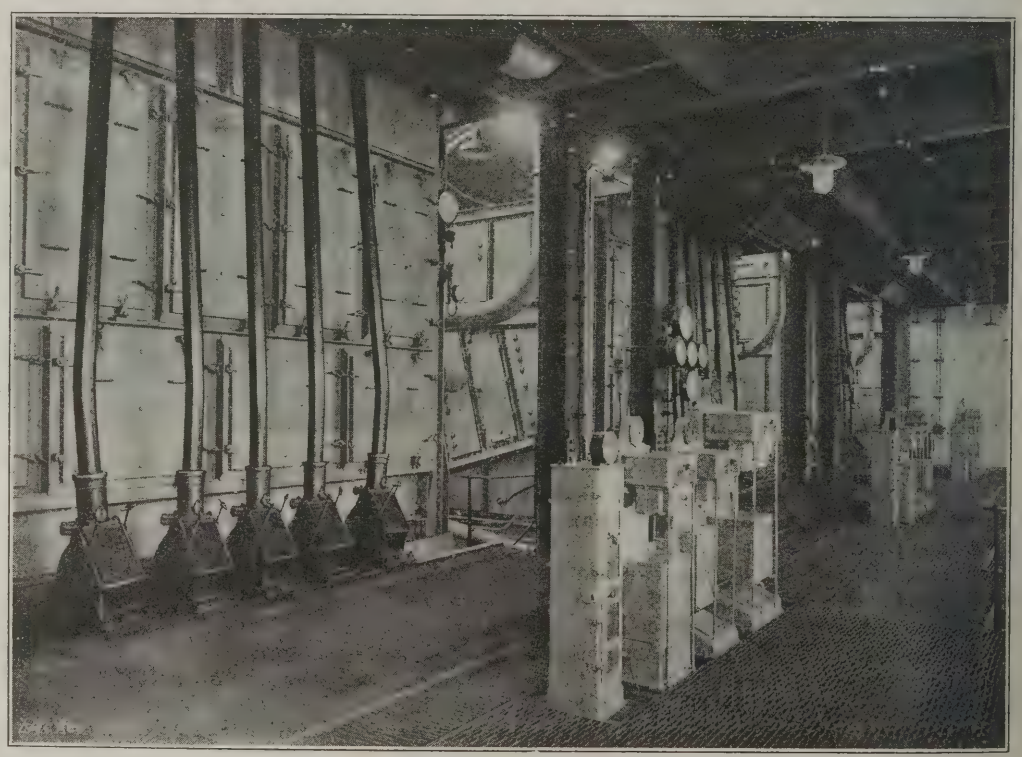

Fig. 4.—New Boiler House: Burner and Operating Floor.

the ashes to a pit outside the boiler house, where they can be handled by a grab crane and loaded into wagons. The water-circulating system is self-contained, the

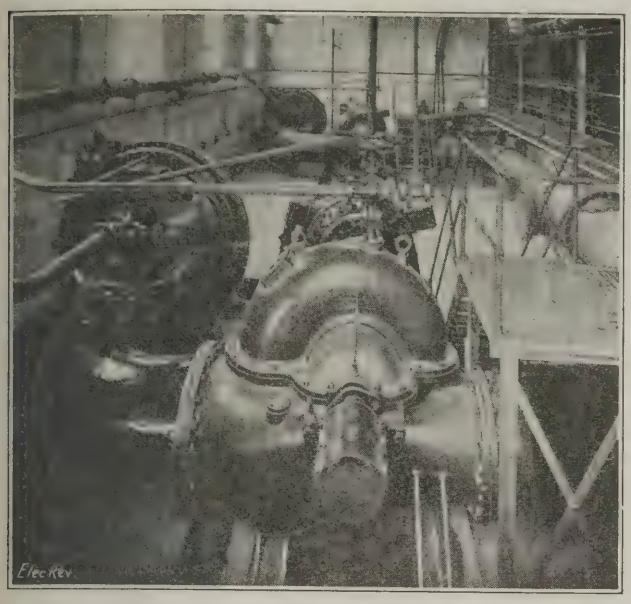

Fig. 5.—Condenser Circulating Water Pumps.

motor-driven pump being in a pump house adjacent to the ash pit and drawing its supply from a culvert fed through a metal screen from the ash pit. The ash system was supplied by the Underfeed Stoker Co., Ltd.

A pure feed-water supply has been provided for by the installation of a Vickers flash evaporator for breaking the raw water, and a "Contraflo" de-aerator for the treatment of all water passing to the boilers. The evaporator obtains its steam supply at a pressure of 30 lb. per sq. in. absolute through an 8-in. bore bleeder connection from an intermediate stage of the main turbine, and under normal working conditions vaporises 3,500 lb. of water per hour. The vapour is condensed in the low-pressure feed-water heater and enters the condensate system as make-up feed water by being discharged through a steam trap to the condenser. The de-aerator is between the surge tank and the feed pump suction, the steam for the heating element being provided by the feed pump exhaust at a pressure of 10 lb. per sq. in. gauge; under normal full-load conditions it treats 109,100 lb. of feed water per hour.

Provision has been made for utilising the steam generated in a destructor plant, situated on an adjacent site, in the new station; it is intended to connect this steam to an auxiliary heater between the feed-pump discharge and the economiser inlet connection; the condensed steam will be taken through a steam trap to the l.p. heater and thence to the condenser, so that in addition to supplying feed-water make-up, it will also be used for feed-water heating. It is anticipated that when this steam becomes available it will be unnecessary to have the evaporator in service, and an alternative source of steam for the l.p. feed heater will be bled from the main turbine at a pressure of 9.6 lb. per sq. in. absolute, when the evaporator is not in use. The feed system is entirely closed; the two pumps, by J. & G. Weir & Co., Ltd., are turbine-driven, and each is capable of supplying the whole of the feed required under normal conditions; the pump turbines exhaust to atmosphere when the de-aerator is not in use, and excessive back pressure is guarded against by an atmospheric relief valve. When the auxiliary heater is in service, the feed water will be further pre-heated to a temperature of about 220 deg. F. before entering the economisers. Automatic feed regulators of the Crosby type are fitted; the feed heaters are of the floating head type, by Caird & Rayner, Ltd.

The turbine room was designed to house two sets ultimately; one set has been installed by the General

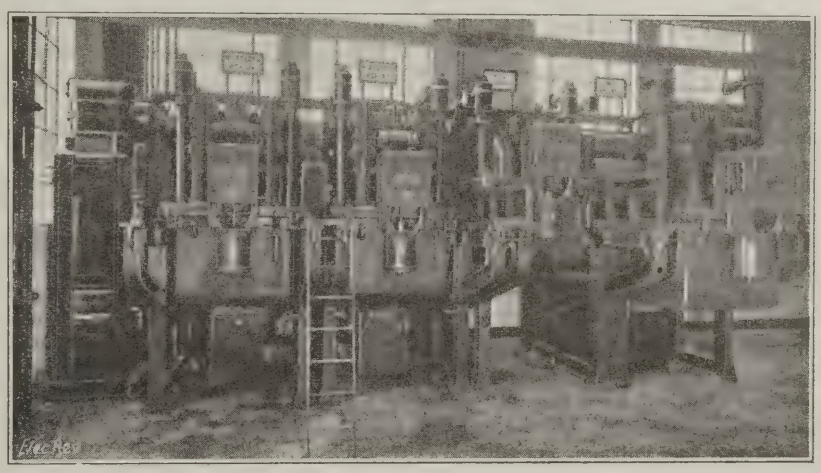

Fig. 6.—The 6,600-Volt Switchgear.

Electric Co., Ltd. Its output is 10,000 kW at a power factor of 0.8 (or 12,500 kVA), 6,600 volts, three-phase, 50 cycles. The turbine is of Fraser & Chalmers' standard high-pressure 3,000-r.p.m. design, and it

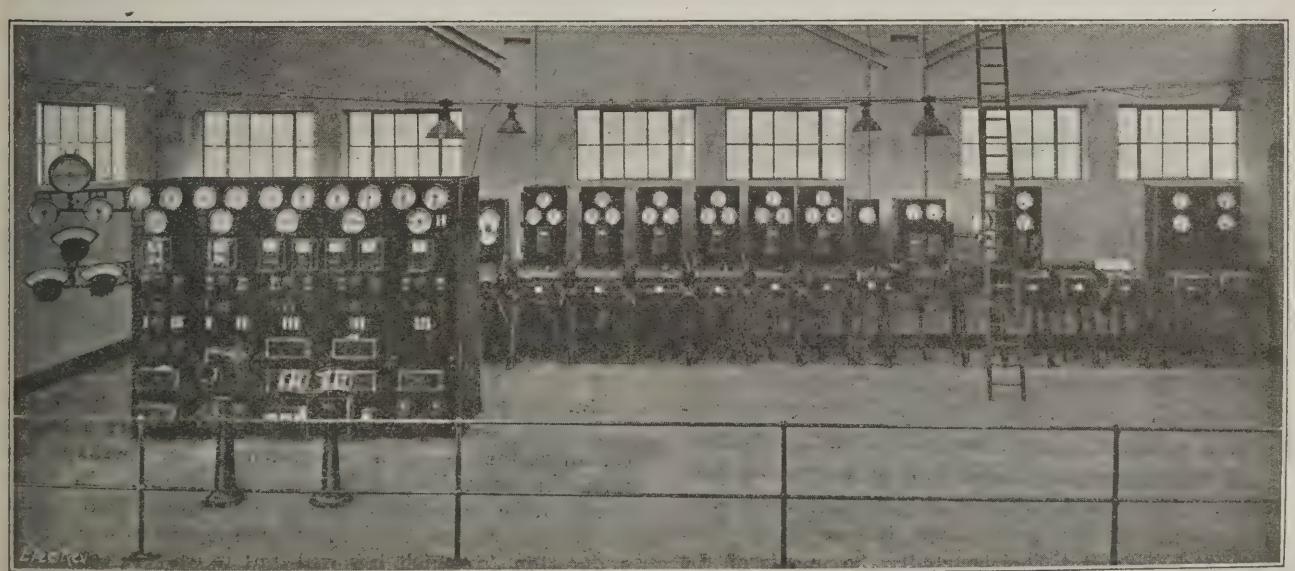

Fig. 7.—Station Control Gallery: E.H.P. Board on Left, House-service Board in Background.

operates at a steam pressure of 300 lb. per sq. in. and a total temperature of 700 deg. F.

The generator is capable of carrying a 25 per cent. overload for two hours; its stator, weighing 40 tons, was cast in the foundry at the G.E.C. Witton works; mica insulation is used throughout the stator, and a totally-enclosed system of ventilation has been adopted, the air being circulated by means of external fans driven by a G.E.C. motor of 110 h.p. in the basement, with a surface cooler through the tubes of which the condensate and make-up feed water is passed.

The surface condensing plant was manufactured by Vickers, Ltd.; of the "Contraflo" type, it has a cooling surface of 14,500 sq. ft. and maintains a vacuum of 28 in. at normal load. The circulating water pumps were supplied by the Mirrlees Watson Co., Ltd., and have a capacity of 9,000 gallons per minute, with water at an inlet temperature of 75 deg. F.; the motors are each of 150 h.p., 415 r.p.m., squirrel-cage type, and the auto-transformer control gear is mounted at one end of the pump house in the form of an industrial panel, provided with busbars and isolators, by Brookhirst, Ltd. The smaller pump motors in this section are of the "Metrovick" squirrel-cage type with auto-transformer starters.

The main 6,600-volt switchgear in the new station comprises six "Metrovick" electrically-operated oil circuit breakers of the metal-clad type with duplicate busbars. A field control pedestal and a neutral earthing cubicle are provided for the alternator; no earthing resistance is provided, and the neutral is connected solid to the earth plate outside the station.

The breakers are of the K4 type, and each has a disruptive capacity of 500,000 kVA; Merz-Price balanced-current protective gear has been provided for the alternator and the station auxillary transformers, and balanced-voltage protective gear for the feeders, with a three-pole overload relay on each of the two feeder groups, having an inverse time characteristic with an adjustable definite minimum time of operation for discriminating. The telegraph equipment is of the Chadburn type, and the loud-speaking telephones by Graham & Co.

Each of the two "Metrovick" transformers is capable of dealing with the total auxiliary plant load; each has an output of 750 kVA at a power factor of 0.8, and the low voltage is 450 V three-phase, with 3 and 6 per cent. tappings up and down on the high-tension side; they have been erected outside the station.

The l.p. switchboard was supplied by George Ellison, and is divided into three groups: all switches are of the draw-out type with single busbars. One group of ten panels is for the a.c. equipment and lighting, the second group is a three-panel equipment for the three-wire d.c. supply, and the third group is a two-panel equipment for the battery supply.

For the pulverised-fuel plant and boiler house the motors were supplied throughout by Veritys, Ltd., and range from 1½ to 80 h.p.; both slip-ring and squirrel-cage types are represented for use on the three-phase system, as well as d.c. machines for use where variable speed requirements are necessary. For the forced- and induced-draught fans and Bailey water screens, the motors were supplied by G.E.C. Brookhirst switchgear is employed. The electrical equipment for the Babcock and Stothert & Pitt cranes is of "Metrovick" make. The lighting of the turbine and boiler houses has been effected by means of Benjamin dispersive fittings carrying high-candle-power gasfilled lamps; various alleyways and passages have been illuminated by smaller lamps in water-tight fittings.

All motors with their control gear exceeding 45 h.p. are connected up with paper-insulated, lead-covered, single-wire-armoured cables supplied by Glover and Co., Ltd. For motors below 45 h.p. and for the whole of the lighting circuits, the "Maconite" system has been employed, single-core cables for lighting and four-core cables for motors having been supplied by the Macintosh Cable Co., Ltd.; the fourth core has been utilised for earthing the frames to the earthing bus which encircles the station on every floor, and is thence connected to the earth plate. The wiring has been carried out by the Alliance Electrical Co. The distribution boards controlling the sub-circuits were supplied by Parmiter, Hope & Sugden, Ltd., and a lift is being installed between the basement and the bunker levels by Waygood Otis, Ltd.

The main interconnecting cables between the old and new stations are of the paper-insulated, lead-covered and served type supplied and laid by Glovers, Ltd.: there are four, each having a cross sectional area of .35 sq. in., laid in Sykes earthenware ducting supplied by the Albion Clay Co., Ltd. A pilot cable is provided with each main feeder for protective purposes and connects with the Merz-Price gear at both ends.

In conclusion, it may be noted that in 1908 an arrangement was entered into with the neighbouring borough of Stepney for linking the e.h.p. systems of both undertakings. Subsequently the boroughs of Hackney and Shoreditch joined the link, with the result that for many years this interconnected group of undertakings has sold energy at average prices which are amongst the lowest in London.

The Ideal Wiring System.

A comparison of the several wiring systems that are available, with a view to deciding which, in the author's opinion, approaches nearest to his ideal for ordinary domestic wiring.

By H. R. TAUNTON.

IN a recent issue of the Electrical Review a layman voiced his bewilderment at the multiplicity of wiring systems offered him by competing contractors. He echoed what was probably the secret bewilderment of the contractors themselves. Each would naturally extol wholeheartedly the merits of the particular system he put forward—put forward largely for the sake of a "different" talking point—but while his praise might be temporarily sincere, it would inevitably be biased by the underlying consideration of competitive cost.

But suppose he were considering the wiring of his *own* house, and, further, suppose expense were a minor consideration—a wild supposition, but perhaps an uncle in Australia has left him a fortune. In other words, if he were unfettered by conditions, what would be his own choice, his ideal wiring specification? It is a question on which few will find it easy to come to a definite decision; and the eventual decisions would make an interesting symposium—if one could ensure a symposium of contractors only, uninfluenced, directly or indirectly, by the contributions of makers' representatives, each with his little axe to grind.

My own ruminations on the question have been clarified into the present article, and in their course have probably reflected the general trend of the more or less indefinite ideas of most contractors of any experience, however few may be found to agree with my personal conclusion.

When I was first introduced to a "married joint"—almost unknown to the modern wireman—a quarter of a century ago, the one popular system of house wiring was casing and capping, with compo. bends. Conduit was in its infancy, and for heavy work screwed gas-barrel with special cast-iron boxes was commonly employed, a clumsy, expensive, but quite efficient forerunner of heavy-gauge conduit. Concentric systems were known, and various forms of armoured cable were already on the market; and there were, of course, any number of freak systems used by individual contractors, which have died a natural and unregretted death.

One of these, which I often came across in Scottish country houses, had certain merits. It was the speciality of the late Mr. R. F. Yorke, and consisted of a single v.i.r. wire run in compo. tubing with a bare-wire earthed return. We were less critical in those days, and its obvious merits of simplicity and economy appealed to me—until I happened carelessly to handle a terminal while standing on the damp floor of a battery room.

The present legion of "surface" systems were, I think I am right in saying, unknown twenty-five years ago. Ordinary single and twin lead-covered wire was, of course, in use—usually without any attempt at bonding—but the first special house-wiring system of that kind which I can remember, I came across in Dublin in 1902 or 1903. It was made, I think, by the B.I.W., and consisted of flat conductors, paper-insulated and lead-sheathed. In such installations as I saw, no attempt had been made to seal the ends; and in the humid Irish atmosphere some of the later tests must have been interesting!

The next landmark in my wiring experience, apart from the gradual popularisation of simplex and similar conduit systems, was the introduction of Stannos. I think it must have been one of the earliest of the practical surface systems. In pre-war years I wired a number of London police courts in Stannos, to the specification of the Scotland Yard architect, and it certainly made a neat and workmanlike job, provided the work was done by men with some experience in its handling.

Since the war, surface systems galore have been marketed. Every cable maker—almost every electrical manufacturer—has managed to extract from his advertising man something novel in the way of nomenclature, and then produced something not quite so novel in the way of wire to back it up. (A contractor, with a little jointing, could almost wire a six-room house with his accumulated samples.) It is as impossible as it would be invidious to name all the various makes from which the modern contractor can make his embarrassed choice; and equally is it impossible to discuss them all in detail—and quite unnecessary: they are all much of a muchness, with a few exceptions which, in striving after originality, hardly escape a certain freakishness. The difference between the best and the worst of them is the difference between Tweedledum and Tweedledee. And from one point of view the same can be said of any wiring system, from the flex-and-button system favoured on the Continent to the massive ironclad system on which the Admiralty lavishes the taxpayers' money.

That is not the paradox it may at first sight seem. For electricity is so safe, wiring for safety is so simple, that almost any conductor, insulated and protected in almost any way, will, *if properly installed*, give a margin of safety infinitely higher than is attainable with gas or any other illuminant. I should doubt if electrical fires are markedly more common in France than they are here, though French wiring methods would give spasms to the meticulous gentlemen who draft the I.E.E. wiring rules. The truth is that our rather fussy regulations still too much reflect the ignorant awe with which the novelty of electric lighting was regarded by our Victorian ancestors. They are conceived too much in the spirit of the red flag which so long handicapped the progress of the motor-car.

A careful workman can make a wiring installation safe with any system; just as a slovenly man with the most gilt-edged one can contrive a potential volcano. All the twelve dozen rules of the Institution can never take the place of care and commonsense; nor can the mere multiplication of regulations close every loophole against the unregulated whims of Fate. Their only tangible result is a needless handicap to the popular extension of the uses of electricity.

In short, one system is as good as another, once it is properly erected, within reasonable limits, of course, and under normal conditions. I am not trying to maintain, for instance, that bare-wire on insulators, excellent under the high roof of a workshed, would be equally so along the skirting of a bathroom. I am only looking at the question now from the point of view of safety—safety from fire, shock, or breakdown—and disregarding for the moment the less important points of permanency, flexibility, convenience, appearance, and so on. From that point of view, the one superlatively important point of view, the true criterion by which any system should be compared with its rivals is the degree to which it reduces the possibility of poor workmanship producing dangerous results.

A system which can be made safe by the ordinary skill and care of the average wireman is therefore to be preferred to one which needs the handling of a master craftsman; and by the same reasoning, one which only gross clumsiness and negligence could make dangerous would be better still, and so on, towards the unattainable ideal of "foolproof." Despite the optimism of switchgear makers, "foolproof" is an absurd interloper in the electrical dictionary. There is nothing foolproof in this world. You might think a common brickbat was—until somebody dropped it on your head!

If, then, we examine the more popular systems of wiring from this standpoint—the scope they give to faulty workmanship—and at the same time glance at their merits and demerits on minor points, we shall, I think, be able to come to something like a definite conclusion. Undue weight given to these minor points—appearance, adaptability, &c.—might lead to widely differing conclusions; but if "safety first" (the average expectation of safety when erected by ordinary workmanship in normal conditions) be made the acid test whereby to judge competing systems, the issue will be greatly simplified.

To analyse all the possible systems that are in use to-day would be an impossible task. Many of them differ only in their trade name; eliminating these and the freaks, and the systems designed for special conditions, the remainder can be grouped in half-a-dozen classes:—

a. Heavy-gauge screwed conduit, more or less completely ironclad from main switch to fitting—generally "less"—it is rare to meet an installation in which the logic of the system does not lapse at a wooden fuseboard or a ceiling block or the like.

b. Light-gauge slip conduit, with or without continuity fittings of all degrees of complexity and inefficiency.

c. Casing and capping, wood or metal—often with the addition of metal or rubber bends.

d. Twin or single wires, metal-sheathed—usually some form of lead alloy. This includes the bulk of the "surface" systems, in which wires are clipped directly to surfaces without other mechanical support or protection.

e. Cab-tire, similar to the above, but with a sheathing of hard rubber instead of metal.

f. V.i.r., enamelled, or bare wire run on insulators or cleats.

It is safe to say that 99 per cent. of to-day's buildings are being wired on one or other of these six main systems. As, however, we are here concerned only

with domestic wiring, we can eliminate *f*, which, though often the best possible system for factories and similar buildings, where it can be run out of reach, is hardly suitable for a drawing-room. It is true that many a house has been, and is still being, wired on the "threaded-joist" principle, with unprotected v.i.r. wires under the floors. No doubt consulting engineers will shudder at the thought of it, but there is really no reason why such wiring should not be safe and satisfactory if carefully done. Logically, v.i.r. wires touching wood only where they pass through joists should be even safer from fire risk than similar wires touching wood throughout the length of a wood casing system. There is here at least a suggestion of a possible approach to the problem of house wiring for the masses. However, it is not a system which a contractor, regardless of expense, is likely to choose for his own house, so we can dismiss it with the rest of *f*.

We can also dismiss system *b*—light conduit. Any merit it has except cost, which is not here in question, is obviously possessed in greater measure by *a*—heavy gauge—for which it is admittedly no more than a cheap substitute, although it probably rivals *d*—"lead-covered"—as the most popular of wiring systems.

I think, too, we can dismiss without much discussion *c*—casing and capping. Metal—usually sherardised steel—casing is little heard of to-day; nor is the more common wood casing used much by up-to-date contractors, except in special situations. Its neat erection needs a joiner's skill, which the modern wireman rarely aspires to. Its bulk makes it unsuitable for concealed work and often unsightly for surface work. In dry situations it has certain electrical advantages, and its fire risks are probably less than those of a poorly-earthed metal system. On the score of mechanical protection it is at a certain disadvantage; though in a private house that is a minor consideration. Its expectation of safety, given average skill in erection, is largely dependent on the care taken to keep wires apart at bridges, tees and angles, and on the avoidance of joints, to which it is rather a temptation. It is indeed a method best associated with the old tree system, where joints were a commonplace. The average wireman of to-day cannot be relied upon to make the sound soldered joints of his predecessor.

Despite its many good points, therefore, casing and capping cannot, in ordinary circumstances, be considered as in the running for to-day's ideal-system stakes. We are now left with three claimants only: *a*, heavy gauge; *d*, "lead-covered"; and *e*, cab-tire; and it will probably be conceded that most of the best domestic work of to-day is carried out on one or other of these three systems. In our search for the ideal, then, they require examination in closer detail.

Heavy-gauge conduit is the pet of the consulting engineers and, without question, it is the best system for most factories, public buildings, offices, and the like, where mechanical protection against accidental or malicious damage is an important consideration. It is, however, too often specified for factories where the less pretentious and very much less expensive system *f*—open wiring on insulators—would be really preferable; and it is, of course, unsuitable for very damp or corrosive atmospheres. In this article, however, we are only discussing domestic installations, and in them, as I have suggested above, mechanical protection becomes a question of quite secondary importance. I think, personally, too much stress is laid in wiring rules, specifications and practice on the necessity of protecting wiring—in private houses—from possible injury.

Consider the average domestic installation. If the wires are run on the surface, how are they in the least likely to be damaged, accidentally or wilfully, unless perhaps in an ill-regulated nursery? If the wires are concealed, how is a nail—the only probable cause of disaster—likely to reach the bulk of them, run below floor-boards? The wiring to plugs is usually protected by the skirting, and that to switches is usually run in an angle or by the architrave of a door, where nobody but a lunatic would want to drive a nail. There only remains the wiring to rare bracket points, in rooms so old-fashioned as to lack a picture rail. Certainly the aberrations of human intelligence call for some protection here—but not for armour-plating. To encase the whole wiring of a house in thick steel for the sake of protecting a few feet of wire against one chance in a million is like wearing a "tin hat" against the chance of the "foolproof" brick mentioned in an earlier column; or like a native of the Sahara living perpetually in a diving suit lest he be caught in the rain!

For domestic wiring, then, the mechanical advantages of heavy-gauge conduit are beside the point. Another great claim for the system is that it is "flexible"—that new wires can be pulled in and out when necessary for repairs or extensions. But how often is it necessary in a private house? And how seldom is it possible in practice! It presupposes a reasonable margin in the sizes of the pipes and an adequate number of accessible inspection boxes, ignoring the hazards of bad judgment in erection—to say nothing of the influence of competition. It also ignores the difference between handling old wires in old conduit and new wires in new conduit, and the possibilities, in repair work, of broken wires, stripped insulation and jamming. In short, so far as house wiring is concerned, the whole claim is a weak one. Actual disadvantages of conduit for domestic work are its unsightliness on the surface and its bulk if concealed, entailing heavy cutting away if rusting through the covering plaster is to be avoided.

(To be concluded.)

The Landlord and Tenant Bill.

New Rights for Traders.

By W. ERIC JACKSON, LL.B., Barrister-at-Law.

THERE seems little doubt that a certain amount of disappointment will arise over the terms of the new Landlord and Tenant Bill now before Parliament. Such disappointment is inevitable, not because the legislature does not desire to satisfy the reasonable demands of traders who are lessees, and whose misfortune on being ejected from their premises at the expiration of their leases is apparent, but because in many cases legislation cannot cover or avoid all the difficulties of the question.

It has long been felt that the iniquitous system whereby landlords, on the expiry of a lease, have been able to hold tenants to ransom by forcing them to pay extortionate sums for a renewal of a lease, ought to be abolished. But on the other hand, if every tenant is to become his own freeholder or, what is almost the same thing, be able to demand perpetual renewal of his lease, development and reconstruction of property will become impossible unless local authorities are given further powers to regulate building and town planning.

The root causes of the contention over leasehold reform seem to be (*a*) the increased values of land at the end of the lease, and (*b*) the covenant to hand over to the landlord the premises in a good state of repair.

The Landlord and Tenant Bill deals with both these points in a limited way. In so far as the increase in the value of the premises is due to the tenant's business activities, whereby a goodwill has attached to the property, the landlord ought not to make any capital out of it. But increases in land values arise from numerous other causes—for example, change in the character of the district—and if the value increases from such a cause and not from the tenant's business, the landlord is surely entitled to this rather than the tenant, just as the owner of any movable property of value is entitled to any increase in its market value.

In order to see how the Bill proposes to deal with these questions, a review of its terms is of interest. The Bill was not debated as was intended on April 4th, and doubtless the impending Budget discussions will cause the Bill to be postponed in its second reading for some time. Traders have therefore a useful opportunity meanwhile of acquainting themselves with its proposals, and of making any criticism they think fit.

The principal part of the Bill deals only with premises used for trade or business in England and Wales. In the case of premises used partly for business and partly for other purposes, the provisions in question apply only so far as the business part of the premises is concerned.

The rights of a tenant under the Bill are divided into two classes: (*a*) in respect of improvements to the property executed by the tenant, and which have increased its value, and (*b*) as regards loss of goodwill on quitting the tenancy.

Take class (*a*) first. The Bill only covers those improvements done after the Bill becomes law. The suggested date is September 30th, 1927, but will very probably be later than that. Accordingly, tenants who up till now have spent money on improving their premises will get nothing for their expenditure when their leases expire. To many persons this may appear a defect in the Bill.

After the Bill becomes law, any tenant who desires to make an improvement for which he may afterwards obtain compensation, must either get the consent of his landlord or, if the landlord objects to the proposed improvement, obtain a certificate from the appointed tribunal. The tribunal will only grant a certificate if it is satisfied that the improvement is reasonable. The landlord can avoid a certificate by undertaking to do the improvement himself in consideration of a reasonable increase of rent.

So far, then, tenants will have the power to prevent landlords from refusing reasonable improvements and to safeguard themselves from providing improvements entirely at their own expense for which the landlord will benefit.

The amount of compensation will be assessed at the expiry of the lease, and will in no case exceed the capitalised value of the increased letting value due to the improvement, or the cost of executing the improvement at the date when the lease expires.

A point of difficulty is created in the case of premises which are to be demolished or rebuilt in an altered form after the lease has expired. Obviously, if a tenant executes structural improvements, these will be of no value when the premises are demolished. Such cases will have to be carefully considered, and Section 1 (3) of the Bill goes so far as to provide that if the improvement will have no effect on the value of the property after demolition no compensation shall be payable to the tenant.

Somewhat similar provision is made later on in the Bill with regard to loss of goodwill. Where premises are to be demolished or altered, the tenant will be in the same position as now, and will have to leave his premises with no compensation. Of course, there are cases in which an improvement or goodwill will not be affected by rebuilding or only affected in a limited way. For example, a tenant may incur paving or drainage expenses. Such expenses will enure to the landlord's benefit after rebuilding. And if a shop is pulled down and rebuilt as a shop, goodwill may attach to the new premises by reason of the old business, but not if the new premises are converted into offices or a kinema. The Bill provides for the taking into consideration of all cases of this kind, but the whole basis of compensation is to be found in the answer to the question: What benefit does the landlord get by reason of the tenant's acts or business? If no benefit (as in the case of demolition), no compensation.

As regards goodwill, the problem is dealt with on the same basis as above, but the tenant's rights and the landlord's rights are a little more complex. The tenant, on claiming for loss of goodwill, may take the case before the tribunal. He will only be compensated for the increase in value of the premises due to his goodwill, and then only so far as that value enures to the landlord's benefit.

The landlord may meet the claim by offering a renewal of the lease on reasonable terms or a sale of the freehold at a fair valuation. Such terms or valuation will include any increase in value not due to the tenant's goodwill, as where the value has gone up owing to changes in the district.

The tenant can, as an alternative to claiming compensation, demand a renewal of the lease on reasonable terms. He can only make this demand if he shows that he is a suitable tenant and that no money compensation would adequately compensate him for loss of goodwill.

The landlord, in reply to the demand for a renewal, can avoid a new lease by showing that he wants the place for occupation by himself or a son or daughter, or that he wants to develop or reconstruct the property, or that a new lease would retard development of other property and be contrary to good estate management. In such cases the tenant will not get a new lease, but will be thrown back on his claim for compensation. It is somewhat unfortunate that the foregoing provisions are all applicable to business premises, but are not applicable to premises occupied by professional men.

The remaining part of the Bill deals with all tenancies and attempts to tackle the "covenant to repair" problem by enabling all disputes over the amount claimable for non-repair to be referred to the tribunal.

The exaction of money payments by landlords for granting a licence to assign, sublet, alter the user of the premises or execute improvements is expressly forbidden by the Bill. Consent to an assignment or subletting or improvement is not to be unreasonably withheld. The landlord may, however, claim, in the case of improvements or alteration in user, for any diminution in value caused.

It should be mentioned that the Bill is one of three dealing with similar matters. Two have been presented by the Liberal party, and although similar in some respects do not entirely agree with the Government proposals (No. 2 Bill). The fate of the Liberal Bills is doubtless assured in view of the Government Bill, but the existence of these opposition proposals makes it evident that by no means are all minds agreed on this rather involved question, and much dissension is bound to arise.

Electric Vehicles in New Zealand.

The annual report of the Christchurch (New Zealand) Corporation states that the electric-vehicle depôt offers charging and garaging facilities for all sizes of electric vehicles, from runabout cars to 5-ton lorries. Rates are quoted covering charging, watering, and general care of the batteries, and, in addition, the garage staff is able to carry out any repairs required to the vehicles. The number of vehicles at present in the garage is 43. The flat nature of the city and surrounding districts promises well for the future development of the electric vehicle in Christchurch.

Reducing Selling Costs.

Some examples of modern practice in the pursuit of economy and efficiency.

By A. J. SMITH.

THE travelling representative or salesman at one time was regarded in many trades as something between an unavoidable expense (like the rates) and a highly speculative investment which might possibly pay handsomely. The task of selection was frankly admitted to be in the nature of a gamble, in spite of the most careful precautions and preliminary investigations. From all accounts, however, salesmanship is now becoming something in the nature of an exact science, whose principles and practice can be taught, whose exponents work upon lines hardly capable of failure; and it is claimed that the gambling element is consequently entirely removed from this necessary branch of modern industry. Though the writer is not prepared to vouch for the accuracy of the contention, it will be fairly evident from the most casual perusal of the "Situations Vacant" columns during the past few years that a vast change has taken place in manufacturing opinion of what may reasonably be expected of a salesman and what he may expect in return.

Years ago, remuneration of this section of the staff was very usually upon an outright salary basis. It was perhaps a feature of the system that the weeding-out process had to be both drastic and continuous, but not the least of its merits was that it enabled outside staff to be controlled and directed by headquarters exactly the same as the rest of the establishment.

The increasing efficiency of salesmanship, and a growing appreciation of what the trained man could perform, however, brought a modification in the shape of a general change-over to a part-salary part-commission basis, by which the salesman drew merely a nominal fixed salary, depending upon his unaided efforts for the commission necessary to make the post a remunerative one. While increasing the stimulus to exertion, the system lessened to a certain extent the power of direction and control from headquarters.

The next step in increased selling efficiency is very well indicated by the following class of advertisement:—

> "Representative wanted, possessing powerful personality, to market high-grade product made by nationally-known manufacturers. None need apply but thoroughly experienced men who will not be satisfied with less than £2,000 per annum minimum."

It might be explained for the benefit of readers possessing the powerful personality and the wide experience that this is not quite what it seems. Even a sworn affidavit from an applicant that he will on no account accept one penny less than two thousand pounds per annum will hardly help him; nor, if the truth must be told, is the successful applicant at all likely to take home a cheque for £166 at the end of his first month's service. Put into plain English, this class of advertisement is usually a plea from a small manufacturer who on account of a banker's reluctance to increase the overdraft without tangible security is unable to add to his staff on the usual basis, and has perforce to look for a man who will be content to rely for his prospect of remuneration upon a small commission upon sales; "such commission," to quote the legal phraseology of the agreement, "not to become payable until the manufacturer shall have received payment in full." What basis there is for the amount named to be £2,000 per annum is in such cases difficult to discover, for it certainly does not represent the average earnings of half a dozen typical salesmen taken over the last three years according to Income Tax Returns (Schedule "D"), but is a purely imaginary figure which for all the evidence there is behind it might equally well have been stated as £20,000 or £200,000.

Another method of keeping down selling costs which has become increasingly popular of late years is the simple plan of allowing the salesman to pay his own salary out of his own pocket! This is euphemistically described as giving a worker "a stake in the business" or "a share in industry," and is usually presented in the following manner:—

> "District Sales Managers wanted to develop sales of speciality without competition. Salary £500 per annum; investment required, £600."

This plan, to judge by appearances, is a far surer method of raising additional much-needed capital than any financial appeal to the investing public through the usual channels. The drawback from the manufacturing point of view is that it is usually confined to comparatively small sums; £600 is a very common figure, though larger sums up to about £2,000 are occasionally raised in the same way. Regarded from another point of view, the plan has the merit that in addition to obtaining the greatly-desired "stake in the business," the successful candidate can usually obtain a nominal "security of tenure," for a simple calculation will show that even under a definite service contract for a full year the proposition is still a profitable one for the advertiser, who remains £100 to the good at the end of that period, assuming the transaction takes no untoward turn before that time. A study of a few dozen such transactions, however, leads to the conclusion that the remuneration will cease for some reason or another at the end of the second month!

For those who may wish to study the possibilities of this method of making (and losing) money, it might be useful to add that it is not the best or the most business-like application which is most likely to receive attention.

The very latest examples of all make no pretence that remuneration depends upon anything but the unaided work, the financial resources, and the organising abilities of the salesman himself. In this respect, some of the more up-to-date advertisers appear to have profited from a careful perusal of recent reports upon industrial conditions in the United States, where the worker is considered to be entitled to all he can earn. In fact, there are signs that in the Midland manufacturing districts of this country even American selling methods can be improved upon, and the following recent advertisement is quoted to show how a profitable new department may be added to an existing business, or an entirely new undertaking started without financial risk to the owner:—

> "High-class and thoroughly experienced Sales Organiser for new concern selling both to trade and public. Must be prepared to finance his own department, pay his own staff, and make business show a profit. Capital required, £ . . ."

It will be evident from this that our Midland industrialists have nothing to learn from America in selling methods, though one is left with a feeling of slight bewilderment why a modern salesman who is expected to possess the power to launch, sell, and make a profit upon a new product as well as the capital necessary for financing the undertaking should not also be assumed to possess sufficient business acumen to start the new business himself, and take over the profits as well as the risks of the venture.

Wireless Telegraph Communication.

A review of the present position of maritime safety services, commercial communication, and point-to-point telegraphy in view of the proposed modified requirements and regulations to be discussed at the forthcoming International Conference in the United States next Autumn.

By Lieut.-Col. CHETWODE CRAWLEY, M.I.E.E.

(*Continued from page* 594).

(II) Ships' Commercial Services.

THE International Radiotelegraph Convention of 1912 laid down regulations for dealing with ships' commercial services, as well as with the safety services which we have already considered. Safety and commercial services have developed extensively since 1912, the former because all but the smallest ships are now fitted with wireless telegraph plant, and the latter because, in addition, all the larger ships are now capable of working on continuous waves over great distances.

Spark Waves.—By the 1912 Convention all ships fitted had to be able to signal for commercial purposes on the 600-metre and the 300-metre spark waves, the former being used also for distress communications. In addition, an 1,800-metre wave was detailed for long-range working, but this wave has never been used to any great extent. It was intended that a good deal of traffic should be conducted on the 300-metre wave, but, except in the case of small ships, where owing to the smallness of the aerials available the 300-metre wave is suitable technically, it has never been used to any appreciable extent as with larger ships' aerials it is not so good for range; and besides, all ships and coast stations normally stand by on the 600-metre wave for distress purposes. As the 300-metre wave is now within the broadcasting band of all countries, it has been nearly universally abandoned as a ships' wave, and so far as this country is concerned a 220-metre wave is used instead for communicating with small ships, such as fishing vessels, &c., but compared with the rest of ships' traffic the work done on this 220-metre wave is negligible. In this country we are using an 800-metre spark wave to reduce the congestion on the 600-metre wave, but the 800-metre traffic, so far, is small. In other countries use is also being made of waves between 600 and 800 metres, but such waves tend to interfere with both the 600-metre and the 800-metre waves. Waves above 800 metres interfere with waves used for aircraft communication, and waves between 600 and 250 metres interfere with the broadcast services. The allocation of spark waves for ships' traffic, in addition to the 600-metre wave, will be an important question for consideration at the International Conference. In this country the 800-metre wave as an alternative to the 600-metre one is available at the stations at Lands End, North Foreland, Fishguard, Wick and Seaforth, and the 220-metre wave is available at the Humber station and will be employed at other stations in due course.

It is generally recognised that the real solution to the congestion on the 600-metre wave is to transfer the bulk of ships' traffic to continuous waves so as to leave the 600-metre wave free for safety signalling and, possibly, messages on the service of ships. This is a solution which will no doubt be brought about somewhat gradually owing to the expense of fitting continuous-wave sets in ships already fitted with spark sets, and the first step is likely to be the gradual supersession of spark sets by interrupted-continuous-wave sets which will pave the way for the use of continuous waves for traffic purposes.

About 65 per cent. of the traffic between ships and the shore in this country is conducted with the Post Office coast stations on spark waves, the remaining 35 per cent. being conducted on continuous waves with the Post Office station at Devizes. A very small amount of spark traffic is also conducted by the railway companies between their cross-Channel boats and their stations at Parkeston Quay, Heysham, Newhaven, and Folkestone Harbour, the two former using an 800-metre wave and the two latter a 700-metre wave.

Continuous Waves.—At present about 320 British ships, or 10 per cent. of those compulsorily fitted with wireless telegraphy, carry continuous-wave installations, and communicate with Devizes up to a range of about 1,500 miles. In addition, 50 per cent. of the British ships compulsorily equipped can receive continuous-wave signals, though they are not fitted with continuous-wave transmitters, and the number of these ships is rapidly increasing. These two classes of ships can receive messages from the Post Office station at Rugby, which broadcasts news and sends ordinary traffic to ships all over the world at scheduled times on an 18,740-metre wave.

The Devizes station transmits on 2,100 and 2,400-metre waves, and receives on 2,100, 2,300, and 2,600-metre waves. Devizes is operated from a station at Burnham-on-Sea, where the reception is carried out, and from which there is direct land-line connection with the General Post Office in London.

Trials have been carried out with high-speed signalling apparatus, but very few ships are fitted for high-speed operation, and, so far, hand working only is carried out here, though on the other side of the Atlantic the few ships which are fitted sometimes resort to high-speed operation when clearing large batches of telegrams.

The Burnham station is fitted with directional receiving aerials in order to reduce interference, and similar arrangements are now being made at such of our spark coast stations as are not already fitted.

Experiments in short continuous-wave communication between ships and the shore are being carried out here and in other countries, but no commercial services are yet in operation. The Devizes station is being fitted with a short-wave set. A new Post Office station to replace Devizes is being erected at Portishead. This station will also be equipped for short-wave, in addition to long-wave, working.

Continuous-wave services were not of course considered in the 1912 Convention, and the wave bands to be allocated to these services will be considered at the forthcoming Conference.

Charges.—The normal charge for radio-telegrams to and from Devizes, or to and from any of our 11 spark stations situated round the coast, is 11d. a word, made up of 6d. for the land station, 4d. for the ship, and 1d. for the inland telegraph service. There is also a special rate of 5½d. a word for Press telegrams. The normal

range of Devizes is about 1,500 miles, and that of the spark stations about 250 miles, much greater ranges are frequently obtained. Short-voyage ships, about 450 in number, are given reduced rates of 3½d. or 5½d. a word according to the service on which the ship is engaged. About 3,200 British ships, in addition of course to many foreign ships, make use of all these services for commercial traffic, and this traffic has just about doubled since 1920, when it was laid down that for safety purposes passenger ships and ships of 1,600 tons gross tonnage or over, registered in Great Britain, must be fitted with wireless telegraphy. About two-thirds of this traffic is conducted by the spark stations and one-third by Devizes on continuous waves.

Last year a broadcast service to ships twice daily was opened from the Rugby station at 1s. 6d. a word, including 4d. for the ship charge. This service is available for some 2,000 ships fitted with continuous-wave receivers in any part of the world; the ships cannot of course reply to Rugby direct, but can do so through coast stations abroad, whence the replies can be forwarded to this country by the ordinary telegraph and cable. Rugby also broadcasts Government news messages free of charge three times a day to ships and stations all over the world. Messages can also be sent by the ordinary telegraph route to coast stations abroad and thence by wireless to ships. Radiotelegrams for ships in plain language, code or cipher can be handed in at any postal telegraph office in the country.

The station must be specified in the address of telegrams for Rugby or for stations abroad or for short-voyage ships at the reduced rates. In other cases where the sender is not sure of the station the word "wireless" may be used on the message form in place of the station's name, and the appropriate station will then be selected by the Post Office.

It was laid down in the 1912 Convention that as a general rule a ship should call up the nearest coast station and indicate its position and the next port of call so as to facilitate the disposal of traffic. This however is not always done, so that our coast stations invariably endeavour to get into touch at once with any ships for which they have traffic. The 1912 Convention provides for the retention of a message at a coast station for a period of eight days, or advice of undelivery earlier if it is known that the ship has passed out of the station's radius of action. In practice it is very seldom necessary to retain a message for such a lengthy period, as the object aimed at is early disposal or alternatively early advice of non-delivery.

Operators.—The qualifications required by ships' operators were laid down in the 1912 Convention, and the classes of operators to be employed on the different classes of British ships were laid down in the Rules of the Merchant Shipping Act of 1920. Amendments in the qualifications and classification of operators will, no doubt, be discussed at the forthcoming Conference. There are some 4,000 operators on British ships and about 85 per cent. of these are in ships which carry only one operator. The large British passenger ships must carry at least three operators for safety purposes, but more are carried voluntarily in the great liners which deal with a considerable volume of wireless traffic. The position of operators on board British ships up to December last was somewhat anomalous, but has now been brought into line with that of the rest of the ships' officers. The rates of pay of operators with more than three years' service vary from £13 to £20 a month, according to the class and tonnage of the ship on which the operator is serving.

(To be continued.)

Illuminating Engineering Society, U.S.A.

The twenty-first annual convention of the Illuminating Engineering Society is to be held in Chicago from October 11th to 14th, inclusive, with headquarters at the Edgewater Beach Hotel.

Correspondence.

Correspondents should forward their communications **as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

Power Transformer Operation.

In your issue of the 15th inst. there is an article under the above heading dealing with transformer protection. The author, although he rightly recommends the earthing of the neutral on the l.p. side, gives fig. 2 as the correct diagram of connections for M.P. gear on a star-star transformer. The arrangement shown in that diagram will **not** balance on "straight-through" earth faults; as the current in such cases returns by the neutral on the l.p. side and by the other phases on the h.p. side (the neutral being insulated), it is obvious that balance cannot be obtained with star-star connected current transformers. The secondaries of the latter should, of course, be connected in delta; in fact, the standard rule for all M.P. circulating-current transformer protection is to have star-connected secondaries with delta transformer windings and *vice versa.*

Manchester, *April 20th*, 1927. **G. L. Porter.**

Cheap Electricity.

I duly noted your review of Messrs. Ruston & Hornsby's pamphlet entitled "Cheapest Electricity—How to obtain it," on page 605 of your issue of April 15th. This is, of course, a condensed version of a pamphlet by Mr. W. C. Mountain entitled "A Word in Favour of the Independent Power Plant." Mr. Mountain specialises in advising on small power plants—and hence is not quite as disinterested as the publishers would apparently wish one to think. When the original booklet first appeared, a marked copy was sent to me by one of the leading engineers of the country, who was highly amused at its speciousness. I have a high respect for the author and his honest belief in his own views, which are shared by others, as is indicated by several papers that have been read lately before various institutions and associations.

The object of this letter is not to attack any of these gentlemen, but rather to draw attention to the great difficulty there is in refuting the arguments put forward in favour of the small independent plant. I agree that there are bound to be special cases where the conditions are such that the small independent plant has advantages over the central undertaking, but they are very few. I may say that I have been an advocate for some years of plants of this nature, for use by power companies, as a temporary measure for the purpose of building up loads, until such a time as it is worth running a distribution line to a new district. Mr. C. Bell Walker has refined this idea, and full-automatic heavy-oil engines, three-phase, storage-battery plants operating at 50 cycles, 400/230 volts (*i.e.*, the same kind of current as the future central-station supply) are now available for the purpose. As a matter of fact, the advocates of small plants could make their case even better, if they made them automatic, as then much of the very costly attendance would be eliminated.

In this particular pamphlet (and also in the various papers that have appeared on the same subject) it will be noted that in no case are *all* the costs included. In other words, the acid test is that current could not be profitably supplied to another independent party at anything like the figures quoted. After all, taxes, rates, rent, repairs, and other out-of-pocket expenses have to be paid by someone. Then there is the question of the stand-by required to ensure uninterrupted service. The manufacturing business that only looks for 5 per cent. on its capital outlay cannot be considered to be in a healthy state. As a matter of fact, nearly every such business can make a far better return by investing all its available capital in its own line. The power cost is almost always but a trivial proportion of the whole of the manufacturing expenditure. Again, in busy times, there is a shortage of power. In slack times the overhead charges of the small power plant mount up excessively per unit generated. It is no use the factory owner persuading himself that his home-generated power is cheap, if a number of what should be generating charges are borne by the works generally. It is natural perhaps that the factory engineer should prefer to have his own generating plant. It is an added technical interest which he thinks also adds to his prestige (incidentally, it increases his worries). Truly, however, the time he expends on this plant could be far better employed in improving factory operations. The adoption of modern quick-costing systems in factories would do much to convince the owner on the point as to the best source of power. It is strange that the independent plant is getting a better run for its money in Great Britain than in almost any other country. Possibly this is largely due to the independent attitude of our race, which seems antagonistic to much co-operative work.

It would do a great deal of good to all branches of the electrical industry if an independent authoritative body such as the Electricity Commissioners could make arrangements to state what are fair rates for charging for current under various conditions in various localities, and so remove much distrust on the part of the user. The latter rarely appreciates that a public utility undertaking, from the very nature of its

business and the publicity to which it is exposed, can never make an extravagant profit. Hence, why should the factory owner extend into another business which cannot be described as lucrative?

I meet many electrical engineers who say that they consider the oil engine good enough for the farmer, and do not see the necessity or advisability of recommending electric motors for his purposes. Still, they would not invest much of their own capital in a company whose object it was to replace the electric motors of the city factory, by oil engines dotted all over the place.

There is much to be said for both sides, yet if factory owners put in their own generating plants, it is very advisable that they should generate the same form of current as the local electricity supply undertaking—as it facilitates getting extra power and, one day, that eventual change-over.

R. Borlase Matthews.

East Grinstead, *April 16th*, 1927.

Electric Water Heating.

Mr. Ross's article in your issue of April 22nd appears to bear out the contentions in my own contribution in that issue. Assuming that his curve is a good approximation, it is clear that there are three periods of peak, namely, from 7 to 9 in the morning, from 11 to 1 midday, and from 5 to 7 in the evening. If the water heater were automatically switched off at all these times it would not affect the maximum load; and with proper thermal storage it would not seriously affect the hot-water supply. Furthermore, if Mr. Ross's 2 kW were increased a little, so as to give a higher temperature in the tank (or, alternatively, if larger tanks were used) a geyser would surely be unnecessary.

J. W. Meares.

Guildford, *April 23rd*, 1927.

I am very interested in the subject of electric water heating, and was therefore glad to see the article by Mr. J. W. Meares in your current issue, although there are several things in it with which I must disagree.

For one thing, he rather underestimates the cost of a time switch, but as he has over-estimated the annual charge for a *good* time switch, the net result is about correct.

I know it is not unusual for the kick about first cost to be given to the time switch, but I cannot see why this should be. The water heater itself is very much more expensive, and these things really cannot be judged by size or we should expect to pay more for a dustbin than for a decent watch. The fact is that the annual charge for the time switch is less than that of any of the other items, and therefore it is the latter which offer the most scope for reductions.

If Mr. Meares's idea of using a meter element were carried out, I do not know that he would find it much cheaper by the time the necessary gearing and switch had been fitted to it, but the point that he overlooks, and I am afraid you also have overlooked in your footnote, is that any temporary stoppage of supply would put the motor out of operation and subsequently cause the switching on and off to be done at the wrong time; this quite bars that type of mechanism where work has to be performed at stated periods.

With the Warren clock, provided the supply station has installed the proper apparatus, it is possible to get correct average time over the 24 hours, but I can see no prospect of this under Mr. Meares's scheme, as the voltage and periodicity certainly do not average out in the course of a day.

I can answer his question as to whether this has been tried out; I know definitely of its having been tried in New York, and I seem to remember its having been tried out in England, but I cannot say where.

We must bear in mind that even a 1 per cent. error means practically 15 minutes in the course of a day.

I think before very long schemes will be started which will meet Mr. Meares's desires and in which the cost of a time switch will not be too serious.

I should like to ask Mr. Meares if he has not allowed for quite twice as much hot water as a small house would require.

Ernest E. Sharp.

London, *April 25th*, 1927.

The Salaries of Engineers.

Referring to your interesting article, "The Ordinary Engineer and his Remuneration," by P.B.E., his reference to the Society of Technical Engineers is not quite correct when he states that the declared object of the Society was to raise the status of the engineer. I distinctly remember the chairman of the first Executive Committee at a public meeting in Manchester saying that we must secure "our shares in the wealth of the industry to which we belong and which we have helped to build up." I feel sure this object enrolled more members than any other, and greater progress might have been made with the Society if the chairman had added: "And with our share in wealth we will undertake our share of the burden of responsibility of control, but we must have a voice in determining that responsibility."

My experience when enrolling members was that the average engineer was more interested in his salary than in his status.

April 23rd, 1927. **S. W. G.**

Electroculture.

We would be very much interested to hear if any of your readers have had experience in the culture of tomatoes by means of electricity. If there are any books available on this subject we would be glad to know where these can be obtained.

Paisley.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

British Industrialists to Visit America.

At the invitation of the Virginia State Chamber of Commerce a party of delegates representing the Federation of British Industries, Chambers of Commerce, and the Chamber of Shipping are sailing to-morrow (Saturday) for the United States. The principal object of the visit is the strengthening of direct trade relations between this country and the Middle-Western States.

Improvement in the Engineering Industry.

At the London conference of the Amalgamated Engineering Union held a few days ago, Mr. J. T. Brownlie, president, commented on the satisfactory reports on the condition of the industry which had been received. Orders of considerable aggregate value had been obtained, and the records of the Union showed a recent decrease in unemployment, the percentage falling from 12.8 in December last to 8.06 at the end of March. It is generally expected that the employers will make an offer representing an improvement upon the 2s. 6d. bonus, with modifications in the overtime and night-shift conditions.

G.E.C. Lighting in South Africa.

Several installations of G.E.C. lighting fittings and "Osram" lamps have recently been completed in South Africa. One of the principal instances is the new town hall at Boksburg. In Johannesburg the new Chamber of Mines building has been equipped with these fittings, and the new Prince's Cinema, Durban, has been similarly provided, almost exclusively, with G.E.C. equipment.

New Belgian Companies.

Under the auspices of the Société de l'Union Minière, a company is being formed in Brussels, with a capital of 60 million fr. and the title La Société des Produits Chimiques au Katanga, to establish works in the Belgian Congo for the electrolytic treatment of copper and the production of sulphuric acid.

La Société Belge-Polonaise de Force et de Traction Electriques is the name of a company which has been formed in Brussels with a capital of 26 million fr., to organise and finance electric power and traction undertakings in Poland.

New French Company.

A new company has been formed at Dax with a capital of 250,000 fr. and the title La Société d'Electricité des Landes, to establish electricity distribution undertakings in the Pyrenees.

Meter Approved.

The Electricity Commissioners have approved of the construction and pattern of the meter known as the Hookham 1907 type, d.c., 2-wire Ah meter, rated from and including 2.5 amps. to 150 amps.

The Anglo-Spanish Commercial Convention.

The *Board of Trade Journal* announces that a supplementary convention revising certain provisions of the Anglo-Spanish Commercial Treaty of 1922 came into force at midnight, April 23rd-24th. This applies reciprocal most-favoured-nation treatment to certain classes of goods which are scheduled. Special allowance is made for British coal, and among other things the 20 per cent. increase in the Spanish tariff imposed in July last year is removed in respect of some goods and reduced as regards others.

Unemployment.

The Employment Exchange returns dated April 11th gave the number of registered unemployed as 1,078,300. This represented an increase of 4,540 during the week, and was 53,910 more than on April 12th, 1926.

Harcourt Lighting Fittings.

We have received from METRO-VICK SUPPLIES, LTD., a series of photographs illustrating examples of installations employing "Harcourt" lighting fittings. They show that these types of fittings are suitable for all kinds of commercial applications

Harcourt Fittings at Barker's.

such as banks, offices, and stores. The one reproduced herewith is a view inside Messrs. John Barker's new building, in which a vast array of small articles is excellently illuminated.

Electric Power in Industry.

The eighth of the preliminary reports upon the 1924 Census of Industry was published as a supplement to the *Board of Trade Journal* dated April 21st; it deals with the paper-making, printing and allied trades. In the paper-making industry the amount of generating plant installed rose from 14,914 kW in 1907 to 32,075 kW in 1912, and 79,032 kW in 1924. The aggregate capacity of electric motors installed was 146,715 h.p. in 1924, as compared with 38,130 h.p. in 1912; power for 38,341 h.p. of the motors was purchased in 1924. The printing and bookbinding trades reported 6,593 kW of electrical generating plant, as against 7,645 kW in 1907. The installed motor-power aggregated 81,514 h.p., power for 70,593 h.p. of which was purchased. In the trades covering the printing and publication of newspapers and periodicals 3,911 kW of generating plant was in use in 1924, as against 2,220 kW in 1907. Electric motors with a total capacity of 56,337 h.p. were installed, power for 55,724 h.p. of which was purchased.

Czecho-Slovakian Tariff Reductions.

Under the recently-signed Commercial Treaty between Czecho-Slovakia and France, which comes into force 15 days after ratification, the duties upon several classes of goods upon importation into Czecho-Slovakia are reduced. As Great Britain is on a "most-favoured-nation" basis with Czecho-Slovakia, the reductions apply equally to goods from this country. The classes affected include steam turbines, electric generators, motors, telephone and telegraph apparatus, electrical measuring apparatus, ignition apparatus, and other, unspecified, electrical goods (except mounted carbon brushes, cooking and heating apparatus, and dry batteries). A full list of the classes involved, with the reduced rates of duty, appears in the *Board of Trade Journal* dated April 21st.

Local Exhibitions.

HAMMERSMITH.—The Electricity Department of the Hammersmith Borough Council has arranged a special electrical display to form part of the exhibition at the Town Hall in connection with the Health Week campaign, which commences on May 8th. The General Electric Co., Ltd., has arranged to erect two stands on which a complete range of "Magnet" household electric appliances will be shown. There are to be frequent demonstrations with such appliances of electric cooking, washing, &c.

CLITHEROE.—The Electricity Committee is arranging an exhibition of electrical apparatus at the Castle, and representatives of neighbouring local authorities have been invited to attend.

MANCHESTER.—At the Better Housing and Housekeeping Exhibition organised by the *Daily Dispatch* at the City Hall, Manchester, an "all-electric" house has been completed adjoining the Main Hall. The electrical installation has been carried out by Messrs. E. O. Walker & Co., Manchester, and the furnishings by Messrs. Waring & Gillow. Vacuum cleaners are exhibited by the C.C.A. (Vacuum Cleaners), Ltd.; the Gem Labour-Saving Device Co., Ltd.; Hoover, Ltd.; Vac-tric, Ltd.; and Thorwash, Ltd. The last company also exhibits electric washers and wringers. Electrolux, Ltd., shows its cleaner and refrigerator, and Frigidaire, Ltd., displays its automatic electric refrigerator. The exhibition will remain open for one month.

MORECAMBE.—An "all-electric" bungalow is a feature of a Spring Trades Exhibition, opened at the Winter Gardens, Morecambe, on April 27th, and which continues until May 4th, under the auspices of the Morecambe Chamber of Trade. Mr. Francis, of the British Electrical Development Association, is giving lectures on the domestic uses of electricity.

Recent Contracts.

The ENGLISH ELECTRIC CO., LTD., has received an order from the Measham Collieries, Ltd., for an electric winder for the Minorca Pit. The winding motor, which is of the 3-phase induction type, will drive the drums through single-reduction, treble-helical gearing, the motor output being 160/325 b.h.p. at 363 r.p.m. Power is being obtained from the Warwickshire and Leicestershire Power Company at 11,000 V, and a transformer with the necessary h.p. switchgear is being installed. The winder will be designed to deal with an output of 122 tons per hour from a depth of 540 ft., the net weight per lift being 48 cwt. Normally, however, coal will be drawn from the 270 ft. level and, in view of there being two working levels, it has been decided to install a double drum winder, one drum being fixed to the shaft, and the other loose, but fitted with a multi-tooth clutch, so that the rope can be adjusted easily and quickly to permit winding from either level. The mechanical parts are being supplied by Messrs. Fullerton, Hodgart & Barclay, Ltd. In addition to the winder a 250-kW motor-generator set has also been ordered from the English Electric Co., together with the necessary a.c. and d.c. switchgear, to provide an alternative source of d.c. power for the plant at Measham Colliery, which at present is being supplied from the colliery power station.

We learn that within the last few days the ELECTRIC FURNACE CO., LTD., has received orders for six Ajax-Wyatt brass melting furnaces, each of 600-lb. capacity, for a French firm, and also a 100-kW resistance furnace for annealing aluminium sheet in Scotland.

Chinese Electrical Imports.

Commerce Reports states that certain sections of China appear to be much alive to the advantages accruing from the use of electrical power. Not only were electric railroads and electric lighting facilities extended during the first nine months of 1926, but considerable business was transacted in motor-driven machinery for buildings and for grinding cereals. As a result, China's imports of electrical equipment, including general supplies and telegraph, telephone, and power-station materials, advanced 17 per cent., while imports of machinery were reduced about 2.5 per cent. During the period January-September, 1926, electrical materials and equipment to the value of 9,044,502 taels was imported through 45 maritime Customs ports, as compared with 7,731,728 taels in the corresponding period of 1925. The Haikwan tael averaged 3s. 6d. in 1925 and 3s. 2d. in 1926.

British Goods in South America.

Speaking at the recent annual meeting of the British Bank of South America, Mr. F. R. S. Balfour said that while there existed in South America a distinct preference for British goods, even at higher prices, there were several factors operating to the detriment of British export trade. One of those was the tendency for the trade to develop between a borrowing nation and the centre affording accommodation. That had happened between the United States and South America, in spite of the former country's tariffs, which had acted in her favour. Again, confidence in British manufacturers was being undermined by the continual industrial disturbances in this country; there was uncertainty regarding delivery. Our prices and freight charges were too high, and placed us at a considerable disadvantage in respect of our competitors. Local manufacturers also had to be contended with. If our connection with South America was to be maintained, the needs of the market must be thoroughly studied by reliable representatives, and suitable, effective propaganda must be pursued.

For Sale.

The County Mental Hospital, Rainhill, Lancashire, has for disposal one 115-kW, 230-V steam-driven, direct-coupled d.c. generating set. Crittall Manufacturing Co., Ltd., has for disposal two Garrett direct-coupled generating sets, condensers and auxiliaries. (See our advertisement pages to-day.)

Trade Announcements.

The Nantwich Electrical Co. has opened premises at 4, Church Lane, Nantwich.

A new company has been formed with the title Canadian Porcelain Co. (British), Ltd.—its registration is detailed in our "New Companies" column this week—to act as exclusive representative here of the Canadian Porcelain Co., Ltd., of Hamilton, Canada, muanufacturers of extra-high-pressure insulators, transmission line equipment, &c. Its office is at 343, Abbey House, Victoria Street, London, S.W.1, and the branch will be in charge of Mr. Geo. M. Duncan, manager of sales for the Canadian Co. and managing director of the new company, and of Mr. Chas. A. Burnier, secretary and sales engineer of the new company.

Messrs. Weight & Bradley, wireless engineers, have opened premises at 14, Cross Street, Reading.

A company known as Lectro Linx, Ltd., has been formed with offices at 1, 2 & 3, Ashley Mansions, Vauxhall Bridge Road, S.W.1, to undertake the exploitation of the "Clix" specialities. Notice of registration appears in our "Financial Section" to-day.

Mr. W. E. Beaver has commenced business as an electrical engineer at 176, Park Road, Peterborough.

The General Radio Co., Ltd., has purchased Radiobats, Ltd., and has thus secured control of an English high-tension radio battery factory producing 7,500 cells per week.

Messrs. Poynter, Griffiths & Co., Ltd., of the Maxim Lamp Works, have increased their capital. Sir James W. Paton, J.P., of Paton, Calvert & Co., Ltd., Liverpool, and Mr. John Baird Walker, of the Fine Cotton Spinners' & Doublers' Association, Ltd., have joined the board—which now consists of these gentlemen, Mr. Thos. Crosby (chairman), Mr. T. H. Griffiths and Mr. J. F. Poynter (managing). The registered offices remain at Canonbury Road, N.1.

Mr. A. W. Saulter has granted a sole licence to Messrs. Hugh Stevenson & Co., Ltd., Manchester, for the manufacture of his patent coiling device.

New Catalogues and Lists.

Power Contracts, Ltd., 138-140, Southwark Street, S.E.1.—An illustrated folder advertising "Batwin" electric motors for many purposes.

The Yorkshire Electric Transformer Co., Ltd., Dewsbury.—A leaflet illustrating an example of the company's pole-type transformers for rural distribution.

Messrs. William Geipel & Co., Vulcan Works, St. Thomas Street, S.E.1.—Two leaflets, describing Ward Leonard "Vitrohm" resistors, for which the company is sole agent for the United Kingdom and the British Colonies, and Ward Leonard theatre-lighting dimmers.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—The "Osram-G.E.C. Bulletin" for April, containing illumination notes, descriptions of "Magnet" domestic appliances, and articles upon "Osram" valves and radio apparatus.

The Hart Accumulator Co., Ltd., Marshgate Lane, Stratford, E.15.—A purse folder containing an attractive pamphlet giving prices and details of "Hart" radio batteries.

The Chloride Electrical Storage Co., Ltd., Clifton Junction, near Manchester.—A photogravure poster (20 in. by 30 in.) illustrating and advertising in a pleasing manner "Exide" high- and low-tension wireless batteries.

Societe des Etablissements A. Foucher, 62, Boulevard Jourdan, Paris, XIVe.—A booklet containing illustrations of machine tools for the book-making and box-making industries.

Messrs. Houghton-Butcher (Great Britain), Ltd., 88-89, High Holborn, W.C.1.—"Houghton's Radio News" for April, containing illustrated descriptions of radio apparatus and accessories and articles on various phases of the radio business.

The Fuller Accumulator Co. (1926), Ltd., Chadwell Heath, Essex.—A showcard, in colours (18 in. by 12 in.) depicting "Fuller" batteries as "The Power Behind the Valve."

The British B.A.G., Ltd., 23, Farringdon Avenue, E.C.4.—Two illustrated and priced catalogues dealing with lighting, heating, and cooking appliances, &c., and a folder advertising the "Lomax" lampholder.

Messrs. Watson & Sons (Electro-Medical), Ltd., Sunic House, Parker Street, Kingsway, W.C.2.—Bulletin No. 81, dealing with the new "Sunic" flat Potter-Bucky diaphragm.

The Drayton Regulator & Instrument Co., Ltd., West Drayton, Middlesex.—An illustrated leaflet describing the "Drayton" pressure recorder.

Ransome & Marles Bearing Co., Ltd., Newark-on-Trent.—A comprehensive catalogue of the company's roller and ball bearings for all purposes. The list is illustrated and priced, and provided with a thumb index to the various sections.

The Atlas Diesel Co., Ltd., 35, Surrey Street, Strand, London, W.C.2.—A well-illustrated booklet describing the company's air compressors and pneumatic tools.

Messrs. A. F. Bulgin & Co., 9-11, Cursitor Street, Chancery Lane, E.C.4.—List 111, illustrating various "Competa" radio products; list 112, "Competa" measuring instruments; lists 114 and 115, "Deckorem" radio products; and list T.2, illustrating "Taka" radio terminals. The whole are contained in a convenient folder carrying the company's name and address, &c.

The Walker Electrical Service, Annandale Street, Edinburgh.—A folding card advertising the firm's repairing and overhauling business.

Higgs Motors, Witton, Birmingham.—A comprehensive catalogue of the firm's industrial a.c. and d.c. motors, containing full specifications, details and prices, as well as particulars of control gear.

The Marconiphone Co., Ltd., 210-212, Tottenham Court Road, W.1.—A coloured poster (38 in. by 29 in.) setting out in minute detail the arrangement and wiring of the K-1 three-valve receiving set operating direct from a.c. mains.

Messrs. S. Davis & Co., Aldwych House, Aldwych, W.C.2.—A brochure illustrating many examples of the firm's publicity work in widely-differing fields.

Bankruptcy Proceedings.

T. F. Collier, Union Street West, Oldham, electrician.—The public examination of this debtor was held recently at the Court House, Oldham. The statement of affairs showed liabilities of £77, and there were no assets. Debtor stated that in February, 1919, he commenced business as an electrical engineer at Olive Street, Werneth, with £500 left by his father. He was successful at first, but later there was a decline in trade owing to general depression. In August, 1922, he sold the business to a limited company for 430 £1 fully-paid shares. These debtor later sold to his mother for 10s. a share in consideration of a loan of £500 received in 1921. In July, 1926, debtor started as an electrical engineer again, but owing to lack of capital was not successful, and in January last his trade effects were realised under an execution. The examination was adjourned.

W. J. Broome (Stockport Electrical Co.), electrical engineer, Garrick Place, Daw Bank, Stockport.—First meeting to be held to-day (Friday), at the Official Receiver's offices, Manchester; public examination, May 3rd, at the Court House, Stockport.

H. Busfield and J. J. Whittaker (Busfield & Co.), electrical engineers, 6, Wilfield Street, and 215, Padiham Road, Burnley.—Trustee, Mr. H. Parker, Official Receiver, 11, Winckley Square, Preston, released April 6th.

Company Liquidations.

Service Radio Co., Ltd., 67, Church Street, Stoke Newington, N.16.—A meeting of creditors was held on April 19th at the Institute of Chartered Accountants, E.C., when the chair was occupied by the liquidator, Mr. I. Levy, 27, Chancery Lane, W.C. The statement of affairs presented disclosed liabilities of £1,409, of which £1,320 was due to the trade, and assets of £308, leaving a deficiency of £1,101. The liquidator reported that the company was registered on February 15th, 1924, with a nominal capital of £1,000, to carry on the business of manufacturers of wireless components and parts. The subscribed capital was £150, fifty £1 shares being held by Mr. W. Grossman and 100 £1 shares by Mrs. L. Grossman, his sister-in-law. The management of the business had been under the control of Mr. Grossman. For the 17 months to July 31st, 1925, there was a net profit of £89. The turnover for that period was £14,645, on which there was a gross profit of approximately 20 per cent. For the 12 months to July 31st, 1926, there was a turnover of £4,331 and a loss of £74. In that period £1,012 was spent on advertising. Accounts for the eight months to March 31st, 1927, showed a turnover of £2,532 and a loss of £529. Endeavours had been made to obtain fresh capital without success; creditors began to press, and it was decided to go into voluntary liquidation. One creditor had levied execution, and over £100 worth of stock had been sold to satisfy the claim. A resolution was passed providing that application should be made to the Court for the appointment of Mr. W. A. J. Osborne, of Messrs. Corfield & Cripwell, Balfour House, Finsbury Pavement, E.C., as liquidator in the place of Mr. Levy. The following are creditors:—

	£		£
Albion Mfg. Co. ...	69	Igranic Electric Co., Ltd.	43
Birkbys, Ltd.	27	Jewel Pen Co.	75
Benjamin Electric, Ltd.	79	Odham's Press	47
Clackson, A. H., Ltd. ...	186	Petruskin, —	49
Chloride Electrical Storage Co., Ltd.	166	Radio Communication Co., Ltd.	20
Climax Radio Co. ...	27	Recorder Press	41
Clayton Rubber Co. ...	21	Robertson, —	20
Graham, Enoch, Mfg. Co.	34	Trauberman, —	79
Grossman, L.	44	Telegraph Condenser Co., Ltd.	99
Grossman, W.	45	*Wireless Trader* ...	100
Thorpe & Butcher ...	29		

Sherborne Trust, Ltd., 65, London Wall, E.C.—Under the compulsory liquidation of this company Mr. G. Digby Penys, Official Receiver and Liquidator, reports that it was formed in June, 1926, with a nominal capital of £2,500, and entered

into various underwriting contracts for shares and debentures, some of which it was unable to fulfil. The promoters were Messrs. Frederick Seyffert and J. A. H. Chaproniere. In respect of one sub-underwriting contract for £100,000 debenture stock of the Perak River Hydro-Electric Co., Ltd., the company had to take up and was allotted £7,800 of the stock. A cheque for the application money of £500 is stated to have been given by Mr. Chaproniere, but was dishonoured, and the amount had to be paid by the underwriters. The company received £250 and 500 ordinary shares of £1 each in the Perak River Hydro-Electric Co., Ltd., as commission. The underwriters obtained judgment against the company for the £500 paid by them, and obtained a charging order absolute on the debenture stock and the 500 ordinary shares. The company was unable to carry out its contract. The allotment was cancelled and the £500 paid by the underwriters forfeited. The accounts filed under the liquidation show liabilities £2,249, against assets £7; whilst the only issued capital of the company are two signatories' shares, which do not appear to have been paid for.

Deed of Arrangement.

MRS. NINA RAYNER, trading as D. D. Rayner & Co., electrical engineers, 26a, Curzon Street, Derby.—The trustee, Mr. J. M. Sibbald, 21, Corn Market Derby, reports that the winding-up of the business has been delayed by a disputed account. A statement shows a balance of £95, and it is said that as soon as the account mentioned is settled, the surety will be called upon for the balance due in order to make up the composition of 6s. 8d. in the £.

Dissolution of Partnership.

FALGATE ELECTRICAL CO., 9, Merchants' Place, Reading.—Messrs. A. E. Falgate and A. S. Sayer have dissolved partnership. Mr. Sayer will continue the business at the old address. Mr. Falgate will carry on business at 21a, King's Road.

Employment During March.

The April *Ministry of Labour Gazette* states that while employment in a number of important industries remained bad during March, there was, nevertheless, a pronounced improvement in industry generally. There was a further, almost general, improvement in the engineering industry, and the overall percentage of unemployed fell from 11.6 in February to 10.3 in March. The unemployment percentage of the electrical engineering branch fell from 6.5 to 6.2. In the electric cable, wire and lamp manufacturing group the proportion of unemployed remained at 8.6 per cent, but there was a fall in the case of the electrical wiring and contracting industry from 8.9 to 7.9 per cent. The actual numbers of unemployed at March 21st were as follows:—Total, 1,187,782; engineering (including electrical), 103,262; electrical engineering, 4,790; electrical wiring and contracting, 1,093; and cable, wire and lamp manufacturing, 7,567.

Irish Free State Wireless Duty.

In the course of his recent Budget statement in Dail Eireann, Mr. E. Blythe, Minister for Finance, said that the import duty on wireless apparatus was calculated to produce £20,000 during the financial year 1926-27, and the actual yield had been just over £19,000 in that period. The policy of the Government was to expend on additional stations and provide better programmes, all the revenue got out of broadcasting, whether in the way of Customs duties, licence fees, or fines recovered from defaulters.

Scientific Production.

The *Financial Times* quotes the following statement by Mr. J. C. Goff at last week's annual meeting of Crosse & Blackwell, Ltd., upon the subject of the installation of up-to-date efficient plant:—"We now work 47 hours per week. On the same turnover, with the introduction of modern machinery and scientific methods, we are getting more goods made, we are paying better wages, we are getting shorter hours, and we are earning bigger profits."

Australian Wireless Litigation.

The Melbourne *Age* reports that recently the action of the Amalgamated Wireless (Australasia), Ltd., Sydney, and the Associated Radio Co., of Australia, Ltd., Melbourne, was before the Chief Justice in the Practice Court on an application for a stay of proceedings in the action pending appeal to the State Full Court. The action relates to an agreement under which the Amalgamated Wireless granted a licence to the Associated Co. to use certain patents, in return for which the latter company agreed to pay 25 per cent. of its revenue as a broadcasting authority, with a minimum of 10s. per subscriber. At the date of the agreement the regulations provided for the broadcasting company to charge a fee to all listeners-in, but later this arrangement was replaced by a State licensing system whereby part of the receipts were paid to the company by the Government. The defendant company thereupon contended that the agreement terminated as the basis was destroyed, but Mr. Justice McFarlan gave judgment for the plaintiff company for £5,502. Counsel for the latter offered to repay the money within 48 hours if Mr. Justice McFarlan's decision was set aside. This undertaking was accepted, and the application was dismissed.

Book Notices.

"Principes de L'Electro-Chimie," by J. Ponsinet. Pp. 211. Paris: Armand Colin. Price 9 fr.

"Electrical Horology," by H. R. Langman and A. Ball. Pp. xi+170; figs. 68. London: Crosby, Lockwood & Son. Price 7s. 6d. net.

"*Journal* of the Institution of Electrical Engineers." Vol. LXV. April, 1927. No. 364. London: E. & F. N. Spon, Ltd. Price 10s. 6d.

Scientific Papers of the U.S.A. Bureau of Standards. Vol. 21, No. 546, "Magnetic Reluctivity Relationship." (5 cents.)

"Carbon Brushes and Brush Shunts. Simplified Practice Recommendation." No. 56. Issued by the U.S.A. Bureau of Standards. (5 cents.)

American Exports to New Zealand.

In a recent article upon the New Zealand electrical market, *Commerce Reports* shows that United States electrical goods to the value of $1,404,363 were imported into the Dominion during 1925. The chief item was storage batteries ($171,042), while other notable classes were domestic heating and cooking devices ($130,431), electro-medical apparatus ($98,265), flashlight batteries ($72,420), and switches and circuit breakers over 10 A ($70,394). Our contemporary claims that for sizes up to 5 h.p. American motors predominate.

The Department of Overseas Trade.

The following resolution was to be moved on behalf of the Executive Council at the annual meeting in London this week of the Association of British Chambers of Commerce:—

"The Association of British Chambers of Commerce regards with dismay the proposal of His Majesty's Government to discontinue as a separate department the Department of Overseas Trade. The Association is of opinion that the department has proved itself to be of great value in the assistance which it has rendered to the overseas trade of the country, and that so far from its discontinuance as a separate department being likely to benefit the finances of the country, such a change will tend to retard the extension of our commerce overseas, and the loss to the Treasury will cancel any saving in expenditure. The Association believes, moreover, that only a small part of the expenditure of £328,000 a year will be saved because many of the functions performed by the department are pre-war duties which were previously undertaken by the Board of Trade or the Foreign Office, and must be continued and paid for. The Association therefore urges His Majesty's Government to allow the work of the department in the furtherance of British trade to continue separately on its present lines, and to be extended."

New Artificial Silk Company.

The position with regard to the contract openings of Scottish Artificial Silks, Ltd., has been somewhat clarified by the registration of the company with a capital of £250,000 and offices at 145, St. Vincent Street, Glasgow. The company is to erect a weaving factory at Kirkcudbright, in the old Galloway motor works, and a yarn-producing plant at Hyde, in the old Providence Mill. Negotiations are almost completed for the purchase of the old Argyll Motor Works at Alexandria, near Dumbarton.

Prices of Raw Materials.

Messrs. F. Smith & Co. report, April 26th:—Copper (electrolytic) bars, £62 5s., 15s. dec.; ditto ditto sheets, no change; ditto ditto wire rods, £72 5s., 15s. dec.; ditto ditto h.c. wire, 9¼d., ¼d. dec.; Silicium bronze wire, 10¼d., ¼d. dec.

Messrs. James & Shakespeare report, April 26th:—No change in the prices of copper bars (best selected), sheet and rod; English pig lead, £27 5s., 20s. dec.

Messrs. Edward Till & Co. report, April 26th:—No change in the price of India-rubber, Para fine.

Messrs. C. Clifford & Son report, April 26th:—Babbitt's metal and anti-friction metal, Grade I, £258, £14 dec.; Grade II, £180, £9 dec.; Grade III. £94, £3 dec.

Messrs. James Forster & Co., in their letter dated April 23rd, state:—"Closing prices yesterday were £26 1s. 3d. for April, and £26 10s. for July. . . . Before the Easter holidays consumers showed some interest, and purchases were made by cable makers and the home trade. This week demand has been very quiet, which is not surprising in view of the fresh fall in prices. . . . The future is obscure, but there are certainly more grounds for optimism than pessimism. The position on the Continent is improving, while in this country, the reduction in the Bank rate is bound to stimulate industry and increase demand. Moreover, the metal is getting to a figure which may result in trouble in the mines, particularly in Australia, and thereby hamper production. The Board of Trade returns for March show imports of 22,504 tons and exports of 1,317 tons, leaving 21,187 tons for home absorption."

Lighting and Power Notes.

Bangor.—Loans.—The Town Council is applying for sanction to borrow £1,000 for transformers and switchgear, £1,000 for meters, and £6,000 for mains and services.

Barking.—Loans Sanctioned.—The Electricity Committee has received sanction to the borrowing of £4,000 for buildings, £4,000 for mains, and £3,280 for plant.

Barnsley.—Change-over.—The borough electrical engineer has submitted a report to the Electricity Committee upon the necessity of a further change-over from d.c. to a.c. in certain areas in order to meet the winter load of 1927, and also the provision of a sub-station and a ring h.p. main between Harboro' Hill Road and Hall Baulk Lane, at a total estimated cost of £5,336. Application is to be made for sanction to a loan for this purpose.

Birkenhead.—Electrical Development.—That the Corporation electricity showrooms have well justified their expense is demonstrated by statistics which have just become available. During the past year, since the opening of the showroom, the following increases in the use of electrical devices have been registered:—Cooking appliances, 285 per cent.; electric fires, 86 per cent.; other domestic appliances, 75 per cent. The value of apparatus sold by the showrooms was £5,700. During the year ending March 31st last 2,820,000 kWh was sold for domestic consumption, an increase of 112 per cent. The showrooms are to be extended.

Bridge of Allan.—Electricity Supply.—In the event of the Electricity Commissioners sanctioning the transfer of the Town Council's Special Order to the Scottish Midland Electricity Supply, Ltd., the company is prepared to undertake the laying of an underground distribution network in the burgh at an estimated cost of £4,500. Pending the transfer of the Order the company will act as the duly authorised agents of the Council.

Buckingham.—Electricity Supply.—The Town Council and the Rural District Council have consented to an application by the Northampton Electric Light and Power Co., Ltd., to extend its area of electricity supply to include the borough and rural area. Underground mains will be laid in certain streets in the borough, and overhead cables erected in the rural area, and the maximum prices will be 10d. per kWh in the borough and 1s. in the rural district.

Canada.—Electrical Development.—The Dominion Water Power and Reclamation Service of the Department of the Interior of Canada has recently issued the annual review of the water-power resources of Canada, developed and undeveloped, as at March 1st, 1927, according to the most recent information available. This bulletin includes sections dealing with current progress and development, the use of water-power in the central electricity stations and for the pulp and paper and other leading industries, the coal equivalent of developed water-power, and estimates of the developed and undeveloped water-power in each province. By the end of the year 1926 Canada's hydro-electric installation reached a total of 4,556,266 h.p., of which 265,838 h.p. was installed during that year. While the addition for 1926 was substantial, it falls far short of indicating actual constructional activities, as projects under way, a number of which are nearing completion, will ultimately add to the Dominion's total more than 1,700,000 h.p., while others in active prospect indicate a further addition of 1,000,000 h.p. The capital investment due to these developments under construction and in prospect is estimated at approximately $270,000,000, regardless of the extra capital required in the application of their power output.

Clayton (Yorks.).—Loan.—The Urban District Council is applying for sanction to the borrowing of £7,000 for mains, &c.

Supervising Engineer Appointed.—Alderman J. W. Longley, deputy chairman of the Bradford Corporation Electricity Committee, was consulting engineer to the Urban District Council during the negotiations which recently resulted in the Council securing an Order to supply electricity in the district, and has now accepted the position of supervising engineer in connection with the laying of cables and services. It is expected that an electricity supply will be available next winter.

Continental.—Portugal.—A new company called the Confederacao Hidrografica do Douro, a subsidiary of the Espano-Portuguesa de Transportes Electricos, has been formed for the purpose of utilising the waters of the Douro for industrial and irrigation purposes. By the use of turbines the river is expected to yield a total of 800,000 h.p.—*Reuter* (Lisbon).

Belgium.—The Société d'Electricité de l'Escaut, Antwerp, in its report for last year, states that the number of consumers increased from 24,147 to 30,800, while the sale of power advanced by 16 per cent. At the Merxem power station three new boilers and two additional 12,500-kW turbo-generator sets were installed and put in operation. A 50,000-V transmission line was also completed to supply power to the northern and eastern portions of the province of Antwerp, and the line is now being extended in order to link up the Merxem power station with one at Moll-Donck which is being erected by the Société d'Electricité de la Campine.

Italy.—As a result of the difference in the conditions between the water supply for the hydro-electric power stations in the Alps and in the Appennines, it has been found desirable to connect the plants in the two areas by means of h.p. transmission lines so that in times of low output and high demand one can supply the other. A 130,000-V line has recently been erected by the Società Interregionale Cisalpina to connect the plants of the Società Edison in the Southern Alps with the stations of the Società Emiliana d'Esercizi ed Idroelettrica in the Northern Appennines. The line is about 94 miles in length, and extends from a transformer station at Brughiero, near Milan, to Reggio Emilia. The Società Edison has two stations, one at Paderno, with an annual output of 300 million kWh, and the other at Oresca capable of an output of 200 million kWh per year. The Società Emiliana has plants in operation and in course of construction with a capacity of 133,000 kW. The Brughiero transformer station will later be connected to new plants with a total capacity of 275,000 kW, which the Società Cisalpina is erecting on the Livo at Chiavenna and on the Mera near Sondrio.

Switzerland.—Application has recently been made for a concession to establish a plant near Klingnau to utilise the water power of the lower falls on the Beznau-Koblenz, where it is estimated that from 18,000 to 30,000 h.p. is available. The power produced would be "exported" to Wurtemburg, but if the concession is granted a Swiss company is to be formed to exploit it.

Croydon.—New Cables.—The Corporation Electricity Committee is to replace cables from Crown Hill and Gloucester Road to the power house, at a cost of £1,900.

Douglas (I. of M.).—Loan.—The Electricity Committee is applying for sanction to the borrowing of £11,000 for mains, services, meters, cookers, &c.

Farnham.—Electricity Charges.—The Electricity Charges Committee of the Urban District Council reports that in May last the Council approached the Farnham Gas and Electricity Co. with a request for the voluntary reduction of the present lighting charges from 10d. to 6d. per kWh, and for a reduction in power charges, upon the ground that the company was now purchasing its supply in bulk from the War Department. The consideration of this request has been held in abeyance until the completion of the company's accounts for the year 1926. The Committee has had an interview with representatives of the company, who have intimated that it is not prepared at the present time to make any reduction. The Committee is of opinion that application should be made to the appropriate Government department for an Order reducing the maximum prices, in the hope that the Department will hold an inquiry into the circumstances of the case.

Grantown-on-Spey.—Electricity Supply.—The town has been supplied with electricity since 1912, under an agreement with a local contractor, and the Council has now decided to renew the agreement, which was due to expire this year, as an alternative to purchasing the undertaking. The new agreement is made subject to the contractor installing additional plant and modifying and extending the distribution system to meet the demands of the burgh. Mr. Frank Anslow, M.I.E.E., of Messrs. Walter Dixon & Co., Glasgow, who has been advising the Council in its negotiations with the contractor, has been retained for a period of three years to supervise the installation on its behalf.

Gravesend.—Loan Sanction.—The Corporation Electricity Committee has received sanction to a loan of £20,000 for mains and services.

Grimsby.—Loan.—The Corporation Electricity Committee is applying for sanction to the borrowing of £20,000 for mains and services.

Halifax-Huddersfield.—Interconnecting Scheme.—Speaking at Halifax Rotary Club, on April 20th, Alderman Thos. Hey, chairman of the Tramways and Electricity Committee, stated that the linking between the Halifax and Huddersfield Corporation electricity undertakings was now complete and had already been working. From midnight on the Saturday preceding Easter to the morning of Wednesday following Easter the Halifax station had been supplying the whole of Huddersfield, as well as Halifax, whilst much-needed repairs were undertaken at Huddersfield station. The repairs at Huddersfield not being yet completed, the Halifax station was still supplying Huddersfield with 2,000 kW to complete the Huddersfield load.

Harrogate.—Electricity Agreements.—The Council has ratified agreements for the purchase of the Knaresborough electricity undertaking and a bulk supply of electricity to Ripon.

Hastings.—Electricity Extensions.—The Town Council is commencing forthwith the laying of mains and the erection of overhead cables for a supply of electricity to Rye, Battle, and to places in the rural districts of Hastings, Rye, Battle, and Hailsham. The estimated cost of the work is over £70,000, and the proposed charges are 8d. per kWh for lighting and 1½d. per kWh for power.

Hull.—Electricity in Bulk.—Provided sanction is obtained from the Electricity Commissioners, the Corporation will supply electricity in bulk to Driffield. According to the *Manchester Guardian*, in a letter from the Driffield Urban

Council it was suggested that future extensions of the electricity undertaking might link up outlying districts between Hull and Bridlington so that intervening local authorities might take supplies in bulk for local consumption. The Corporation has already decided to seek sanction for an extension of its supply to Beverley at the request of the latter town.

London.—Islington.—The Electricity Committee is applying for sanction to the following loans:—Meters, £8,000; transformers, £20,000; mains, £27,000; services, £17,000. The Committee proposes to proceed with the erection of cooling towers at the power station at a cost of £33,000.

Milton (Hants.).—Electricity Supply.—At a recent meeting of the Urban District Council it was reported that a meeting with the representative of the Milton and Barton-on-Sea Electricity Supply Co. had been held, who pointed out that if underground cables were laid the cost of electricity would be 2d. per kWh more than if overhead cables were erected. It was suggested that there should be no overhead lines from the railway station to the corner of Barton Court Road and Avenue and the Marine Drives. After some discussion it was decided to approve the suggestion, and the overhead system of wiring, subject to certain safeguards, was agreed to.

Newport (I. of W.).—New Cables.—The Town Council has given permission to the Isle of Wight Electric Light and Power Co. for the laying of armoured service cables under the bed of the river Medina, in Hillside Road, and along the railway line from Newport to Cowes. The borough surveyor states that the railway line cable will be placed on concrete posts about 4 feet high.

Northern Ireland.—Portadown (Co. Armagh).—The Urban District Council has passed plans for the reconstruction of the local company's power station, which was recently destroyed by fire.

Palestine.—The Rutenberg Concession.—According to a correspondent at Jerusalem, the concession granted to the Palestine Electric Corporation (the "Rutenberg" concession) for the electrification of Palestine and the irrigation of the country has now been put into force by an order of the Government of Palestine. With regard to the extension of the scheme to Transjordania, there is still some opposition. Another scheme concerns the utilisation of water power for purposes of electrification in Southern Lebanon. A commission, under the presidency of the Minister of Public Works, has been appointed to examine the question of the use of the power of the Nahrel Awali, the preliminary works being still in an initial stage.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Whitehaven.—Lighting, heating and power: A reduction of ¼d. per kWh.

Luton.—The increase of 66⅔ per cent. made owing to the coal dispute has been removed.

Radcliffe.—The temporary increase due to the coal strike has been withdrawn.

South Africa.—Bloemfontein (O.F.S.).—The new power station was formally inaugurated by the Administrator of the Orange Free State on March 24th. The erection of the station was commenced in March, 1925, and has cost £180,000. The plant includes two 3,000-kW sets, and the work was carried out by Messrs. Clarke & Partner, of Johannesburg.

South-East Lancashire Electricity Advisory Board.—The Board has decided that a committee be appointed to consider various methods by which some measure of district control could be secured, either by means of the delegation of powers by the Central Electricity Board, or otherwise, with a view to reporting when the scheme for this district is formulated by the Central Board as to any change which might then be possible or desirable in the organisation of the district.

Southend-on-Sea.—New Cable.—The Electricity Committee has informed the Highways and Works Committee that it proposes to lay a main past Belfairs and Kent Elms Corner, and thence to Southbourne Grove, at an estimated cost of £3,060. Application has been made for a Special Order authorising the supply of electricity to premises which are situated outside the borough boundary, and it is anticipated that the work of laying the cable will commence as soon as such powers are obtained.

Special Orders.—Application has been made to the Electricity Commissioners for a Special Order by the Tonbridge Urban District Council authorising it to extend its area of electricity supply so as to include the parish of Hildenborough and part of the parish of Leigh.

The Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising the Porlock and District Electric Supply Co., Ltd., to supply electricity in part of the rural district of Williton, and the Electrical Distribution of Yorkshire, Ltd., to supply in the urban districts of Altofts, Ardsley East and West, and Methley, the rural district of Wakefield, and part of the rural district of Tadcaster.

Swansea.—School Lighting.—At a recent meeting of the Education Committee it was reported that at a joint conference between representatives of committees, together with the borough treasurer, the borough electrical engineer and the borough architect had decided to make the following recommendations with regard to the wiring of schools for electric lighting:—That the director of education and the borough treasurer be authorised to explain to the Board of Education the authority's scheme for the electric wiring of all its schools during the present year instead of spreading the work over a period of about 15 years; that on securing the approval of the Board of Education, application be made to the Ministry of Health for sanction to a loan to cover the cost of the work; that the borough electrical engineer be authorised to arrange that Sketty, Cwmbwrla Boys' and Morriston Boys' Council schools be wired forthwith.

Tramway and Railway Notes.

Argentina.—Buenos Aires.—Lord Ampthill has arrived at Buenos Aires. It is understood that the main object of his visit is in connection with plans for the construction of an underground railway and new tramways, the award of the contract for which has been held up for a long time owing to the inability of the local authorities to agree as to the apportionment of the cost.—*Reuter* (Buenos Aires).

Brazil.—Railway Electrification.—The Companhia Paulista has decided to electrify a further 93 km. of its railway, from Rio Claro to Sao Carlos-de-Pinhal. Contracts for materials for the electrification of this section, as well as that to Rincon, a further 82 km., have been placed. The company has under consideration the electrification of the section Campiñas-Casa Branca section of the Magyana railway (172 km.).—*Reuter's Trade Service* (Sao Paulo).

Burnley.—New Route.—The Corporation tramway extension past the Turf Moor football ground was inaugurated on April 14th. For the present single-deck cars will be run.

Continental.—Austria.—It is reported from Vienna that the new National Council will be occupied with a scheme prepared by the large electrical companies and the Vienna banks for the conversion to electric traction of further railways, including those between Vienna and Salzburg, Vienna and Graz, and the Tauern line. The total expenditure is estimated at 310,000,000 schillings, and the execution of the scheme would lead to an economy of 540,000 tons of coal per annum.

Switzerland.—The Geneva correspondent of *The Times Trade and Engineering Supplement* reports that electrification is steadily progressing on the Lausanne-Berne line (61 miles), and electrically-driven trains are now running on the Lausanne-Romont section (25½ miles). It is expected that the conversion will be completed between Lausanne and Berne by May 15th, when about 20 minutes will be saved on the journey, which now takes two hours. Between Lausanne and Romont the line rises 853 ft., and in spite of steep gradients an electric locomotive was able during recent trials to haul a 200-ton train at a speed of 40 miles an hour on the steepest section and at a speed of 50 miles an hour on the Palezieux-Romont section. The conversion of the Lausanne-Berne section will mean the complete electrification of the Geneva-Berne-St. Margarethen line, linking France with Austria across Switzerland.

Holland.—The municipal authorities of Rotterdam have decided to take over the tramway undertaking owned by the Rotterdam Electric Tramways Co.

Glasgow.—Tramcar Improvements.—A report by the tramway manager on the rolling stock of his department states, with regard to lighting, that owing to the cheap rate, the cost of lighting is not great, and he recommends that four circuits, instead of three, should be the standard in future. For some time the department has been experimenting with 100-V, 40-watt internally-frosted lamps. These have given good results so far as improved illumination is concerned, but the "mortality" has been very high. Further experiments are still being conducted with a view to ascertaining the best type of lamp for cars. Experiments in heating are also being made, and firms have asked to be allowed to demonstrate their ideas on two cars.

Preston.—Permanent-way Renewals.—The Tramways Committee has recommended permanent-way renewals amounting to £10,020 during the current year. The amount includes £4,000 for permanent-way renewal from the borough boundary to Moor Park Avenue, £900 for permanent-way between the Beech Grove Co-operative and Ashton terminus, and £800 for permanent-way between Fulwood Hall Lane and barracks. Four cars are to be reconstructed at a cost of £2,400.

Pontypridd.—Inquiry.—On behalf of the Minister of Transport, Mr. A. D. Erskine recently held an inquiry at the Municipal Buildings into the application for sanction to extend the tramway to Rhydyfelin. According to the *Western Mail*, Mr. H. L. Porcher, clerk to the Council, referred to the houses which had been built at Rhydyfelin, and to the fact

that in this particular part of the district there were many residents who worked at collieries long distances away. The extension would be a great convenience, and there would be a corresponding benefit to the town generally and to the tramway undertaking. Mr. J. E. Teasdel, chief electrical engineer to the Council, said no additional plant or supplementation of the staff would be required if the Council's application were granted, and the running of the tramway would be made simpler. The Ministry will give its decision in due course.

Sheffield.—New Cars.—The Corporation is to build 25 double-deck tramcars in the Corporation works, and another 25 are to be bought under contract. The total cost will be £117,500.

Telegraph and Telephone Notes.

India.—Automatic Satellite Telephones.—With a view to extending telephony in India, by providing exchanges in outlying towns and villages, the Indian Telegraph Department has been experimenting with a 10-line automatic exchange, the switchboard of which is connected by a short trunk line to the nearest telephone centre, all the calls both to and from subscribers on the outlying "satellite" exchange being dealt with by the operator in the central exchange. One such switchboard was installed on trial in Kalka last December, and was so successful that four more are now being installed in the same district; they will be watched with much interest, for the system, if successful under service conditions, will open up possibilities for development in an untapped field. The installation of a set in Bombay recently also gave satisfaction.

New Zealand.—Automatic Telephony.—A new automatic telephone exchange at Stratford, New Zealand, has been completed by Siemens Bros. & Co., Ltd., Woolwich, and was opened on the 8th instant. The exchange has an initial equipment for 600 ordinary lines and 50 rural and party lines, with an ultimate capacity of 900 and 100 respectively. The exchange equipment includes a two-position manual board and a one-position test deck. The automatic equipment is the No. 16 type with several novel and interesting features, which include revertive calling on 4-party lines and special signalling arrangements for the rural lines.

Radio Notes.

Irish Free State.—Cork Station.—The new State broadcasting station at Cork, which is intended to serve the south and west of the country, was officially inaugurated on April 25th by Mr. J. J. Walsh, Minister for Posts and Telegraphs. Equipped with "Standard" plant, the Geneva rating of the station is 1.5 kW, which means that 4-kW "peak" power can be handled without distortion. It will operate on a wave-length of 400 metres and its call sign is 6CK.

Licence Revenue.—In Dail Eireann, Mr. Ernest Blythe, Minister for Finance, said that the yield from the duty on wireless-telegraphy apparatus in the Irish Free State from April 22nd, 1926, the date of the imposition of the duty, up to and including March 31st, 1927, was £19,008. The total amount received from licences on wireless receiving sets for the first three months of the present year was £8,315, *viz.*, for January last, £2,432; for February, £4.527; and for March, £1,356. The number of receiving licences issued in the Free State during the financial year ended March 31st, 1927, was 21,795. The figure for Northern Ireland was 28,455 up to February 28th, 1927.

Long-wave Stations.—Interference Tests.—Capt. P. P. Eckersley, chief engineer of the B.B.C., and M. Braillard, the Belgian president of the Technical Committee of the Union Internationale de Radiophonie, have co-operated in carrying out tests recently to ascertain the amount of wave-length separation needed between long-wave high-power stations in order to avoid interference between them. At its meeting at Geneva next month the Union will consider the results of the investigation. A 10-kilocycle interval between stations is apparently as essential in the case of long-wave stations as it is in that of the shorter band, while it seems to be not really sufficient between two powerful stations geographically "near" to each other.

U.S.A.—Fewer Stations Advocated.—A plan for the reduction of the number of broadcasting stations in the United States from 733 to 364 has been submitted by the American Engineering Council to the Federal Radio Commission, says *World Radio*. Under the scheme there would be 64 national stations and 300 local stations; the former would operate in the band between 550 and 1,250 kilocycles, that is to say, from 240 metres to 545 metres: the local stations would be confined to the range of from 1,250 to 1,500 kilocycles, or from 240 down to 200 metres. The proposal has the support of many radio engineers and was worked out by the Radio Broadcasting Committee of the Engineering Council.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the Electrical Review containing the advertisement is given in parentheses below.

Contracts Open.

Australia.—Melbourne.—June 1st. Victorian Government Railways. Electric time-releasing mechanisms. (B.X. 3431.)*
July 5th. State Electricity Commission. One 15,000-kW steam turbo-generator and accessories. (B.X. 3369.)*
Tensioning and suspension-type insulators. (B.X. 3455.)*
Sydney.—June 22nd. New South Wales Government Railways. Remote-control switchgear. (B.X. 3442.)*
June 20th. Municipal Council. Turbo-alternators for Bunnerong power station. (B.X. 3443.)*
Brisbane.—May 18th. City Electric Light Co., Ltd. Outdoor switchgear. (B.X. 3456.)*

Barking.—May 9th. County of London Electric Supply Co., Ltd. Cables and accessories for the Barking power station. (April 1st.)

Belgium.—May 3rd. Department des Ponts et Chaussées, 15, Rue de la Charité, Brussels. Electrical and mechanical equipment for the Kruisschans Dock, Antwerp. Particulars (Cahier des Charges et Plans) for 52 fr., from 15, Rue des Augustins, Brussels.

Darton.—May 17th. West Riding Education Committee. Electric lighting installation at Darton Kexborough new school. Specifications from Education Department, County Hall, Wakefield.

Durrington (Wilts.).—April 30th. Wiring 30 houses, for the Durrington Electric Light Co., Ltd., Mr. S. N. Bigwood, secretary, Midland Bank Chambers, Salisbury.

Edinburgh.—May 2nd. District Board of Control. Electricians' work at new buildings at Gogarburn Institution. Mr. Stewart Kaye, architect, 14, Hill Street, Edinburgh.

May 16th. East Lothian Education Authority. Works, including electric lighting installation, for the extensions, &c., at Macmerry Public School. Schedules from the surveyors, Messrs. R. & A. K. Smith, 44, Queen Street, Edinburgh.

Egypt.—Cairo.—May 24th. Director-General of Prisons. Twelve months' supply of electric lamps, &c. (C.X. 2268.)*

Grimsby.—May 2nd. Electricity Department. E.h.p. and pilot cables; l.p. feeder cables. (April 15th.)

London.—St. Marylebone.—May 18th. Electricity Department. L.p. and e.h.p. cables for 12 months. (April 15th.)
Islington.—June 1st. Electricity Department. Steel-tube lamp columns, 2,200-V feeder switchgear, rotary and/or static power factor correctors. (April 22nd.)
Metropolitan Asylums Board.—May 18th. Installation of a multiple roller ironing machine; new steam boiler, &c.; steam main; electric power in laundry, &c., at Darenth Tramway Colony; conversion of mechanical stokers to hand firing at North-Eastern Fever Hospital. (See this issue.)

Manchester.—May 5th. Electricity Committee. Twelve months' supply of electric kettles, potential and current transformers, electricity meters, and cable supplies. (April 22nd.)
May 3rd. Stores required during the 12 months ending June 30th, 1928. Mr. H. C. Lamb, chief engineer and manager, Electricity Department, Town Hall.

May 10th. Tramways Committee. Trucks, motors, and controllers for electric tramcars; tramway poles, span-wire brackets, trolley wire, and copper bonds. Mr. H. Mattinson, general manager and chief engineer, 55, Piccadilly, Manchester.

New Zealand.—Wellington.—June 21st. Public Works Department. Sub-station switchgear and metering equipment for Arapuni. (B.X. 3398.)*

June 7th. Railway sub-station equipment, Lake Coleridge electric power scheme. (B.X. 3295.)*

June 13th. New Zealand Railways. Machine tools, workshop equipment and overhead electric travelling cranes. (A.X. 4344.)*

June 6th. Six electric locomotives. (A.X. 4355.)* Overhead equipment for the Christchurch-Lyttelton electrification scheme. (B.X. 3301.)*

Invercargill.—May 31st. Southland Electric Power Board. Transformers. (B.X. 3379.)*

June 15th. 66,000-V oil circuit-breakers. (B.X. 3378.)*

Lyttelton.—July 20th. Harbour Board. Four 5-ton electrically-operated portal cranes, and ten electrically-operated capstans. (A.X. 4532.)*

Sleaford.—May 17th. Electricity Department. Cables, boxes, &c. (See this issue.)

South Africa.—Cape Town.—June 1st. The University. Electric cooking utensils for the new residences at Groote Schuur. (B.X. 3393.)*

Scarborough.—June 3rd. Corporation. Installation of electrical pumping plant in duplicate for the new Irton water scheme No. 2. Specifications (£5) from Dr. H. Lapworth, engineer, 25, Victoria Street, S.W.

Thorne.—May 17th. West Riding Education Committee. Electric lighting installation at new boys' school. Specifications, &c., from Education Department, County Hall, Wakefield.

Uruguay.—Montevideo.—June 15th. State Electricity Supply Works. 15 transformer sub-station equipments (6,600/220 V, 50 cycles). (B.X. 3371.)* Five overhead transformer sub-stations mounted on tubular or section iron columns. (B.X. 3430.)*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Australia.—Sydney.—Electricity Supply Committee. Recommended:—

Bare copper cable (Spec. 1095), £6,552; double-braided weatherproof cable (Spec. 1090), £5,351.—Enfield Cable Works (Aust.), Ltd. —*Tenders.*

Barnsley.—Board of Guardians. Accepted:—

Electrical work at the Institution.—Brown & Roberts.

Bury St. Edmunds.—Board of Guardians. Accepted:—

Installing electric lighting at the Institution (£345).—Wood & Co.

Chesterfield.—Rural Council. Accepted:—

Electrical installation in connection with the sewage disposal works (£1,457).—British Thomson-Houston Co., Ltd.

Electric travelling crane and railway (£511).—Thomas Smith & Sons (Rodley), Ltd.

Government Contracts.—The following contracts were placed by various Government departments during March, 1927:—

Admiralty, Contract and Purchase Department.

Motor alternators.—Small Electric Motors, Ltd.

Alternators and spare armatures.—Newton Bros. (Derby), Ltd.

W./t. amplifiers.—The Plessey Co., Ltd.

Turbine blading materials.—J. Wilkes, Sons & Mapplebeck, Ltd.

W./t. boards.—Park Royal Engineering Co., Ltd.; Veritys, Ltd.; W. McGeoch & Co., Ltd.

W./t. coils.—H. W. Sullivan, Ltd.; Gambrell Bros., Ltd.; Radio Instruments, Ltd.

Motor convertors.—Brush Electrical Engineering Co., Ltd.

Electric crane.—T. Broadbent & Sons, Ltd.

Ventilating fans.—Newton's Dynamo Works; James Keith & Blackman Co., Ltd.; Veritys, Ltd.

Electric fires.—Berry's Electric, Ltd.

W./t. fittings.—W. McGeoch & Co., Ltd.; J. Stone and Co., Ltd.; Highton & Son, Ltd.; Park Royal Engineering Co., Ltd.

Motor generators and panels.—W. H. Allen, Sons and Co., Ltd.

Cable installation.—G. E. Taylor & Co.

Electric lighting installation.—G. E. Taylor & Co.

600-h.p. motor.—Brush Electrical Engineering Co., Ltd.

Main and auxiliary propelling motors.—Metropolitan-Vickers Electrical Co., Ltd.

Motor-driven submersible pump.—W. H. Allen, Sons and Co., Ltd.

Electric radiators.—Edison Swan Electric Co., Ltd.

Automatic starters, resistances and switches.—Watford Electric & Mfg. Co., Ltd.

W./t. switches and circuit breakers.—General Electric Co., Ltd.; Park Royal Engineering Co., Ltd.; Whipp and Bourne, Ltd.; Veritys, Ltd.

Telephone leads.—Ward & Goldstone, Ltd.

Terminal blocks.—Edison Swan Electric Co., Ltd.

W./t. valve holders.—H. W. Sullivan, Ltd.

W./t. valves.—General Electric Co., Ltd.; Mullard Radio Valve Co., Ltd.; Edison Swan Electric Co., Ltd.

War Office.

W./t. valves.—General Electric Co., Ltd.; British Thomson Houston Co., Ltd.

Electric lighting installations (Cameron Barracks, Inverness).—Watson & Dundas.

Air Ministry.

Battery (North Weald).—Premier Accumulator Co. (1921), Ltd.

Engines and generators (Bicester).—Tangyes, Ltd.

Internal wiring (Upper Heyford).—Read & Partners.

Underground mains (Sutton's Farm).—Watshams, Ltd.

Air-driven generators and spares.—W. Mackie & Co., Ltd.; G. E. Mortley, Sprague & Co., Ltd.

Magnetos and spares.—British Thomson-Houston Co., Ltd.

Receivers.—The Plessy Co. (1925), Ltd.

Syntonisers.—Radio Instruments, Ltd.

Transmitters.—C. A. Carter & Co.

Post Office.

Telegraph apparatus.—Creed & Co., Ltd.

Telephone apparatus.—Ericsson Telephones, Ltd.; International Electric Co., Ltd.; Phœnix Telephone and Electric Works, Ltd.; Siemens Bros. & Co., Ltd.; Standard Telephones & Cables, Ltd.; Sterling Telephone & Electric Co., Ltd.

Testing, protective and miscellaneous apparatus.—Automatic Telephone Mfg. Co., Ltd.; British Thomson-Houston Co., Ltd.; Power Equipment Co., Ltd.

Battery stores.—General Electric Co., Ltd.; C. A. Vandervell & Co., Ltd.

Service boxes.—Horstmann Gear Co., Ltd.

Cable (various).—British Insulated Cables, Ltd.; Callender's Cable & Construction Co., Ltd.; Connollys (Blackley), Ltd.; Hackbridge Cable Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Pirelli-General Cable Works, Ltd.; Standard Telephones & Cables, Ltd.

Compound.—W. H. Keys, Ltd.

Cords for telephones.—British Insulated Cables, Ltd.; Reliance Electrical Wire Co., Ltd.; Standard Telephones & Cables, Ltd.

Cable drums.—Eames Bros.; Hackbridge Cable Co., Ltd.; Siemens Bros. & Co., Ltd.

Ducts.—Albion Clay Co., Ltd.; Donington Sanitary Pipe and Fire Brick Co., Ltd.; Hepworth Iron Co., Ltd.; J. Oakes & Co. (Riddings Collieries), Ltd.; Oates and Green, Ltd.; J. Place & Sons, Ltd.; Standard Brick & Terra Cotta Co., Ltd.

Generating set.—W. Beardmore & Co., Ltd.

Lamps.—General Electric Co., Ltd.

Cable distribution plugs.—Siemens Bros. & Co., Ltd.

H.d. copper wire.—Nevill, Druce & Co., Ltd.; Enfield Cable Works, Ltd.; R. Johnson, Clapham & Morris, Ltd.; Pirelli-General Cable Works, Ltd.; Whitecross Co., Ltd.

Replacing batteries (Blackpool telephone exchange).—Chloride Electrical Storage Co., Ltd.

Manufacture, supply, drawing-in and jointing cable.—London-Purley-Redhill-Reigate: Standard Telephones and Cables, Ltd. Hitchin-Letchworth: Johnson and Phillips, Ltd.

Lift (Manchester H.P.O.).—W. Wadsworth & Sons, Ltd.

Telephone exchange equipment.—Garston (Liverpool): Automatic Telephone Mfg. Co., Ltd. Sub-contractors: Alton Battery Co., Ltd., for batteries; Newton Bros. (Derby), Ltd., for machines. Metropolitan: Automatic Telephone Mfg. Co., Ltd. Sub-contractors: D.P. Battery Co., Ltd., for batteries; Newton Bros. (Derby), Ltd., for charging machines; Crompton & Co., Ltd., for ringing machines. Chancery, Ambassador, Cosham (Portsmouth multi office area), Bishop's Stortford, Roundhay (Leeds), and Synthetic

Ammonia & Nitrates, Ltd. (Norton, near Middlesbrough): Automatic Telephone Mfg. Co., Ltd. Rainham (Essex): Ericsson Telephones, Ltd. Subcontractors: D.P. Battery Co., Ltd., for batteries; Crompton & Co., Ltd., for machines. Lee Green, and E. & F. Beattie, Ltd. (Manchester): Standard Telephones & Cables, Ltd. Horsham: General Electric Co., Ltd. Ecclesfield (Sheffield multi exchange area): Siemens Bros. & Co., Ltd. Royal Berkshire Hospital (Reading), Bristowes Tarvia, Ltd. (S.W.1), Trades Union Congress and Labour Party (S.W.1), and Liptons, Ltd. (E.C.1): Automatic Telephone Co., Ltd.

Two- and four-wire repeater station equipment.—Halesworth: Standard Telephones & Cables, Ltd. Taunton: General Electric Co., Ltd.

Spark transmitter (Seaforth wireless station).—Radio Communication Co., Ltd.

CROWN AGENTS FOR THE COLONIES.

Cables.—St. Helens Cable & Rubber Co., Ltd.; British Insulated Cables, Ltd.

Electrical material.—General Electric Co., Ltd.

Switching equipment.—Metropolitan-Vickers Electrical Export Co., Ltd.

Telegraph materials.—Siemens Bros. & Co., Ltd. Bullers, Ltd.

Telephone material.—Standard Telephones & Cables, Ltd.; Peel-Conner Telephone Works, Ltd.

Train-lighting spares.—Pritchett & Gold & E.P.S. Co., Ltd.; Chloride Electrical Storage Co., Ltd.; J. Stone and Co.

Transformers.—British Electric Transformer Co., Ltd.

Turbine, &c.—Sir W. G. Armstrong, Whitworth & Co., Ltd.

H.M. OFFICE OF WORKS.

Wiring Marlborough House, S.W.—H. J. Cash & Co., Ltd.

Wiring Princes Risborough Laboratory.—Electrical Installations, Ltd.

Transformers, National Physical Laboratory.—British Electric Transformer Co., Ltd.

Grimsby.—Electricity Committee. Recommended:—

Balancer, switchgear, and cable work in connection with Deansgate sub-station (£505).—J. H. Holmes & Co., Ltd.

Irish Free State.—Department of Posts and Telegraphs.

Telephone cabinets.—Siemens Brothers & Co., Ltd.

Cable racks, various.—Standard Telephones & Cables, Ltd.

Dials (for automatic telephones).—Peel-Conner Telephone Works, Ltd.

Electric lamps.—Cossor, Ltd.; Sphinx Electric Supplies, Ltd.

Electric motors.—General Electric Co., Ltd.

Stay-rods.—Bayliss, Jones & Bayliss, Ltd.

Telephone wire.—Fernand Espir.

Kettering.—Electricity Department. Accepted:—

E.h.p. and l.p. armoured cables.—Union Cable Co., Ltd.

1,000-kVA transformer.—British Electric Transformer Co., Ltd.

300- and 250-kVA transformers.—Brush Electrical Engineering Co., Ltd.

King's Lynn.—

Electrification of the new sugar-beet factory. The installation will include some 84 electric motors (approx. 2,138 h.p.), with the necessary control gear, main switchboard, and the complete electric lighting installation of the factory.—Mann, Egerton & Co., Ltd.

London.—STEPNEY.—Electricity Supply Committee.

Centrifugal oil purifier (£116).—Empson Centrifugals, Ltd. (Recommended.)

2 tons plumber's solder (£284).—H. B. Barnard & Sons. (Accepted.)

2 tons sheet lead (£71).—Page, Calnan & Co., Ltd.

Works Committee.

Electric ash hoist, with steel supporting structure (£268).—London Hoist & Machinery Co. (Recommended.)

The EDISON SWAN ELECTRIC CO., LTD., has received contracts for accumulators from the London County Council, and for No. 2 E.C.C. dry cells from the Metropolitan Railway Co.

LAMP CONTRACTS.—The contract for "Cosmos" lamps received recently by Metro-Vick Supplies, Ltd. (see ELEC. REV., April 15th, p. 604), was placed by the London & North-Eastern Railway Co., and not the L. & N.W.R. Co.

Mansfield.—CORPORATION.—The Corporation last week decided to accept the tender of the Netherlands Cable Works, Ltd., for the supply of low-pressure cables. It is stated that the quotation was 20 per cent. below those of British firms.

Portsmouth.—Electricity Committee. Recommended:—

Installation of coal-handling plant at power station (£13,460).—Babcock & Wilcox, Ltd.

Reigate.—Corporation. Accepted:—

One 6-cylinder 1,715 b.h.p. Mirrlees-Diesel engine.—Mirrlees, Bickerton & Day, Ltd.

It is stated this will be the largest oil engine supplied to any electricity undertaking in this country.

Southend-on-Sea.—Town Council. Accepted:—

E.h.p. cables for the linking-up of the Leigh, London Road, and Thorpe Bay sub-stations (£31,752).—International Combustion, Ltd.

Five police and fire-alarm posts (£237).—Standard Telephones & Cables, Ltd.

De Laval centrifugal oil purifier for Diesel engine (£157).—Alfa De Laval Co., Ltd.

Swinton and Pendlebury.—Urban District Council. Accepted:—

H.p. cubicle (£182); a.c. l.p. switchboard (£450).—General Electric Co., Ltd.

Tynemouth.—Electricity Committee. Accepted:—

Meter boards.—J. Pelton.

Three 250-kVA transformers (£597); one 500-kVA transformer (£335).—Bruce Peebles & Co., Ltd.

ELECTRICITY COMMITTEE.—The electrical engineer reported at a meeting of the Committee that a tender for cable from a Dutch firm was £483, as compared with £587, the lowest British quotation. The Committee decided that when small supplies of cable are required, foreign tenders shall be invited.

Weymouth.—Housing Committee. Accepted:—

Wiring 94 houses on the Westham estate (£5 10s. per parlour house and £5 per non-parlour house) (screwed steel-tube system).—H. V. Bennett & Co.

Forthcoming Events.

Institution of Engineering Inspection.—Friday, April 29th. Royal Society of Arts. 7.30 p.m. "The Stress-strain Diagram and its Application to the Testing of Rolling Stock Drawgear." Mr. L. H. Evans.

Royal Institution of Great Britain.—Friday, April 29th. 9 p.m. "Wireless Transmission and the Upper Atmosphere." Dr. E. V. Appleton.

Junior Institution of Engineers.—Friday, April 29th. 39, Victoria Street, S.W. 7.30 p.m. "The Design and Balancing of Three-phase Low-tension Distribution Systems." Mr. W. F. Cooper.

Friday, May 6th. 7.30 p.m. Question and discussion evening.

Society of Engineers.—Monday, May 2nd. Burlington House, W. 5.30 p.m. "The Internal Combustion Boiler." Mr. O. Brunler.

Royal Society of Arts.—Monday, May 2nd. 8 p.m. Cantor Lecture. "The Measurement of Light." Mr. J. W. T. Walsh. (Lecture II.)

Röntgen Society.—Tuesday, May 3rd. 32, Welbeck Street, W.1. Ordinary meeting.

Institution of Civil Engineers.—Tuesday, May 3rd. London, S.W. 6 p.m. James Forrest Lecture. "Some Recent Services of Metallurgy to Engineering." Prof. H. C. H. Carpenter, F.R.S.

Association of Supervising Electrical Engineers.—Tuesday, May 3rd. 39, Victoria Street, S.W. 7.15 p.m. "Items of Practical Importance in Mining Electrical Engineering." Mr. E. J. Davies.

Institution of Electrical Engineers.—Thursday, May 5th. London. 6 p.m. Annual general meeting.

(Wireless Section).—Wednesday, May 4th. London. 6 p.m. Ordinary meeting.

(South-Midland Students' Section).—Tuesday, May 3rd. Annual general meeting.

Chemical Engineering Group.—Friday, May 6th. Imperial College of Science, South Kensington, S.W. 6 p.m. Annual general meeting. 8 p.m. "Chemical Fire Extinguishers." Dr. W. R. Ormandy.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

U.L.A. portable electric tools.

"D" type conduit clips as originally handled by Massey and Rothschild, of Birmingham.

ALUMEL wires (aluminium alloys, known also as Hoskins' alloy).

LANGWELL electric light fittings.

PERKINS YANKEE switches.

CLIMAX vacuum cleaners.

We also wish to know:—

The present address of the Continental Automatic Telephone & Electric Co. (spare parts are wanted).

Whether any agency exists in this country for the Estate Stove Co., U.S.A.

Notes.

The Southern Railway Contract.

In the House of Commons on Tuesday last, in reply to a question by Mr. R. Morrison (Lab.), Sir B. Chadwick, Parliamentary Secretary to the Board of Trade, said that he had no information regarding the Southern Railway contract beyond what had appeared in the statements of the Railway Company and the General Electric Co., Ltd. They appeared to set out all the essential facts, and he did not think a special inquiry would be likely to serve any useful purpose.

Accident.

An explosion occurred in an underground electric chamber in Falcon Square, Aldersgate Street, E.C., just before noon on April 25th, and the electricity supply in the surrounding area failed. Three electricians employed by the City of London Electric Lighting Co., Ltd., were in the chamber, and one of them, who was seriously burned about the face, was conveyed to St. Bartholomew's Hospital. The electricity supply was resumed shortly before 1 p.m.

Poplar Electricity Undertaking.

The new generating station of the Metropolitan Borough of Poplar, which is described elsewhere in this issue, was thrown open for inspection on Monday morning last, April 25th, when Sir Andrew Duncan, chairman of the Central Electricity Board, performed the opening ceremony; the speeches were amplified by means of Graham "Amplion" loud-speakers, and an exhibit of domestic electrical apparatus was arranged by the G.E.C., which also demonstrated a 10-kW incandescent lamp. A very large company subsequently assembled at the Hotel Cecil for luncheon, the speakers being Sir Andrew Duncan, Councillor C. W. Key, chairman of the Electricity Committee, Alderman George Lansbury, Mr. J. H. Bowden, engineer and manager of the undertaking, Alderman Samuel March, Sir Duncan Watson, Mr. Frank Hodges, Councillor R. Bond, vice-chairman of the Electricity Committee, Sir Hugo Hirst, and Mr. Geo. C. Usher. With coal of 11,000 B.th.u. thermal value, suitable for mechanical stoking, costing 20s. per ton (which is equivalent to the purchase of 102,700 B.th.u. per one penny), the existing plant's fuel consumption per kWh delivered to the feeders is at the rate of 33,000 B.th.u., the cost being 0.323d. per kWh. With coal of a similar thermal value, but costing 16s. per ton and fired in the pulverised form (which is equivalent to the purchase of 128,000 B.th.u. per one penny), the new plant will, it is estimated, be capable of delivering energy to the feeders at a cost of 0.143d. per kWh. Thus, a reduction of fuel cost of 0.18d. per kWh is anticipated. A condition of the contract having been that a proportion of the cost should be expended locally, it was decided to install one Bradley pulverising equipment, which is of American origin, but was made locally by the East Ferry Road Engineering Co.

Educational.

The Polytechnic, Regent Street, Electrical Engineering Department.—A special course of six lectures on the "Thermionic Valve and its Uses in Wireless Circuits," will be delivered by Mr. W. H. Date, on Wednesdays, commencing May 11th, from 6.30 to 8.30 p.m. On Thursdays, commencing May 12th, at 6.30 p.m., Mr. W. J. Bolton will deliver a special course of lectures on "Electrical Engineering Economics." Particulars and syllabus can be obtained from the Director of Education.

Irish Free State Electricity Supply.

The Irish Free State Government's proposal to take over the control of the municipal and other electrical undertakings in the State under the new Electricity Supply Bill, absorbing them as part of the Shannon hydro-electric scheme, and to refuse compensation to the present owners, continues to excite keen indignation in Dublin and other cities and towns, chiefly because of the confiscatory character of the plan. It is held that if the undertakings are to be taken over, full compensation should be paid for the important developments that have been made, largely at the expense of the ratepayers, but in many instances through heavy outlay by public or private companies or private individuals. Mr. McGilligan, the Minister for Industry and Commerce, in a recent speech, contended that there was little danger of contractors being put out of business through the operation of the Government measure, and estimated that in the wiring of houses there would be sufficient work to keep 5,000 men employed for two and a-half years. Assurance has been given that the cost of the Shannon scheme will not exceed the original estimate of £5,210,000. The Minister has sanctioned the raising of a loan of £90,000 for the provision of boiler plant and accessories, this being part of a loan of £475,150 applied for by the Dublin City Commissioners.

In the Dublin Chamber of Commerce recently it was made clear that before the Shannon scheme could pay, the consumption would have to reach 110,000,000 units per annum; Dublin's share of this will be about 50 per cent. The consumption now is calculated at 75,000,000 units, with a possible increase to 80,000,000 in 1929. Extraordinary efforts, the Minister urged, must be made to stimulate demand. He denied that the Dublin power station was to be "seized" with the object of giving cheap power to consumers elsewhere. A clause which he had undertaken to insert in the Bill would provide that the cost of distribution would be proportionate to the liability taken over from the particular area.

At a meeting of the Emergency Committee of the Municipal Authorities' Association of Ireland, a resolution was passed claiming for municipalities that have established electricity undertakings in the Free State the status outlined in the original report of the Government's expert advisers, under which such municipalities were to have the option of taking current from the Shannon or generating it themselves, and were in either event to act as the local distributing authorities.

A new sub-section has been put down providing that where an undertaking to be taken over has received money from the rates, the money still owing shall be repaid by the new undertaker in a number of years.

The Minister also proposes amendments to meet the objections taken by electrical contractors in the Free State to the Bill's provisions as to the purchase and sale of electrical apparatus and appliances. It would appear that the Board of Control is not, as at first supposed, to sell apparatus and appliances under cost, but it is contended that sale at cost would kill the ordinary contractor.

Association of Supervising Electrical Engineers.

The recognised standing of this Association (until lately the National Association of Supervising Electricians) has resulted in many cases of misuse by unauthorised persons of the Association's abbreviation and claims to membership, by persons who either have not been members or have been struck off the roll. In several cases it has been necessary to institute legal proceedings to safeguard the interests of the Association. With a view to avoiding a recurrence of such happenings, it has been decided to issue yearly membership cards, the colour of the cards varying each year and the date of currency being plainly printed thereon. The colour for the year ending December 31st, 1927, is turquoise blue, and persons claiming membership of the Association should be asked to produce their current membership cards. Cases of misrepresentation should be reported to the Association.

Fires.

A fire occurred on April 23rd, at the premises of Messrs. Wigglesworth & Crossley, electricians, Keighley Road, Frizinghall, Bradford. It is believed the fire was due to overheating of a heating appliance, setting fire to the floor and extending to the basement.

A fire occurred on April 14th at the premises of Messrs. H. White & Co., wireless engineers, of Siddals Road, Derby. The building was gutted, and a large quantity of wireless and electrical material was destroyed.

The Batti-Wallahs' Society.

At a well-attended luncheon at the Hotel Cecil, on Tuesday last, Sir Arnold B. Gridley unfolded an original scheme intended to reconcile relations between the consumer, the producer, and the wage-earner—rather to stimulate thought on new lines, than as a completely developed plan. Success, he held, would come if they curbed the spirit of gain and expanded the spirit of service. Mr. A. W. Blake presided, in the absence, through ill-health, of the new president, Mr. G. W. Partridge, who sent a cordial message of apology and good wishes.

Legal.

Wareham Electric Supply Co., Ltd.—In the Chancery Division on April 26th, the petition of Mr. W. E. Weston for the compulsory winding up of this company again came before Mr. Justice Eve. Mr. Galbraith, K.C., appeared for Mr. Edwards, who was the liquidator in the voluntary liquidation of the company commenced in 1923, but stayed. Mr. Edwards knew nothing of the subsequent proceedings, and asked for his costs. Mr. Willis, for the petitioner, said that it had been hoped that the case, which was a serious one, would be investigated fully before his Lordship.

Mr. Justice Eve granted the usual compulsory winding-up order, and directed that Mr. Edwards's costs should be reserved if not paid out of the assets.

International Conference on High-Pressure Systems.

The fourth session of the International Conference on Large Electric High-pressure Systems will be held in Paris from June 23rd to July 2nd next. The Conference is divided into three sections, namely, power production, construction of lines, and working of systems, and thus offers to all its members a rare opportunity of acquiring detailed information on matters of professional interest and to benefit by each other's experience in a much more effective manner than through the medium of books and periodical literature; it also enables them to meet personally and maintain friendly relations of the greatest value. Some 28 countries are represented in the membership. In 1925 a total of 530 members attended the Conference, of whom 242 were manufacturers of electrical material, 251 power distributors, and 37 professors or consulting engineers. Two languages are used at the meetings of the Conference, *viz.*, English and French, and all papers and discussions are translated from the one to the other. Full particulars will be supplied on request by the General Secretary, Mr. Tribot Laspière, 25, Boulevard Malesherbes, Paris, France.

Cables in Mines.

Important evidence relating to electric cables in mines was given recently at the inquest on the victims of the accident at Wharncliffe Woodmoor colliery, near Barnsley. A ripper stated that the electric cable was laid on the ground for about six yards to protect it during the work of ripping. A stone fell and brought down the cable at a point from which it was hung up. The cable fell on the rails and he saw some sparks. The men went to the pit bottom, a walk of about fifteen minutes, to turn off the power. They had been told by the overman to watch the cable, but they were not told how to watch and protect it. They were not told where the switches were to cut the power off. He was satisfied that the cable was cut on the rails. The overman said that at the time of the accident there were no switches between the scene of the fire and the pit bottom. He had given a warning always to have the cable sufficiently and properly covered. The inquiry was adjourned.

Appointments Vacant.

Meter assistant for the Worcester Corporation Electricity Department. Motors and hiring superintendent (£312) for the Borough of Birkenhead Electricity Department. Clerk for the Bingley U.D.C. Electricity Department. Mechanical superintendent (£364) for the Sheffield Corporation Tramways. Junior scientific officer (£279) for the Air Ministry Scientific Research Staff. Sub-station switchboard attendant for the Ilkley Urban District Council Electricity Department. Visiting lecturer of electrical engineering for the London County Council Paddington Technical Institute. Charge shift engineer for the Yorkshire Electric Power Co. Junior technical officers for the Wireless Experimental Depôt of the Royal Aircraft Establishment. Mains engineer for the Calcutta Electric Supply Corporation, Ltd. (See our advertisement pages to-day.)

Institution Notes.

Institution of Electrical Engineers.

South Midland Centre.—The report of the Committee for the 1926-27 session shows that interest in the activities of the Centre has been fully sustained during the session. The Faraday lecture was made the occasion of a joint meeting between the Institutions of Civil, Mechanical and Electrical Engineers, when some 1,150 members and visitors were present, and approximately 100 were unable to obtain admission. The meeting was followed by a conversazione at Birmingham, where the attendance was 360. In co-operation with the Institutions of Civil and Mechanical Engineers, the Committee is progressing as regards establishing a suitable meeting place, and efforts at the moment are being concentrated on obtaining a site in what will be known as a "Civic Centre" of Birmingham. The attendance at ordinary meetings averaged 25; the membership was 1,032, an increase of 50. The new session officers are as follows:—*Chairman*: W. Wilson; *vice-chairmen*: S. H. Holden, G. R. J. Parkinson; *ordinary members of the committee*: G. W. Billingham, W. Burton, R. A. Chattock, Capt. J. Coxon, Prof. W. Cramp, G. M. Harvey, R. G. Jakeman, J. D. Morgan, J. Morton, A. D. Phillips, F. C. Platt, G. Rogers, Dr. A. H. Railing, J. J. Swarsbrick. Wireless Section.—*Chairman*: J. D. Morgan.

Wireless Section.—Four meetings were held, the attendance at which was 28, 120, 41, and 28.

Students' Section.—The meetings numbered 8, and six visits to works, &c., took place.

East Midland Sub-Centre.—Eight meetings were held, and the average attendance was 100. During the winter four visits to works were organised.

Kelvin Lecture.—On April 21st Dr. E. W. Marchant delivered the 18th Kelvin Lecture, on "High-frequency Currents," showing how Kelvin laid the foundations of much of the work on oscillatory currents that was now commonplace, and developing the theory in its application to modern problems. A vote of thanks, moved by Mr. W. B. Woodhouse, and seconded by Mr. Ll. B. Atkinson, was passed by acclamation.

Informal Meeting.—At the meeting held on April 11th, Mr. A. H. Allen was in the chair, when Mr. T. Hodge opened a discussion on "The Maintenance of Small Electric Power Plants." Mr. Hodge's remarks were mainly confined to factory and works installations, but the discussion extended to machine and line troubles in a variety of services. An interesting case of breakdown was described by Mr. Hodge where a 20-h.p. enclosed ventilated motor was set at work to drive several high-speed dry grindstones. After a few weeks the sparking at the brushes became so excessive that there was an occasional flash-over. Tests were made for insulation, and overload, the mica was undercut, the brush position was verified, and apparently everything was in order. Still the trouble remained, until on one occasion whilst the shunt field was excited separately, it was noticed that the gap between the pole faces and the iron of the armature was bridged over by small particles of iron and steel, which in floating about in the air, had been attracted by the magnetic field of the motor, although it was situated some 20 ft. away from the nearest grindstone, and not in any direct line with the dust given off.

In the course of the discussion, Mr. Burnand said that maintenance was not always intelligent. He knew of a case where an engineer regularly took down and cleaned his motors, and there were always many breakdowns, but when he was persuaded to be less zealous the breakdowns ceased. Mr. W. L. Wreford said that starter troubles varied inversely with the cost of the starter. Engineers often would pay for a good motor but would buy the cheapest starter obtainable.

Association of Mining Electrical Engineers.

London Branch.—At the annual general meeting of the London Branch of the Association on April 12th, it was stated that Mr. Humphrey M. Morgans would be the Branch-President for the year 1927-28.

Royal Society of Arts.

The competition of industrial designs this year will be held at the Imperial Institute, South Kensington, S.W. Particulars of the scholarships and prizes offered in connection with it can be obtained from the Secretary; applications for forms of entry, &c., must be sent in between May 2nd and May 15th, and the designs entered are to be forwarded between June 20th and June 22nd.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.

Councillor J. A. Forde, engineer and manager of the Isle of Thanet Electric Supply Co., has been elected vice-chairman of the Broadstairs and St. Peter's Urban Council.

On April 16th Mr. A. M. Dallen, assistant secretary of the Woking Electric Supply Co., Ltd., was married to Miss Kathleen Jose, of Woking.

Mr. S. H. Penning, deputy borough electrical engineer at Woolwich, who has completed 25 years' service with the Corporation, has been presented by the staff with an armchair and a nest of tables.

The Heckmondwike Urban Council has increased the salary of the electrical engineer, Mr. William Parrett, from £330 to £350 per annum.

At the annual spring meeting of the Executive Committee, Mr. Clyde L. Chamblin, of San Francisco, was elected president of the Association of Electragists, International, for a two-year term.

The Marlborough Town Council has decided to pay an inclusive salary of £60 a year to Mr. R. J. Rance for his services as electrical engineer. Mr. Rance is in charge of the installation at the College, from which electricity is supplied.

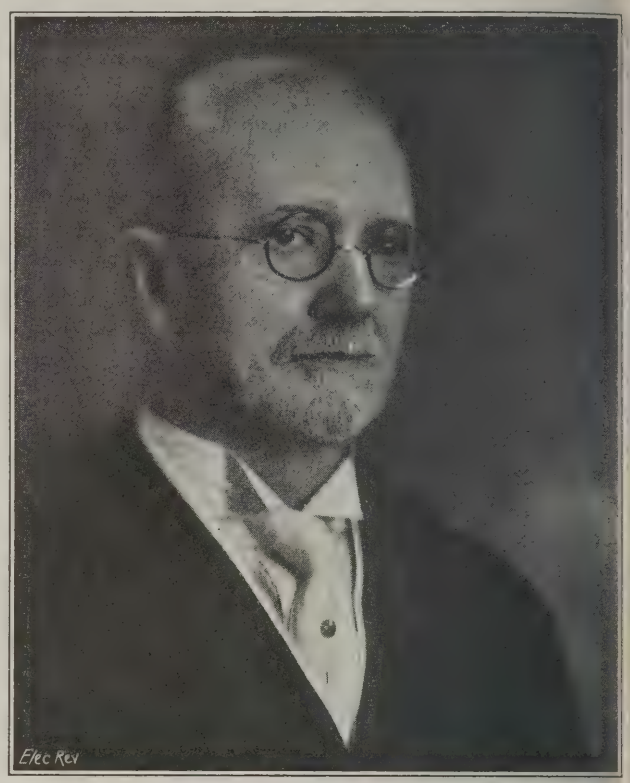
At a recent meeting of the South-East Lancashire Electricity Advisory Board, Alderman W. T. Dagnall (Manchester) was appointed chairman for the ensuing year in the place of Alderman W. Walker, who has joined the Central Electricity Board. Mr. C. D. Taite (Lancashire Electric Power Co.) was appointed vice-chairman.

Mr. J. Christie, of Brighton, sailed for New York on Saturday last by the *Mauretania*.

Mr. G. H. Lock, of the electrical engineering department of Plymouth Technical College, has been married to Miss Winifred Russell.

According to a South African contemporary, Mr. W. B. Phelp, managing director of the British General Electric Co., Ltd., in South Africa, left Cape Town a few weeks ago on a visit to England.

Obituary.—Captain Reginald John Wallis-Jones, O.B.E., T.D.—It was with deep regret that we announced last week the death of Capt. R. J. Wallis-Jones, which took place on April 16th at the Hospital of St. John and St. Elizabeth, London, after a long illness. Capt. Wallis-Jones, who was 64 years old, was educated at Finsbury, at the Central Technical College, and at King's College, London, and commenced his career with the American Brush Corporation and the Brush Electric Light Co. Subsequently he became an installation engineer with Woodhouse & Rawson, and later, as chief electrical assistant to Kincaid, Waller and Manville, he supervised the erection of several electricity works and the construction of the Birmingham-Bournbrook electric tramway.



In 1900, in partnership with Mr. M. C. Dent, he commenced practice as consulting engineer and carried out a number of important installations in London and the provinces. As engineer and manager of the Electric Welding Co., Capt. Wallis-Jones did much to promote the develop-

ment of the Thomson system, and lectured on electric welding at Faraday House for some years.

An ardent supporter of the Territorial Force, Capt. Wallis-Jones was awarded the Territorial Decoration, and he served with the 1/4th Welsh Brigade R.A. in France until he was invalided home; afterwards he became the Controller of Foreign Iron and Steel at the Ministry of Munitions, receiving the C.B.E. His amiable disposition and attractive personality endeared him to a wide circle of friends, and he devoted much time to the work of social and charitable organisations; he was a Member of the Institutions of Civil and Electrical Engineers. He leaves a widow and one daughter.

The funeral took place at Hampstead Parish Church on Wednesday, April 20th. In addition to the members of the family, we noticed amongst those present Sir Edward Manville, M.P., Mr. Ll. B. Atkinson, Mr. Frank Gill, Col. C. B. Clay, Mr. J. E. Kingsbury, Mr. Moss, Mr. G. Scott Ram, Mr. P. F. Rowell (secretary, I.E.E.), Mr. H. M. Sayers, Mr. H. W. Couzens, and Mr. W. J. Tennant.

Mr. T. D. Lockwood.—We learn with very deep regret of the death, on the 5th inst., of that pioneer of telephone pioneers, Mr. Thomas Dixon Lockwood. He was born at Birmingham on December 30th, 1848. His schooldays ended with his eighth year; his education only ended with his death. At eleven years of age he began to work for a living, and he has described himself as "a fairly good machinist by 1865," when his father and family emigrated to Canada. From there T. D. Lockwood went to the United States, taking up any employment which offered. He was successively engaged in making paper in Massachusetts, plate glass in Indiana, and teaching school in Arkansas. By 1871 he had become connected with railway service as telegrapher, ticket clerk, signal operator and engineer on trains. In 1875 his connection with telegraphy became rather more stabilised, first in a private fire alarm system, and later with the Gold and Stock and American District Telegraph Companies. The telephone naturally came within his ken. He began to study and experiment with the telephone in 1878, and in 1879 sought for and obtained a position in the Bell Company with the title of assistant general inspector. In that capacity he undertook much technical work and opened a number of exchanges, but in those early days of the telephone's life the establishment on a firm basis of the Bell patent was of vital importance, and it is easy to realise how the commercial managers turned for assistance to the one man on the staff who had the necessary technical knowledge. Mr. Lockwood's adaptability and practical common sense enabled him to translate scientific definitions into everyday language and convey to Counsel and Court the real meanings of obscure phrases. His success in the company's patent work in these early days led to his being called upon to organise and take charge of a bureau of patents and technical information. This he undertook, though he had no previous knowledge of patent practice or patent law. In 1911 he was appointed general patent attorney to the American Telephone & Telegraph Company, retiring from active work in 1918, when he became their consulting patent attorney. Though mainly engaged in patent work and historical investigations, Mr. Lockwood continued for many years to take an active part in the practical features of telephony and has left his mark upon most of the developments of the earlier years. He was a frequent contributor to the electrical Press of the United States and the author of a number of technical works, including "Practical Information for Telephonists" (1882) and "Hand Book of Electric Telegraphy" (1883). His writings are characterised by clearness, vigour, and precision. His retentive memory and his first-hand knowledge of the telephone from its very first commercial beginnings, ensured a prompt and accurate reply to any question which might be put to him. His loss will be felt amongst a wide circle, and most keenly amongst his personal friends. Mr. Lockwood was a Charter member of the American Institute of Electrical Engineers, and

The late Mr. T. D. Lockwood.

had served as vice-president and one of the Board of Management of that body. He had been a member of our own Institution of Electrical Engineers since 1880.

Mr. C. Canham.—The death has taken place, at the age of 77 years, of Mr. Charles Canham, who for 40 years was engaged at the works of Crompton & Co., of Chelmsford, and for most of that period in the lamp shop.

Alderman W. Walker.—Alderman William Walker, chairman of Messrs. H. A. Davie, Ltd., electrical engineers, Sunderland, died on Saturday last at the age of 62 years. He was an ex-Mayor of the Wearside borough.

Mr. A. N. Dickson.—*World-Radio* records the death of Mr A. N. Dickson, formerly of Nottingham, director of the Capetown Broadcasting Station.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies. Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Johnson & Tanner, Ltd.—Private company. Registered April 16th. Capital, £2,000 in 20,000 ordinary shares of 1s. and 1,000 preference shares of £1 each. To acquire the business of electrical and mechanical engineers carried on by F. Johnson and J. J. Tanner, at 2, Park Terrace, Worcester Park, Surrey. The first directors are:—F. Johnson, "Acadia," Donnington Road, Worcester Park, Surrey, electrical engineer; J. J. Tanner, 207, Hampton Road, Twickenham, electrical engineer (who shall be joint managing directors for 10 years). Remuneration as fixed by the company. Registered office, 2, Park Terrace, Worcester Park, Surrey.

Gorford Bros., Ltd.—Private company. Registered April 14th. Capital, £4,500 in 10,000 founders' shares of 1s. each and 1,000 7½ per cent. cumulative preference and 3,000 ordinary shares of £1 each. Objects:—To acquire the business of engineers and contractors carried on by L. G. Davies and D. A. Davies at Station Buildings, Wealdstone, Middlesex, and to carry on the business of an electric light company in all its branches. The directors are:—L. G. Davies and D. A. Davies, Station Buildings, Wealdstone. Qualification (except permanent directors), 50 shares. Solicitor: H. E. Robertson, Oakfield Corner, Amersham, Bucks. Registered office; Station Buildings, Wealdstone.

Porn & Dunwoody, Ltd.—Private company. Registered April 14th. Capital, £10,000 in 6,000 8 per cent. cumulative preference shares of £1 each and 40,000 ordinary shares of 2s. each. Objects:—To adopt an agreement with Marcel Porn and to carry on the business of mechanical, electrical and

consulting engineers as formerly carried on by him at 72, Fleet Street, E.C. The permanent directors are:—M. Porn, 31, Lancaster Road, N.W.3, engineer (managing director and chairman); T. A. Dunwoody, 103, Foxley Lane, Purley, merchant. Solicitors: Woodbridge & Sons, 5, Serjeant's Inn, E.C.4. Registered office: 72-78, Fleet Street, E.C.4.

Canadian Porcelain Co. (British), Ltd.—Private company. Registered April 22nd. Capital, £500 in £1 shares. Objects: To acquire the sole agency in the United Kingdom for the sale of products of the Canadian Porcelain Co., Ltd. (registered and carrying on business in Canada) and to carry on the business of manufacturers, importers and exporters of porcelain, glass, metals, and similar substances; electrical and mechanical engineers, &c. The provisional directors are:—G. M. Duncan, Embassy Court, 91, Jermyn Street, S.W.1, sales manager; H. J. Wallis, 17, Victoria Street, S.W.1, solicitor's clerk.

Lectro Linx, Ltd.—Private company. Registered April 22nd. Capital, £5,000 in £1 shares. Objects: To acquire from A. E. Chapman, C. R. Cook, and Mrs. E. A. M. Cook, or any of such persons, the benefit of certain existing inventions relating to electrical contact terminals, couplings, wire attachments, and the like, &c. The directors are:—Mrs. E. A. M. Cook (chairman), address not stated; C. R. Cook, 61, Acacia Road, St. John's Wood, N.W.; I. B. Felton, 11F, Hogarth Road, S.W.5. Qualification, 50 shares. Secretary (*pro tem.*): J. G. Martin, 7, Philpot Lane, E.C. Solicitors: Martin & Haslett, 7, Philpot Lane, E.C.

Langs (Wimbledon), Ltd.—Private company. Registered April 22nd. Capital, £1,000 in £1 shares. Objects: To carry on the business of electrical engineers, manufacturers, factors, and vendors of and dealers in all kinds of wireless and electrical apparatus and goods, &c. The subscribers (each with one share) are:—A. E. Bonner, 65, Weston Park, Crouch End, N.8, clerk; H. R. Fisher, 42, Foxham Road, Tufnell Park, N.19, clerk. Qualification, £25. Remuneration, £50 each per annum (chairman £75). Solicitors: Tucker & Co., 40, Finsbury Square, E.C. Registered office: 15, Kingston Road, Wimbledon, S.W.

Official Returns of Electrical Companies.

Central Electric Development Co., Ltd.—Return dated January 14th, 1927. Capital at date of return, £1,500 in ordinary shares of £1 (increased February 3rd, 1927, to £2,000 in 500 preference and 1,500 ordinary shares of £1 each). 1,500 ordinary shares taken up. £1,400 paid. £100 considered as paid. Mortgages and charges, nil. Return of allotments, made up to February 28th, 1927, shows a further 160 preference shares allotted for cash and fully called up.

Horley and District Electricity Supply Co., Ltd.—Capital, £20,000 in £1 shares. Return dated December 31st, 1926 (filed March 7th, 1927). All shares taken up. £10,262 paid. £2,000 considered as paid. £7,738 in arrears. Mortgages and charges at date of return, nil. Since registered: Series of £2,500 debentures (part of £5,000 authorised) issued January 28th, 1927.

Issue on April 9th, 1927, of £2,500 debentures, part of a series already registered.

Kingsmill Art Metal and Electrical Co., Ltd.—Capital, £5,000 in £1 shares. Return dated December 7th, 1926. 4,502 shares taken up. £2 paid. £4,500 considered as paid. Mortgages and charges, £515.

Strange & Sons Electrical Engineering Co., Ltd.—Capital, £200 in £1 shares. Return dated December 31st, 1926 (filed February 3rd, 1927). 32 shares taken up. £32 paid. Mortgages and charges, nil.

Permac, Ltd.—Capital, £100 in 1s. shares. Return dated December 31st, 1926 (filed March 22nd, 1927). All shares taken up. £100 paid. Mortgages and charges, nil.

Norton Wireless Co., Ltd.—Debenture dated March 14th, 1927, to secure £1,000, charged on the company's property, present and future, including uncalled capital. Holder: Matilda Parks, 65, Douglas Street, Deptford, S.E.

Charles White Electrical Co., Ltd.—Capital, £3,000 in 1,000 "A" and 1,000 "B" shares of £1 each. Return dated December 17th, 1926. 1,550 "A" and 1,000 "B" shares taken up. £1,050 paid, £1,500 considered as paid. Mortgages and charges, nil.

Belshaw & Co., Ltd.—Capital, £3,000 in 2,500 7 per cent. preference and 500 ordinary shares of £1 each. Return dated July 30th, 1926 (filed March 15th, 1927). 2,000 preference and 500 ordinary shares taken up. £2,500 considered as paid. Mortgages and charges, nil.

Wireless Lights Syndicate, Ltd.—Capital, £10,500 in 10,000 ordinary shares of £1 each and 10,000 deferred shares of 1s. each. Return dated December 30th, 1926. 10,000 ordinary and 5,000 deferred shares taken up. £10,000 paid on the ordinary shares. £250 considered as paid on the deferred shares. Mortgages and charges, nil.

Ernest F. Moy, Ltd.—Particulars filed of £7,500 debentures authorised by resolutions of December 8th and 21st, 1926, and covered by trust deed dated April 5th, 1927, charged on certain leasehold properties in Camden Town and St. Pancras and on the company's other assets, present and future, including uncalled capital, the amount of the present issue being £6,000. Trustees: C. G. Fox, 76, West Hill, Highgate, and P. H. Bastie, 7, Coniston Road, Muswell Hill, N.

West Wilts Electric Light and Power Co., Ltd.—Capital, £35,000 in 2,000 preference shares of £5 each and 25,000 ordinary shares of £1 each. Return dated December 7th, 1926 (filed March 17th, 1927). 1,700 preference and 21,821 ordinary shares taken up. £30,321 paid. Mortgages and charges, nil.

Correcta Light Co., Ltd.—Capital, £7,000 in 6,500 preference shares of £1 each and 10,000 ordinary shares of 1s. each. Return dated February 25th, 1927. 3,450 preference and 10,000 ordinary shares taken up. £2,453 paid on 2,453 preference shares. £1,497 considered as paid on 997 preference and 10,000 ordinary shares. Mortgages and charges, nil.

Mawdsleys, Ltd.—Capital, £20,000 in 13s. 4d. shares. Return dated November 15th, 1926. 26,500 shares taken up. £9,666 13s. 4d. paid, £8,000 considered as paid. Mortgages and charges, £7,000.

Brecknell, Munro & Rogers, Ltd.—Capital, £150,000 in 2,200 preference shares of £5 each, and 278,000 ordinary shares of 10s. each. Return dated January 27th, 1927. 2,058 preference and 174,829 ordinary shares taken up. £90,673 10s. paid (being £5 per share on 2,058 preference and 10s. per share on 160,767 ordinary shares), £7,031 considered as paid on 14,062 ordinary shares. Mortgages and charges, nil.

Robert W. Blackwell & Co., Ltd.—Capital, £50,000 in £1 shares. Return dated January 12th, 1927. All shares taken up. £18,338 paid, £31,662 considered as paid. Mortgages and charges: £14,000.

Wardle Engineering Co., Ltd.—Capital, £25,000 in 10,000 preference and 15,000 ordinary shares of £1 each. Return dated December 21st, 1926. 5,765 preference and 7,306 ordinary shares taken up. £12,971 paid, £200 considered as paid. Mortgages and charges: £4,000.

C. F. Elwell, Ltd.—A. C. Lucas, of 167, Strand, W.C., ceased to act as receiver and manager on April 1st, 1927.

Woking Electric Supply Co., Ltd.—Issue on April 11th, 1927, of £40,000 debentures, part of a series already registered.

City Notes.

Prospectus.

Baird Television Development Co., Ltd.—This company came before the public on Monday last with an issue of 100,000 10 per cent. preferred participating ordinary shares of £1 each and 100,000 deferred ordinary shares of 1s. each, each of the former shares carrying the right to take one of the latter. The full particulars of the company were given in our "New Companies Registered" column, April 8th, p. 568, to which we refer our readers. The list of applications was to close on or before Wednesday last, April 27th, so that any comment here will have less influence than might otherwise have been the case. It may be stated, however, that the company, which has been formed particularly "to develop commercially" the Baird Television and other inventions, acquires the sole right to "exploit" the Baird inventions for Television, invisible ray, speaking films, and other purposes in the United Kingdom of Great Britain and Northern Ireland, the English Channel Islands, the Isle of Man, and the Irish Free State, and a 66⅔ per cent. interest in the net proceeds arising from and payable to Television, Ltd., in respect of the sale and exploitation of the Foreign and Colonial rights. The prospectus refers to the demonstrations that have been given of the invention, its possible uses, and a statement of estimated revenue and profits. Mr. J. L. Baird, the inventor, will be chief technical consultant and a joint managing director for a period of five years, and Mr. O. G. Hutchinson, who has been associated with him in his work, will be a joint managing director for a like period. The purchase price is £20,000 payable to Television, Ltd., by the allotment of the remaining 400,000 deferred shares (1s.) in the new company. After paying all preliminary expenses, the net proceeds of the issue will be approximately £89,500. The vendor company is taking no cash payment, and it has underwritten 32,000 of the ordinary shares. We need say little about the issue itself owing to the closing date, and it is obvious to every reader of the REVIEW that it is an investment of the most speculative and uncertain kind and one which, in our opinion, is made quite prematurely. Whilst, as our pages have shown, progress has been made towards attaining ultimate success, the work is still in the experimental stage, and no particulars have yet been published with regard to the construction of the light-sensitive cell which is the essential feature of the system.

Since the above was written, it has been announced that the list of applications was closed on Monday.

Shropshire, Worcestershire and Staffordshire Electric Power Co.

The net receipts for the past year amounted to £232,170, as compared with £218,066 for 1925. After deducting expenses, debenture interest, &c., and adding £50,615 brought forward, there is a sum of £144,969 available (against £140,286). It is proposed to distribute this as follows:—To reserve, £50,000; 6 per cent. preference dividend, £21,000; dividend of 8 per cent. on the "A" ordinary shares, £4,000; dividend of 7 per cent. on the "B" ordinary shares, £24,500; carried forward, £45,469. The Bill providing for the merger of the separate and general undertakings of the company has received the Royal Assent, and the report includes an amalgamated balance sheet. The reserve now totals £341,948, and the aggregate capital expenditure amounts to £2,368,148, the expenditure during the past year being £398,483. Investments in allied companies at cost stand at £114,805, and Government securities at £71,145. To provide capital for the development of the business issues of 50,000 6 per cent. cumulative preference shares, 10,685 "A" ordinary shares, and 192,137 "B" ordinary shares, all of £1 each, were made, at a net premium of £3,774, which has been written off the commission, &c., on capital issues. Supplies by overhead lines have now been made available in Evesham, Droitwich, Astwood Bank, and many smaller towns and villages. The Avon Valley Special Order, authorising the company to supply electricity in parts of Gloucestershire and Warwickshire, has been confirmed. The company has acquired the share capital of the Ludlow Electric Light Co., Ltd., and is applying for an order enabling it to supply electricity in the borough. The chief local offices are being moved from Smethwick to Halesowen. Meeting: May 3rd.

Companies Struck off the Register.

The names of the undermentioned companies have been struck off the register, and such companies are thereby dissolved:—

Atmospheric Nitrates (Kilburn Scott Patents), Ltd.
Blackpool and Garstang Electric Light Railway Co., Ltd.
Bovey Light & Power Co., Ltd.
Clar-O-Phon Radio Co., Ltd.
Electric Lamp & Bulb Co., Ltd.
Electroscopes, Ltd.
High Temperature Generators (1918), Ltd.
Horsa Electrical Contracting Co., Ltd.
Ivor Electrical Co., Ltd.
Mayfair Light & Power Co., Ltd.
National Conduit & Cable Co., Ltd.
Phillips' Commutator Grinder Co., Ltd.
Pneumatic & Electric Syndicate, Ltd.
Sceando Lamp Co., Ltd.
Searchlight Projectors, Ltd.
Southport Electrical Supply Co., Ltd.
Tubeless Rapid Steam Generator Co., Ltd.

Companies to be Struck off the Register.

At the expiration of three months the names of the undermentioned companies will be struck off the register, unless cause is shown to the contrary:—

Britannic Electrical Co., Ltd.
Enamelled Wires, Ltd.
Froggatt's Electric Lighting Co., Ltd.
Goodall Electric, Ltd.
Grasse & Cannes Electric Syndicate, Ltd.
New Process Electric Lamp Co., Ltd.

Northern General Transport Co., Ltd.

Mr. R. J. Howley, C.B.E., presided at the annual meeting on April 21st, and in presenting the report (*vide* our last issue, p. 650) said that the past year had been the most difficult one in the history of the company. Although, when the mines were reopened, traffic receipts had begun to improve, they were still far from normal. The receipts from investments were lower owing to the passing of the ordinary dividend by the Jarrow Company and the reduction of the Tynemouth Company's dividend from 10 to 5 per cent. An issue of £118,750 ordinary shares was made during the year; the proceeds were devoted to loan repayment, improvements, and working capital. Owing to the opposition of the shareholders of the Sunderland District Transport Co., the proposal to take over that company's omnibus assets and goodwill had not gone through. Competition was still acute, and the company had to bear heavy licence fees; the chairman deprecated the raiding of the Road Fund to balance the Budget.

National Electric Construction Co., Ltd.

The directors report a profit of £22,467 for the past year, and the balance, after providing for debenture interest, depreciation, &c., is £16,991; to this is added £5,390 brought forward, making £22,381. It is proposed to transfer £1,000 to reserve and renewals account (Dewsbury and Ossett tramways), £3,000 to dividend-equalisation reserve, and £6,000 to general reserve. After paying a dividend of 10 per cent., as for 1925, a balance of £5,581 is carried forward. The tramways in mining and industrial districts in which the company is interested suffered severely during the past year, and this will affect the dividends received on investments in the current year.

City Electric Light Co., Ltd. (Brisbane).

The report and balance-sheet for the year ended January 31st, 1927, shows that after making addition to the franchise and purchase sinking fund, renewal, replacement and contingencies account, and the employés' provident fund, there remains a credit balance of £115,712, which, with the balance brought forward from last year, makes a sum of £115,764. Out of this sum was paid an interim dividend in September last, amounting to £57,069, and a final dividend of 5 per cent. on the ordinary shares in proportion to the amount paid thereon, free of State income tax, was recommended, leaving a balance of £50 to be carried forward. The report records the death of Mr. William John Young, a pioneer of the company, and a director since its inception.

Marconi International Marine Communication Co., Ltd.

The accounts for the year ended December 31st last show total receipts of £890,865, as compared with £995,522 in 1925. The net profit, however, increased from £118,979 to £126,132, in spite of the fact that 1925 was an abnormal year owing to the compulsory fitting of ships' lifeboats with wireless, practically all of which was done in that year. The result is therefore considered gratifying. The company suffered loss of revenue on account of strikes, but now that normal conditions have returned orders for equipment show an increase. The shipowners agreed to pay increased amounts to the company on account of the award of higher wages to wireless operators by the Industrial Court. During the past year working arrangements were entered into with the Radio Communication Co., Ltd., and working costs have thereby been substantially reduced. The directors have set aside £20,000 from the profits to meet obsolescence of plant, and propose to pay a final dividend of 5 per cent., making 8¾ per cent. for the year, as against 7½ per cent.for 1925; £18,038 is carried forward. Mr. J. F. O'Malley has been appointed to the board. Meeting: May 5th.

Indo-European Telegraph Co., Ltd.

The report for 1926 states that only two serious interruptions, caused by severe weather, occurred during the year, apart from a stoppage due to a strike of Russian employés. The revenue from all sources increased from £310,345 to £314,007. The profit, after meeting income tax, was £103,125, and a net balance of £16,288 brought forward makes available £119,413. £45,000 is devoted to writing down expenditure upon line reconstruction in Russia and Poland, and £5,244 in writing down the cost of the Persian section, and £15,000 is handed over to the retirement trust fund. A final dividend of £1 2s. 6d. per share is to be paid (making 7 per cent. for the year), together with a bonus of 15s. per share, all free of tax, leaving a balance of £11,669 to be carried forward. The meeting was to be held yesterday (Thursday).

Llandudno and Colwyn Bay Electric Railway, Ltd.

The accounts just published cover the thirteen months to December 31st last, and show a loss of £1,427, against which is placed a surplus of £362 brought forward, leaving a net loss of £1,065. The report states that the results were seriously affected by the permanent-way expenses, high power costs, and legal expenses. Complaint is also made of the adverse effects of motor-omnibus competition. The company secured modification of the Colwyn Bay Council's Bill which sought powers to run motor-omnibuses in the district. Negotiations are in hand with regard to power supply. The company has not yet issued any of the new £100,000 6 per cent. prior lien debenture stock; the more pressing requirements were met by means of a loan of £10,000. The overhead equipment is being completely renewed from Llandudno to Colwyn Bay, and other improvements are under consideration.

Barcelona Traction, Light and Power Co.

Further progress is recorded by this company in the accounts for the past year. The gross revenue was over $4,000,000, and, after meeting all expenses, the net result is a profit of $1,783,882, as compared with $1,248,095 for the previous year. The balance has been applied in paying four quarterly dividends at the rate of 1¾ per cent. on the preference shares, making 7 per cent., and absorbing $1,729,509, leaving a surplus of $54,372, which, together with the amount brought forward, gives a balance of $214,695 to be carried forward.

Vickers, Ltd.

The profit for the past year was £562,284, and a balance of £190,775 is added, making £753,059. After meeting the preference dividends and transferring £200,000 to reserve, it is proposed to carry forward a balance of £134 868; no ordinary dividend is recommended. The result, in view of the dislocation of trade, is considered satisfactory; if conditions had been normal it would have been possible to pay an ordinary dividend. During the year the business was reorganised, and considerable economies were effected. Mr. G. G. Sim, C.S.I. C.I.E., has been appointed secretary, and Mr. F. C. Yapp a member of the Armaments and Shipbuilding Management Board and Messrs. A. Williamson and G. Vickers have been elected special directors. Mr. V. C. Vickers has resigned from the board.

Johnson & Phillips, Ltd.

The directors' report for the past year shows that after charging £15,454 for maintenance, providing for bad debts, &c., the balance at the credit of the profit and loss account is £115,114, as compared with £209,897 in 1925 (after allocating £21,000 to maintenance). To this is added £152,133 brought forward, less £60,000 paid in dividends in May last, making £207,247. From this are deducted directors' fees, &c., debenture interest, debenture sinking fund reserve, income tax, and depreciation of machinery and plant, and an interim dividend of 5 per cent., leaving £127,475. It is proposed to pay a final dividend of 7½ per cent. on the ordinary shares, making 12½ per cent. for the year, as compared with 17½ per cent. for 1925, leaving £82,475 (against £92,133) to be carried forward. The 100,000 new ordinary shares receive their first full year's dividend. The balance sheet shows a capital expenditure of £94,089 during the year, and also includes among the investments a £50,000 8 per cent. debenture in Burndept Wireless, Ltd. Meeting: May 5th.

Calcutta Tramways Co., Ltd.

The total revenue for the past year was £132,723, as against £219,044 for 1925. The addition of £37,703 brought forward makes available £170,426. It is proposed to place £70,000 to depreciation reserve and £2,164 to staff provident fund, and, after paying a dividend of 5 per cent., free of tax (against 7½ per cent.) on the ordinary shares, to carry forward £12,410. The decrease in revenue is attributed to the recurrent communal riots in Calcutta and to the growing competition of independent omnibus owners. To meet the competition the company lowered its fares and the increased traffic is expected to compensate for the reduction. Meeting: May 3rd.

Rangoon Electric Tramway and Supply Co., Ltd.

From the profits of the past year £50,000 is transferred to renewals reserve, £30,000 to cables reserve, £5,000 to fire-insurance reserve, and £10,000 to the low-pressure conversion reserve, leaving a net balance of £60,824, as compared with £47,983 for 1925. An interim dividend of 8 annas per share was paid on the old ordinary shares, and it is proposed to pay a further Rs.1.4 annas per share on these and 14 annas per share on the new ordinary shares, leaving £25,573. The 100,000 new £1 ordinary shares were issued in August last at Rs.16 per share.

International General Electric Co.

The company's report for 1926 shows a net income from sales of $806,753, and a net "sundry" income of $731,554, totalling $1,538,307. The dividends—7 per cent. on the preferred stock and 8 per cent. on the common stock—absorb $1,500,000, and the balance is transferred to surplus, making $11,898,577. The value of orders received fell from $25,710,000 in 1925 to $20,824,000 in 1926, and the value of orders in hand at the end of the year from $9,645,000 to $8,112,000.

Thames Valley Traction Co., Ltd.

The profit for 1926, after providing for all charges, including depreciation and reserve, is £11,120 (against £5.049), to which is added £3,088 brought forward, making £14,208. It is proposed to pay a dividend of 10 per cent. on the ordinary shares (against 6 per cent.), leaving £6,399 to be carried forward. During the year the authorised capital was raised from £75,000 to £100,000, and 5,000 new shares were issued.

Electrical Finance and Securities Co., Ltd.

After meeting debenture interest, fees and expenses, the credit balance for 1926 is £6,647, and the addition of £2,408 brought forward makes available £9,055. A dividend of 10 per cent. is recommended, leaving £2,962 to be carried forward.

Mexborough and Swinton Tramways Co.

After providing for taxation, depreciation, loss on motor-buses, &c., there is a deficit of £353 on the 1926 net revenue account. Against this is placed £1,460 brought forward, and the balance is carried to the next account. No dividend can be paid on the ordinary shares; in the preceding year they received 2 per cent., free of tax.

Howard & Bullough, Ltd.

The recently-issued accounts cover the ten months to March 31st last, and show a profit of £41,927, plus £159,947 brought forward, making £201,874. The final ordinary dividend is at the rate of 10 per cent. per annum for four months, making 8⅓ per cent. for the period, as against 10 per cent. for 1925-26, *i.e.*, the same rate.

Philips Lamps.

According to the *Financial Times*, Philips Incandescent Lamp Factories has issued a dividend of 16 per cent. on the ordinary shares for 1926 and one of 8 per cent. on the preferred shares.

Montevideo Telephone Co.

The directors of the Montevideo Telephone Co. have declared an interim dividend on the ordinary shares at the rate of 6 per cent. per annum, free of tax, payable on May 2nd.

Hopkinsons, Ltd.

The report for the year ended January 31st last is the first since the company's incorporation. A net profit of £72,283 is shown, and of this £11,547 representing profit earned prior to incorporation is transferred to capital account. A final dividend of 5 per cent. (making 10 per cent. for the year) is to be paid on the ordinary shares and £12,224 is carried forward.

At the first ordinary general meeting, Mr. Robert A. Hopkinson, chairman, commented on the strong financial position of the company. He said that the payments of the dividends had been arranged to fall at three-month intervals, *viz.*, preference, January 31st; final ordinary, April 30th; preference, July 31st; and interim ordinary (if any), October 31st. During the past year £25,058 had been spent on new buildings and plant. Included in the extensive development work which had been carried out by the company were the experiments made in connection with the electrical operation of valves from a distance. Considerable attention had also been given to the development of thermostatic valves for controlling the temperature of liquids. The manufacture of feed-water regulators was a new activity of the firm. At the end of 1926 arrangements had been made for the transfer of the business to the new company, and in nearly every case where shares of the old company were held by employés, they were converted to shares in the new company. The report and accounts were unanimously adopted.

Calcutta Electric Supply Corporation, Ltd.

The directors recommend a final dividend of 7 per cent. actual, making a total of 12 per cent. for the year. They also recommend a distribution of bonus shares in the ratio of one new ordinary share for every 10 of the existing ordinary shares. Meeting: May 4th.

Stock Exchange Notice.

Application has been made to the Committee to allow the following to be officially quoted:—

American Telephone and Telegraph Company.—$13,639,500 capital stock.

Western Union Telegraph Co.

The gross revenues for the quarter ended March 31st last amounted to $32,241,077, as compared with $32,705,184 in January-March, 1925. The net income fell from $3,415,646 to $3,236,223.

Associated Gas and Electric System.

The earnings during the year ended February 28th increased by $7,500,115 to $30,131,629. The net earnings rose from $9,135,820 to $13,617,033.

Consolidated Gas, Electric Light and Power of Baltimore.

A dividend of $⅝ per common share has been declared in respect of the quarter ending June 30th.

Stocks and Shares.

Monday Evening.

Thanks to the unexpected reduction to 4½ per cent. in the Bank rate, stock markets have taken on a very cheerful aspect. That monetary conditions would have to become easier in order to allow the Government to exercise substantial economies, was fairly obvious by a close reading of the Budget speech. City opinion regarded a change in the Bank rate as being dependent upon developments in China, and, these not being favourable, the fall last Thursday in the rate came as a surprise. A very pleasant surprise, too, and one that is hailed as the herald to a further decline to 4 per cent. in the fairly near future.

The immediate effect was to put up prices of all investment stocks and shares. Gilt-edged issues led the way, and were promptly followed by such sound industrials as those, for instance, in the cable group. The relief that will be afforded to trade and industry is reflected in the improved values for shares in iron, steel, and other "heavy" companies. Vickers' report, showing an increased profit—the ordinary shares still go dividendless—came at an opportune moment to fan the revival of hopefulness that is noticeable in regard to such industrials. Home Railway stocks were disposed at first to hang back in the advance which affected most of the other markets, but later on, they came into line with the rest.

The Underground Railway stocks and shares were taken in hand by their supporters, and Districts rose to 60½. Expectations of record crowds at the Cup Final last Saturday were supplemented by consideration of the fact that the time is close at hand when traffics will run against those of the General Strike fortnight. The strike started last year at midnight on Monday, May 3rd. The Metropolitan, true to its traditions, was the first line to re-open, which it did (with a very skeleton service) on the Wednesday in the same week. The District and the Tubes "got going" two days later. On Wednesday, May 12th, the strike was declared at an end, but this turned out to be premature, and not until Monday, the 17th, did con-

ditions approach normality. For many weeks afterwards, coal became worse in quality and dearer in price. The District, alone amongst the railway companies, earned the 3½ per cent. dividend which it paid for 1926, and this is the reason why the stock is chosen by the speculative investor of to-day. The Underground Electric Railways of London succeeded in entering the dividend-list with 1½ per cent. on the reorganised share capital, and, since then, the £1 shares have made steady upward progress week by week, standing now at 17s. 6d.

It is interesting to observe a gain of 7½ points in British Electric Traction stock. This brings the price to 150, comparing with 135 at the time, a few weeks ago, when attention was drawn to the "Trust" company character of the undertaking.

No little dust has been raised by the action of the Southern Railway in giving to a Swedish Company the contract for an important order whose execution will provide a good deal of work. The railway has laid especial stress upon the fact that its action was not dictated by considerations of price, although the English tenders were more expensive than the Swedish. The contract has gone abroad owing to the home firms' imposition of conditions that were not stipulated by the foreign manufacturers. In this column, we are concerned only with the financial aspect of the matter, and, in regard to that, it must be recorded that Stock Exchange opinion inclines to the view that the step taken by the Southern Railway has a good deal to be said in its favour, while regret is general at so substantial an order having been placed abroad. The effect upon share-prices is purely negative, in that no changes have occurred. Had the contract been given to British companies, the shares in the undertakings concerned would have strengthened, as a result. General Electrics and other shares in the manufacturing group are unaltered on the week.

Anglo-Argentine Trams are a good market, the second preference being 10s. higher at 76s. 3d. Rumours cluster thickly around the course of the negotiations that are said to be taking place. The 5 per cent. debenture stock has been in demand up to 73, and there is not much floating supply in the market. La Plata Trams are creeping up in price. The 6 per cent. preference, still cum 1s. 6d. dividend that will be deducted on Thursday in this week, stand at 21s. 3d., and the ordinary, in which a hand is being taken by speculators, are 4s. 6d. Mild gambling in the ordinary shares is encouraged by extremely nebulous reports as to the possibility of the company being taken over by a certain group.

Cable stocks and shares have responded to the Bank rate reduction with rises in Anglo-American preferred, Eastern ordinary, Eastern Extensions, and Western shares. Great Northerns advanced a further 5s., to 27½, on the dividend declaration. Globe preference are ⅛ up at 11 in sympathy with the improvement in the best-class stocks. Amongst the telephones, United River Plate are better at 8 13/16. Marconis mark time, and the Marine Company's shares remain at 23s. 9d., the dividend increase, to 8¾ per cent., having been expected, and discounted in advance. Weakness continues to characterise Automatic Telephones, in which the price has slipped back to 47s. 6d. India Rubber shares followed up last week's advance with a fresh rise to 20s. 7½d. Business in the equipment section is quiet.

A violent rise, of 4 points in one afternoon, lifted Brazilian Tractions to 141. Men in the market profess mystification at the current price of the shares, because there is little reason, on the surface, to justify the quotation. Consequently, guesses are made at what may be the explanation for this latest outburst of optimism inspired by Brussels buying. Another share to enjoy a dramatic rise is Barcelona Traction, but, in this case, the spurt from 46 to 52 has a foundation in the issue of an extremely satisfactory report. The directors go so far as to hint at the likelihood of a dividend on the common shares, and in the fairly near future. The Board seems to take a rosy view of prospects which, to the cautious eye, may still take time to materialise into dividends on the common shares. Mexican Utilities hold the gains of a week ago. Nothing has transpired, up to this (Monday) night, in the shape of news about the expected scheme for dealing with the dividend accumulation of arrears on Mexican Light & Power preferred. Meanwhile, private correspondence speaks none too comfortably concerning the state of the distressful country, where brigandage apparently still goes on in certain districts. The obvious reply is, of course, that in Mexico, there always was, and always will be, a measure of lawlessness in the outlying and mountainous parts.

Electricity supply shares are hard in tone, and a few advances have occurred. The Shropshire and Worcestershire report is a good one, the effect being to draw attention to shares in provincial companies that did poorly last year owing to the coal stoppage. It is contended that in the course of a year or two these undertakings will more than retrieve the damage inflicted upon them by the industrial conditions of 1926, and that the buyer of to-day is likely to see a handsome appreciation of prices in the future. Electric Constructions at 30s. are unaffected by repetition of last year's 10 per cent. dividend.

There is nothing much doing in the rubber share market, where only languid interest is taken in the suggestion that the Stevenson restriction scheme shall be abandoned, and that the producing companies shall revert to free selling. The exportable allowance of the rubber-producers that come under the voluntary restriction, will be reduced next week to 60 per cent., but this has led to no accession of business or of interest in the market for rubber shares.

Our Foreign Electrical Trade.

Electrical Exports and Imports during March, 1927.

THE Board of Trade returns of our foreign electrical trade during March record increased imports and smaller exports as compared with the preceding month. While, however, the rise in imports was substantial, the decrease in exports was only about 0.6 per cent. Looking at the export section, it will be observed that the increases predominated in number; most of them were small, but the rises in glow lamps, "other" motors and generators and submarine cable stand out. The second item nearly compensated for the decreases in the other two machinery sections. The increases in the exports of telegraph and telephone cables were more than offset by a drop of £46,594 in the case of insulated wires and cables. Telegraph and telephone apparatus continued the downward movement which commenced in December last. In comparison with March, 1926, the export total shows an increase of over £58,000; the individual items exhibit a number of wide variations. The machinery section improved to a satisfactory extent, but all three cable sections registered large decreases. Unenumerated electrical goods and batteries and accumulators were both well up. The figures for the first quarter show that last year's satisfactory export position is being improved upon.

The following table shows the distribution of our electrical machinery exports during March compared with the figures for the preceding March:—

Destination.	March, 1926. £	March, 1927. £	Inc. or dec. £
European countries	55,646	62,951	+ 7,305
Japan	7,467	23,872	+16,405
South American countries...	33,059	55,299	+22,240
South Africa	51,842	92,908	+41,066
British India	110,330	76,356	−33,974
Australia	111,347	153,280	+41,933
New Zealand	42,101	35,793	− 6,308
Canada	17,752	11,071	− 6,681
Other countries	54,869	66,074	+11,205
Totals	£484,413	£577,604	+£93,191

Turning to the imports, it will be noticed that only three items were lower in value than in February, and that the decreases were of a negligible size. On the other hand, there were some important increases, the chief of which occurred in the two unenumerated sections. Increases of over £10,000 also occurred in batteries and accumulators, insulated wires and cables, and meters and instruments. The comparison with the corresponding month of last year is a reflection of the preceding column, although the increases were generally smaller, and the two decreases larger; there was an increase in arc lamps and parts, where a decrease occurred in comparison with February. The first quarter's import total is well above that of the first quarter of 1926.

The dwindling tendency of re-exports continued.

United States Electrical Exports.

The preliminary figures of the foreign electrical trade of the United States during February, published by *Commerce Reports*, give an export total of $7,009,482, as compared with $6,967,918 in February, 1926. The largest increases occurred in the lighter classes, such as telephone apparatus, electric lamps, batteries, portable tools, and motor-driven household devices. Although the shipments of heavy machinery declined upon the whole, there were increases in some classes, including transforming and converting apparatus, d.c. generators of 500 kW and over, self-contained lighting outfits, small motors, and industrial electric furnaces and ovens. The largest decline occurred in the case of electric railway locomotives, and among other classes which experienced falls were mining and industrial locomotives, a.c. generators, 2,000 kVA and over, switches and circuit breakers, railway motors and radio apparatus.

The Situation in Belgium.

Foreign Electrical Trade Statistics.

MR. J. PICTON BAGGE, Commercial Secretary at the British Embassy, Brussels, has forwarded to the Department of Overseas Trade a report upon the economic situation in Belgium in 1926. (Stationery Office, 4s. 6d. net.) In this a great deal of attention is paid to the financial and monetary problems with which the country was confronted. It is shown that by heroic measures the edifice of public finance was slowly but surely set up, making a firm basis for national economic life. It was recognised that a stable exchange, and therefore industrial and commercial well-being, rested on the basis of a balance of international payments, a balance which could only be secured by intensified production and a highly-developed organisation in all branches of the export trade. A national committee on industrial production was set up, and after examining numerous aspects it published a report dealing with the country's principal industries. Among the matters treated were the organisation of the supply and distribution of electrical power, the utilisation of the country's water power, the scientific organisation of factories, standardisation and specialisation, &c. Belgian industries have already made much progress in production methods since the war. The present position of industry in general is said to be good, and in spite of the difficult conditions the results for the past year were satisfactory.

Electric Light and Power.

The rapid development of the use of electricity continued during the past year. Hesitation upon the part of industry to proceed with the conversion of motive installations was caused by the instability of the currency, but this was compensated for by the demand from the rural districts, stimulated by a shortage of labour and the realisation of the necessity for improved methods of farming. In the province of Antwerp and in the Campine, excellent progress has been made with the electrification scheme. Of the 400 km. of cable to be laid 160 km. has already been completed, and 14 communes have been connected. Similar progress has been made in the provinces of Namur and Limburg. The report embodies a table showing the progress made by the principal electricity supply authorities. At December 31st, 1925, there were 28 power stations, with a total capacity of 630,000 kW, owned by private electric light and power companies; in addition to these the municipal plants in Brussels, Ghent and Liège had a total capacity of 45,000 kW, and a large quantity of power was produced by mining and metallurgical concerns for distribution. The supply companies' output rose from 630 million kWh in 1924 to 790 million kWh in 1925. The load dispatching system inaugurated in the Liège area is gradually extending.

Provincial administrations in provinces where no central power stations exist have decided to install h.p. circuits, with l.p. distribution, in the rural communes. In East Flanders only a few of the communes now remain without electricity, and official forecasts estimate that within five years every commune will be served. Directly electricity becomes available, local farmers install electric lighting apparatus and substitute electric motors for petrol-driven machines. Small-scale farmers are creating a demand for small motors (3 to 7 h.p.) which operate dairy and farm machinery of all descriptions. Oral and practical construction in the handling and repairing of machines is given by public authorities and agricultural associations. The increased use of electricity by the railways is also mentioned.

The Radio Industry.

While the iron and steel industry is dealt with at great length, no mention is made of the electrical manufacturing industries, with the sole exceptions of the porcelain and radio sections. Electrical porcelain is said to be produced in quantities more than sufficient for home requirements, and a good market is found in France. With regard to the radio industry it is stated that a stagnation has been caused in the supplies trade on account of the poor financial position of the broadcasting service, which is thus unable to develop. Negotiations are in progress which, if successful, will give the broadcasting company revenue from the licence fees which at present are retained by the Government. The fees will probably be increased. At present there are only 30,000 licences issued, and listeners are largely dependent upon the British and French services, for the reception of which expensive sets are required. If the arrangement with the State is negotiated the Belgian service will be improved, with a resultant increase in the sale of sets. The report states that at present British sets are too expensive for the Belgian market, which is mainly supplied by Belgian and French manufacturers. There is, however, a good demand for British component parts, the quality of which is superior to French and German makes. Holland practically monopolises the valve market.

Communications.

While but slight progress has been made in the internal telegraph system, cables are being laid for the international telegraph and telephone service between La Panne-Brussels and Herbesthal. Other international telephone lines under construction are those between Brussels and Roosendael and Lille. Between October 31st, 1925, and October 31st, 1926, the number of telephone exchanges rose from 367 to 382, and the number of subscribers from 119,153 and 130,398; new lines totalling 154 km. were erected. The 1927 Budget provides credits of 137 million francs for the development and improvement of the system. Amplifying stations for the Brussels-Luxemburg line are to be constructed at Jemelle and Aubange, and underground cables are to be laid in the Brussels, Antwerp and Liège areas in Flanders and in the provinces of Liège, Limburg and Luxemburg. Cables are also to be laid from Brussels to Charleroi with a branch to Mons. In August last contracts were signed between the Government and the Sociétés Radio Belgique and Goldschmidt for the use of the latter company's transmitting stations for a short-wave public radio-telegraph service which was inaugurated on August 30th. Powerful stations have been erected in the Congo. The 1927 Budget provides 145,000 fr. for the construction of the Ruysselede transmitting station, and 1,300,000 fr. for an electrical sub-station. Credits are also provided for the naval stations at Antwerp and Ostend.

Imports and Exports in 1925 and 1926.

The Belgian Government now publishes monthly statistics of the country's foreign trade in considerable detail, and with the publication of the December issue it is possible for the first time to survey the import and export trade in electrical machinery and apparatus during the past two years. Below are given the weights of such goods imported and exported in 1925 and 1926 with a note of any increase or decrease:—

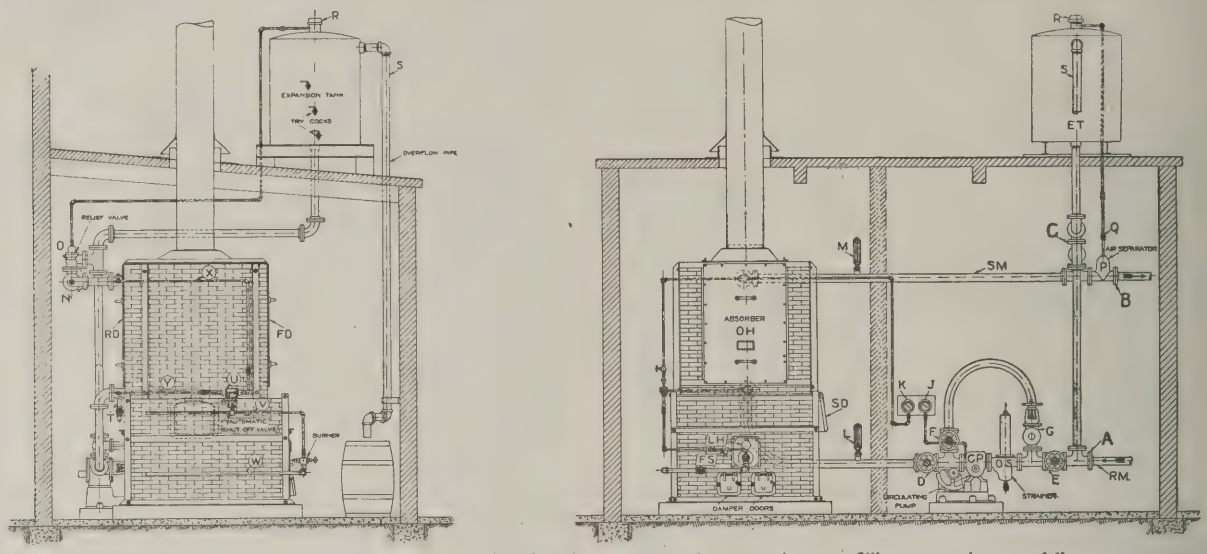
Heat for Factory Processes.

A system of heat transmission with special reference to the cable industry.

THE generation and utilisation of heat in the most effective and economical manner is becoming more and more important as the necessity becomes evident of redu ing manufacturing costs. Except in special cases where favourable circumstances permit the use of electricity, the use of steam heating and direct firing, that is, the direct heating of vessels by means of coal or coke fires, or gas or oil burners, has been until comparatively recently almost universal in all industries. In many instances, however, steam heating and direct firing as a means of applying heat to material under treatment fall very far short of the ideal, and they have been adopted merely because better methods have not been available.

This is as true in cable making as in many other industries, all of which provide numerous instances where vast improvements in efficiency can be effected. Apart from special applications with which other defects become apparent, steam heating suffers from the general disadvantage that the temperatures which can be reached and maintained are dependent on the boiler pressure available and the pressures which the heating vessels can withstand. For instance, a steam pressure of 100 lb. corresponds to only 338 deg. F., and very much higher temperatures are frequently required. Similarly direct firing, although it is less limited in range of temperature, has disadvantages which more than offset its value as a means of obtaining a high temperature. For instance, it is extremely inefficient thermally, it is not conducive to accurate temperature control and often causes high local temperatures which spoil the product and burn the walls of the vessel.

The advantages of using oil for heat transmission, in preference to the above methods of heating, were realised many years ago, and several attempts were made to obtain in practice the obvious theoretical advantages, such as the ability to supply heat to any process at a high temperature without a high working pressure and with an improved thermal efficiency. For the most part these efforts were unsuccessful through a lack of appreciation of the fundamental principles involved, but a heating system believed to be quite satisfactory, embodying the principle of heat transmission by means of oil, has now been developed, and is available for general application in industrial processes. The system referred to is the Merrill patent oil circulation system, which is in the hands of the Kestner Evaporator & Engineering Co., Ltd. Apart from the very large number of installations which have been in continuous operation for several years in chemical works, roofing felt, oil hardening, and other industries in this country and abroad, a large proportion of the cable factories in America have adopted this system, and it is now attracting attention from English manufacturers of cables and insulated wire, for whom several successful installations have already been put down.



Essentially the plant consists of a central oil-heating unit from which the hot oil is distributed through the works, by suitably arranged pipe lines. Fig. 1 shows the arrangement of a typical heating unit, which consists of the furnace in which the oil heater or absorber is mounted, an oil-circulating pump, an expansion tank, and the necessary piping arrangements and fittings.

The design of the absorber is the result of many years of practical experience, and is such, it is claimed, that provided a suitable oil is used there is absolutely no danger of carbonising or burning out of the tubes. The pump ensures positive and rapid circulation of the oil through the system, the expansion tank providing for the change of volume in the oil as it is heated and cooled.

From the heating unit the hot oil is delivered at the point A, to which connection is made by suitable pipe lines to the plant to be heated, and the oil, after passing through the jackets or heating coils, returns to the point B. There is thus a complete circuit from which the only losses of heat are those due to radiation. The application of oil heating in cable and insulated-wire manufacture is largely in connection with the melting and heating of pitch, wax and high-melting-point compounds generally. The rate of heating with the oil-transmission system is claimed to be very much greater, while materials of higher melting points can be used. An existing steam plant, if converted to oil heating, would be capable of a much increased output, and at the same time could treat at a higher temperature, thus improving manufacturing conditions and enabling special compounds to be used.

Oil heating may also be applied with advantage to the heating of h.p. cable impregnators, and an important point in its favour in this connection is the impossibility of moisture finding its way into the cable from the jackets. As is well known, precautions are taken to dry the cable thoroughly before impregnation and to prevent the ingress of moisture at any stage of the process, and yet until quite recently h.p. steam had been employed universally for heating the impregnators. With steam there is always the danger of a slight leak from the jackets into the vessel, the detection of which is not always easy, and which may cause serious damage to the product, whereas with oil, not only is the danger of a leak developing very greatly reduced on account of the low working pressure, but if it did occur it could not do any great harm, and would be easily detected. The same heating unit may be connected to any number of impregnators, and may also be used to advantage for heating the compound storing and mixing tanks.

In conclusion it may be remarked that, apart from the cable industry, oil heating is also successful in use in a number of other industries, for instance, in the manufacture of dyes, roofing felt, synthetic chemicals, varnish, and accumulator cases.

A, B and C, connection points to external system; D and E, isolating valves; F, by-pass valve; G, filling connection; J, delivery pressure gauge; K, outlet pressure gauge; L, inlet thermometer; M, outlet thermometer; O, relief valve; P air separator; Q, air-drain valve; R, filler cap; S, overflow pipe; T, oil drum; U, fuel shut-off valve; V, fuel supply line; W, compressed-air line; X and Y, valve connections; LH, lighting hole; OH, oil heater; FS, oil filter; OS, oil strainer; CP, circulating pump; SM, supply main, RM, return main; ET, expansion tank; RD and FD, absorber inspection doors; SD, furnace inspection door.

Fig. 2 shows the absorber, circulating pump, and other auxiliaris of an actual heating unit of two million B.th.u. per hour capacity installed in a factory in this country.

A New Current Limiter.

A Norwegian Development.

A POPULAR form of electricity tariff in Norway is the fixed charge per annum with no restriction on the period of consumption. This has resulted in the introduction of a current limiter, by Messrs. N. Jacobsen's Elektriske Verksted A/s., of Oslo, Norway, which is claimed to be immune from the disadvantages which are borne by other apparatus of its class, principally that the consumer might be able to derive an unjust advantage from the limiter in the case of heating apparatus, by using it on an intermittent circuit, and the inconvenience caused to the consumer, should his loading be slightly and accidentally increased, in not having sufficient light to see to the necessary reduction of his loading.

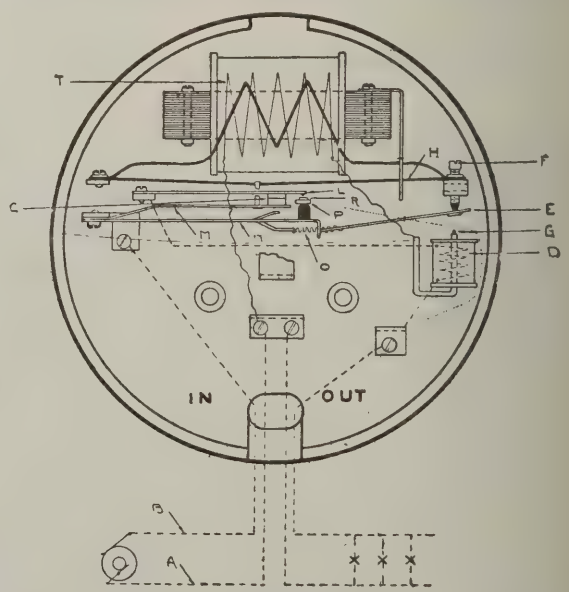

Fig. 1.—Jacobsen Current Limiter.

The instrument, which is designed exclusively for single-phase a.c., consists primarily of an overload relay, contact breaks, and a transformer, the secondary circuit of which embodies a heating wire used in regulating the periodical breaking of the circuit when the loading limit is exceeded. Fig. 1 illustrates the principle of the device. The two supply

eads are taken into the limiter, but A is only looped, and merely supplies the primary of the transformer T. The second wire B is led to the contact breakers, one of which is suspended by the heating wire H, and then passes on through the relay coil D to the consumer's circuit. This relay acts upon the anchor E, which normally is in contact with the screw F, and immediately the loading exceeds a predetermined value it strikes downwards on to the contact G and closes the transformer primary. The springs L and M are normally in contact at C by virtue of the heating wire, from which the lower spring is suspended, and which short-circuits the transformer secondary. The arm N acts upwards against the coupling P, and in its movable end carries an anchor E, which is held off the relay core at G by a spiral spring O. Immediately the loading limit is exceeded the anchor is drawn downwards on to G, and the transformer is coupled up and brought into action. The current induced in the secondary circuit of the transformer then causes the heating wire to become warm and expand, and it immediately sags downwards, allowing the springs L and M to fall. Spring L thereupon makes contact with R, while M moves still further, and first opens the contacts C, whereby the main circuit is broken, and finally strikes against the upper fork of arm N, which is lowered until the tension on spring O is such as to force the anchor E back against the regulating screw contact F, when the transformer is again deprived of current; the heating wire then cools, the spring M once more closes the main circuit, and the contact R puts in circuit a resistance wire (dotted line) laid parallel to the relay coil. The object of the last operation is to compensate for the "rush" current when the main circuit is closed, otherwise the apparatus would not come to rest until the load was reduced to a value far below that of the load limit. With this parallel connection, of course, the whole of the current does not act upon the relay coil at once, but with the load at 50 or 100 per cent. in excess of the limit the anchor E will be thrown over again immediately. This occurs so quickly that a metal filament lamp, for instance, is not given time to light up at each closing of the circuit, while the intervening periods of darkness are of constant duration. When the excess loading is great the limiter does not permit any energy to pass through the circuit at all, but acts as if the whole installation were uncoupled by means of an ordinary switch. Normally the entire load must pass through the relay coil, and in the case of small overloads the circuit will remain closed between the breaks for a sufficient time to allow the loading to be reduced. The current limit is regulated by means of the screw F. The device is enclosed in an iron cover, which is secured by a lead seal in front on the outer side of the screw nut. The limiter is stated to have been tested with approximately one million breaks at 30 A on a 220-V service, and to be capable of breaking 30 A for a very long period without sustaining any damage. The regulation is claimed to be absolutely constant, and the employment of this type of limiter has reduced the control and repairing expenses at the electricity works by quite an appreciable amount.

Messrs. Jacobsen's representative in this country is Mr. C. H. Smith, London.

Economic Value of Increased Steam Pressure.

Some results of investigations on the effects of steam-pressure increase on operation and plant efficiencies and costs, with considerations on the selection of particular pressures.

By H. L. GUY.

(*Abstract of a Paper read before the* North-Western Branch *of the* Institution of Mechanical Engineers.)

In the pursuit of increased efficiency of steam power plant in the last decade, the range of steam conditions with which it operates has been increased and the character of the cycle employed has been modified. The success attending these developments, coupled with the increase in size of the plant involved and the greater skill with which it is operated, is illustrated by the fact that in the last 10 years the thermal efficiency of the best power stations has been improved by some 50 per cent. Steam pressures have been materially increased, steam temperatures have shown some advance, and the vacua obtained with given water tempera-

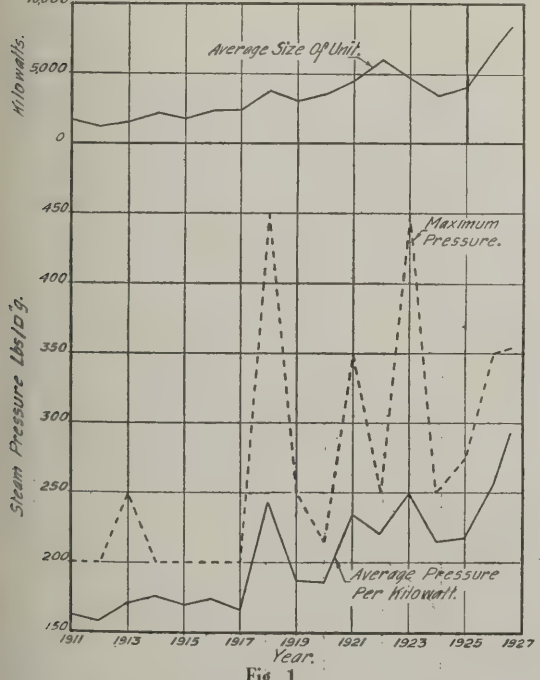

Fig. 1.

tures have been increased. Of these the change in steam pressure, still in a state of flux, is perhaps the most striking; the maximum steam temperature has in recent time shown a tendency to become stationary, and vacua, with given water temperatures, if anything, appear to be slightly reducing.

The steam cycle itself has changed as the result of the general adoption of regenerative feed heating, by the extraction of steam from the turbine at successive points in its expansion, and also, in some cases, by taking the steam out of the turbine after partial expansion and resuperheating it before returning it for expansion to be completed. The advantage to be derived from both these operations is a function of the initial steam pressure. The way in which the average steam pressure adopted has changed with time, based on the orders received by the firm with which the author is associated, is shown in fig. 1. The maximum pressure for which plant was ordered is also plotted. The first considerable peak shown is of historical significance, representing, as it does, the first commercial installation employing a considerably increased steam pressure, multiple-stage turbine or "regenerative" feed heating and resuperheating.

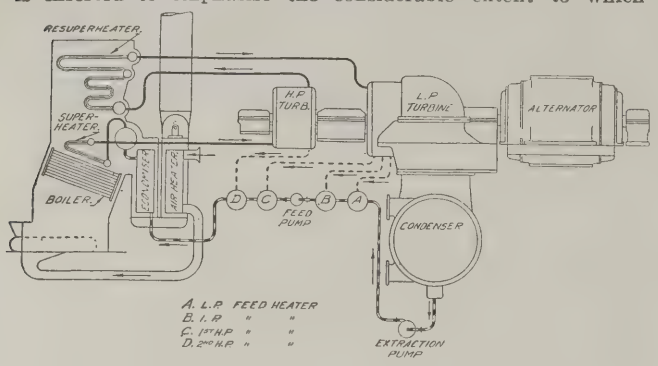
(1). Reheating to 500 deg. F.
(2). " 709 "
(3). " 725 "

In Table I certain particulars are given of notable h.p. stations; this list is illustrative rather than exhaustive, and is inserted to emphasise the considerable extent to which



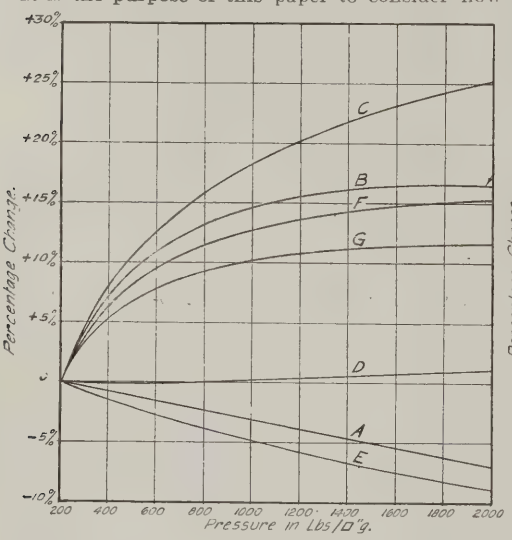


Fig. 2.

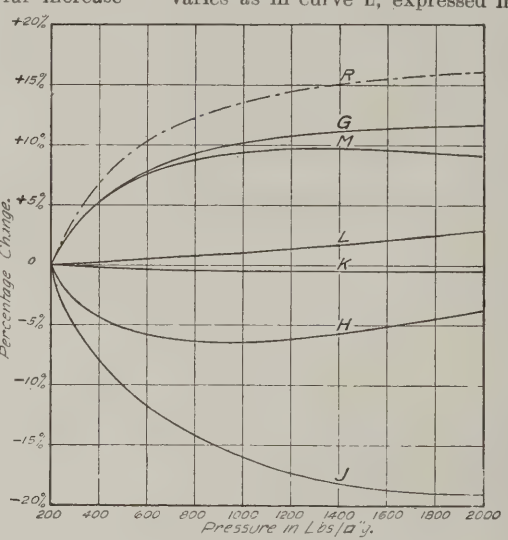
this movement has grown in all parts of the world and some of the mile-stones on the way.

It is the purpose of this paper to consider how far increase of steam pressure affects the efficiency of operation; some of its effects on the character and cost of the individual units comprising the whole plant, and what guidance can be obtained in the selection of the pressure appropriate to any particular case. Fig. 2 illustrates diagrammatically the type of complete installation considered.

700 deg. F., stop valve; 29-in. vac., exhaust.

Fig. 3.



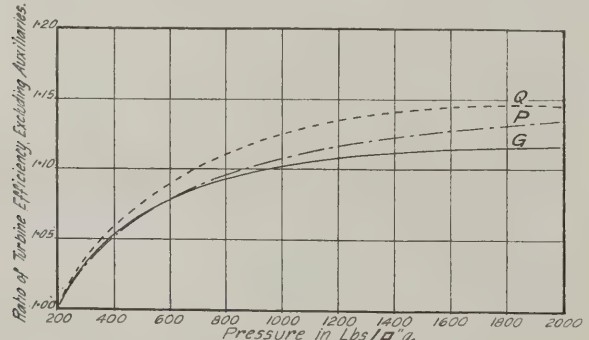


Fig. 4.

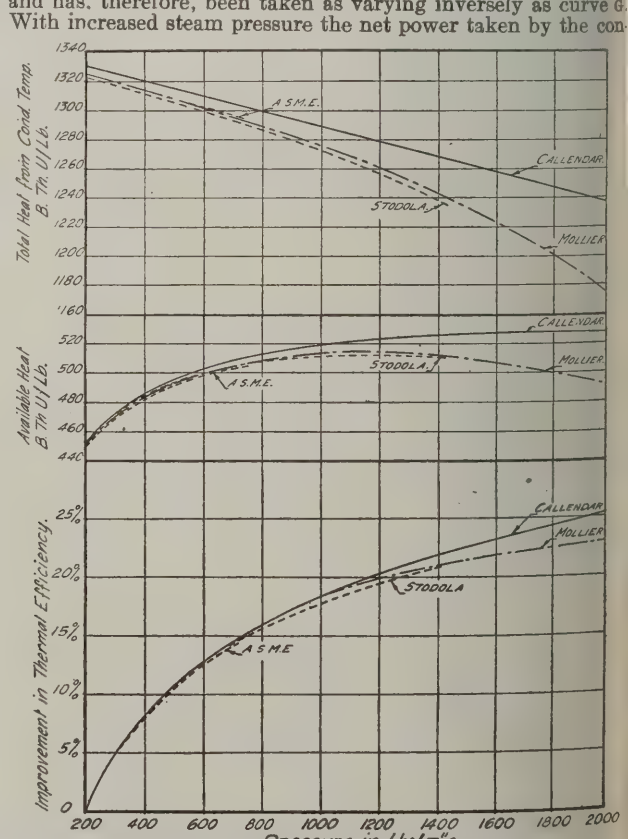
In order to consider the gains to be expected from the adoption of increased pressures in a simple condensing-turbine installation, steam will be assumed to be supplied to the machine stop valve at a normal total temperature of 700 deg. F. In commercial operation the possibility of the total temperature being 50 deg. F. above normal, necessitates plant suitable for a maximum total temperature of 750 deg. F.; operation with a moderate pressure for a given total temperature is rather more safe than at high pressure, for as the pressures increase so do the maximum stresses in certain parts of the plant. Maintaining the superheat constant and imagining the total temperature to increase with the pressure is inexcusable. A vacuum of 29 in. Hg. with 30 in. barometer has also been adopted. The calculations throughout are based on Callendar's enlarged steam tables.



Q, 700 deg. F., 28-in. vac.; P, 900 deg. F., 29-in. vac.
G, 700 deg. F., 29-in. vac.

Fig. 5.

Steam at 200 lb./sq. in. g. pressure is taken as a basis, and an individual stage efficiency of 80 per cent. chosen for dry steam in the turbine designed for this condition. The variation with pressure of the total heat supplied to the steam, expressed as a ratio of that for 200 lb./sq. in. is plotted in curve A, fig. 3. Curve B gives the variation of availabl adiabatic heat drop; while C, the ratio of B and A, gives th first approximation to the variation in thermal efficiency The correction for the variation in the reheat factor is give in D; E shows the variation in efficiency due to the cor condensation which takes place as expansion proceeds, made a the rate of 1 per cent. loss in efficiency for each 1 per cent mean wetness in the stage considered, approximating the los in a straight condensing turbine; F is the corrected efficienc curve from D and E, and G gives the final efficiency, correcte for the remaining turbine losses at the rate of 1 per cent increased loss for each time the pressure is doubled.

This relatively small rate is obtainable only in plant o reasonable size for the speed at which it operates, which sug gests the expedient of gear driving the h.p. end of the tur bine, in order to keep such losses within the limits stated at lower outputs than would otherwise be possible. The pre sence of the gear introduces an additional loss of from 1½ t 2 per cent. of the power it transmits, or slightly lower wher a second generator is driven.

As the steam pressures are increased the power absorbe by various auxiliaries is affected, and, in turn, the heat con sumption of the plant at economic output. The steam con sumption per kW generated varies as in curve H, fig. 4. Th change in the power taken by the feed pump consequentl varies as in curve L, expressed in similar terms. Electricall driven feed pumps wer assumed, having a norma output corresponding t the steam quantity at th maximum continuous rat ing, and the discharg pressure was taken as 5 lb./sq. in. greater than th steam pressure at the tur bine stop valve. Th pump efficiency varie from 75 per cent. at 250 t 65 per cent. at 2,050 lb./sq in., and the motor effici ency was taken as 90 pe cent. for the normal pum duty throughout. As th pressure increases th amount of dry steam to b condensed decreases rapid ly, as shown in curve J The power taken by th condenser auxiliaries ha been assumed as varying directly with this. Th power taken by the boile stokers and fans decrease with the coal to be burnt and has, therefore, been taken as varying inversely as curve G. With increased steam pressure the net power taken by the con-

700 deg. F., 29-in. vac.

Fig. 6.

denser auxiliaries, stokers and fans decreases as in curve K. Curve G, corrected for the variation in the power of the

xiliaries affected by steam pressure, results in curve M, owing the net gain with increasing steam pressure. Curve gives the variation in thermal efficiency to be expected for installation employing four turbine feed heaters in a generative cycle, and having boilers fitted with economisers d air heaters, and from which Table II has been compiled. The last column gives the series of pressures at the turbine op valve, which correspond approximately to equal increents in the thermal efficiency. Undoubted advantages would sult if the standard pressures adopted were chosen on some ch basis as this, and also from fixing standard flanges to adopted for such pressures. It is regrettable that at present e B.E.S.A. tables do not extend beyond 325 lb./sq. in. Fig. 5 shows curves corresponding to curve G, fig. 3, for other eam conditions. It should be pointed out that the increased in at 28 in. vacuum would be reduced from 2.85 per cent. 2.05 per cent. if regenerative feed heating were adopted in th cases and the effect of auxiliary power taken into account. The variations in the total heat and the heat drop available adiabatic expansion with pressure which would be deduced om the work of some of the major authorities are plotted fig. 6. From the resulting thermal efficiency ratios it will e gathered that the three other authorities would suggest ins resulting from the use of the highest pressures sensibly ss than those arrived at on the basis of Callendar's tables. must be remembered that the data employed for such tables as been obtained from experiments covering a very limited nge, not nearly embracing that covered by current engineerg practice.

Table II.

Increments of Pressure for 3 per cent. Thermal Gain.

Accumulated thermal gain, per cent.	Corresponding increment in pressure, lbs./sq. in.	Change in pressure, lbs./sq. in.	Approximate corresponding pressure, lbs./sq. in.

(*To be continued.*)

Kiosk Sub-Stations.

English Electric Co. kiosk equipment, embodying alternative h.p. control apparatus and totally enclosed l.p. switchgear.

THE advantages of the kiosk type of substation have been fully discussed, and may be summarised briefly as cheapness, convenience, and efficiency, provided always, f course, that the design is sound. Among the firms which

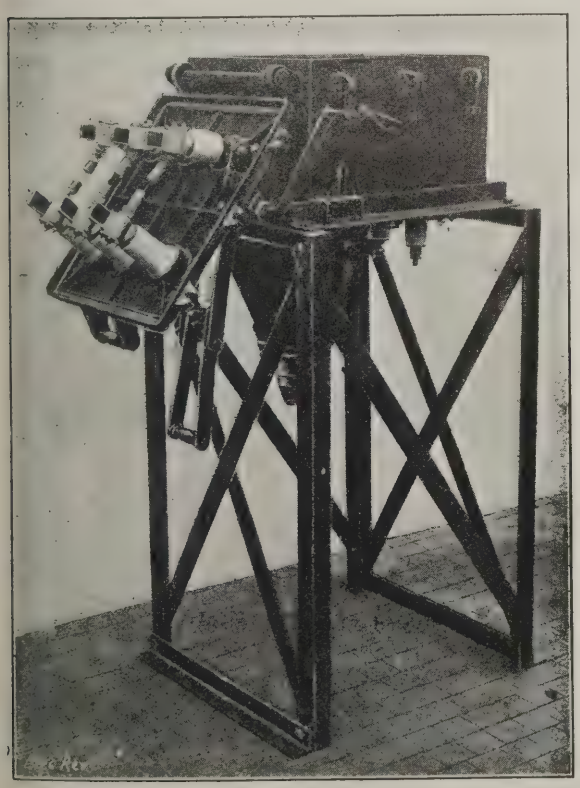

Fig. 1.—Oil-immersed Switch Fuse.

are giving attention to equipment of this description is the English Electric Co., Ltd., and we have received the following particulars of the products in question. Alternative control apparatus may be supplied with the kiosks, and may include on the h.p. side merely isolating switches or fuses, or oil-immersed circuit-breakers may be provided in addition. The fuses employed are of the " Zed " fuse family, and are claimed to have been found extremely successful on comparative tests and in service, no deterioration taking place at ordinary temperatures.

One of the latest productions of the company is the oil-immersed switch fuse, fig. 1, which may also be incorporated in the kiosk equipment in place of the cartridge fuse. The fuse portion, when closed, is immersed in oil contained in a strong

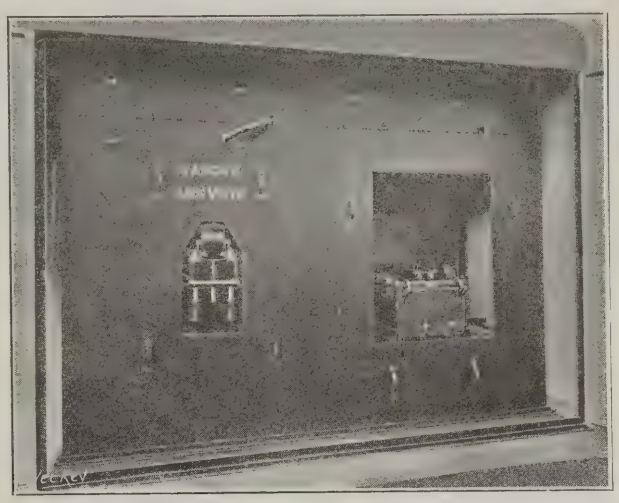

Fig. 2.—H.P. Kiosk Equipment.

welded steel-plate tank, to which is hinged and bolted a cast-steel top. The complete unit is very substantially constructed, and is rated for a rupturing capacity of 50,000 kVA. An interlocking device is incorporated to prevent the fuse being placed in circuit before the lid is properly down. Of course, oil-immersed circuit-breakers give the best protection, but they need only be included where the expense is justified. A particularly effective combination of oil-circuit-breaker and oil switch-fuse can be installed for use on ring-main feeders. The provision of an oil circuit-breaker in each kiosk, together with a suitable arrangement of isolating switches, makes it unnecessary to shut down the ring in the case of a cable fault

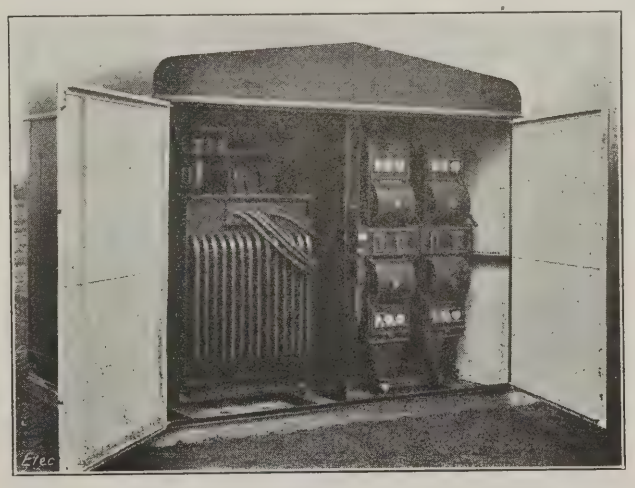

Fig. 3.—Kiosk Substation, L.P. Side.

in one section. A kiosk equipped in this manner and supplied recently for use on a large corporation network is shown in fig. 2. The transformer itself is supplied through an oil-immersed switch-fuse, and the illustration shows the thorough manner in which the h.p. connections are screened, so that no live metal is accessible on opening the kiosk doors. Fig. 3 is a view of the reverse side of this kiosk showing the totally enclosed l.p. switchgear employed, a feature which is strongly recommended by the makers. The transformers employed are of the double-wound, oil-immersed, self-cooled, delta-star type, with the neutral point brought out to a terminal. Tappings are provided in the h.p. windings, which can be connected either to an internal stud board or to a tapping switch. The latter is operated from outside the tank by means of a handwheel. It is standard practice with the English Electric Co. to provide a separate lock and key on the doors giving access to the power transformer, and to screen this chamber so that it is only accessible to an inspector or other person carrying the special key. In the ordinary course the transformer chamber would remain locked even when the doors to the h.p. and l.p. switchgear were open.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

M-L Wireless Generators.

As a result of its application of cobalt steel to the manufacture of magnetos, the M-L Magneto Syndicate, Ltd., has developed a range of machines fitted with permanent field systems, comprising motors, generators, and rotary transformers (*i.e.*, the armature carries two independent windings connected to two separate commutators), which are lighter and more compact than machines having wound field magnets, whilst special attention has been paid to quietness of running, balance of rotating parts, freedom from electrical ripple, and

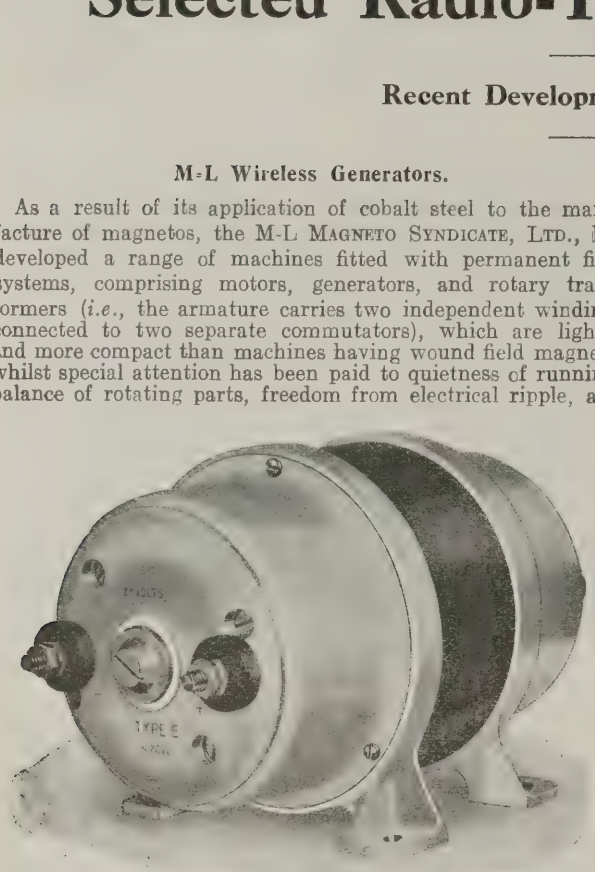

Fig. 1.—A Rotary Transformer.

sparkless commutation. While the machines are suitable for any service for which the orthodox type is normally employed, the employment of a permanent field renders them particularly adapted for certain classes of service. The voltage generated is a linear function of the speed, and the machines are eminently suitable for wireless transmission sets, having the important advantage of possessing better regulation and greater

Fig. 2.—M-L Anode Convertor.

inherent stability than a machine of orthodox type, where fluctuations in load, due to keying or modulation, will cause changes in the field current and strength. When d.c. is available a rotary transformer is preferable to two coupled machines, for charging batteries, for supply of power to small transmitting sets, large amplifiers, and public address systems. The machine is specially designed to reduce the amount of ripple, making the output comparatively easy to "smooth," and when used for reception purposes fine control of output can be obtained by inserting a rheostat in the l.p. circuit. In general laboratory work the machine has many uses, including insulation testing of dielectrics, flash testing of insulation, operation of cathode-ray oscillographs, and the supply of power to valve oscillators of all descriptions. As a generator the machine's output is 100 watts, if wound for a voltage not exceeding 600 V; and 80 watts if wound for between 600 and 1,000 V. As a rotary transformer (fig. 1) it is an excellent source of anode current for low-power transmission work, and is capable of delivering 60 watts up to 100 V, and 50 watts between 600 and 1,000 V. It can be wound for any d.c. input from 12 to 240 volts, and its overall efficiency is 55 per cent. at full load. Ball bearings are fitted, and the brush gear is protected by a cap which can be easily removed for inspection of the commutators. The addition of a motor would make the machine into a double-current generator for energising the anode and filament circuits simultaneously at two voltages.

The standard M-L anode convertor (fig. 2) is also of interest, for it has been designed to replace anode batteries in valve receiving sets and low-power transmitting sets. The machine, which is enclosed with accessories in an aluminium case, is a small permanent-magnet motor-generator, designed to take current from a low-voltage battery (generally the same as that which supplies the filaments) or country house plant, and to deliver current at two voltages simultaneously: a comparatively high one for the l.f. valve anodes and a lower one for the h.f. and detector valves. Provided with an l.p. control rheostat, whereby the convertor can be started and stopped and the output voltage regulated between wide limits, they are also fitted with an l.p. choke and with smoothing circuits on both the h.p. outputs. The convertor's overall dimensions are 17 in. in length and 5 in. in width and height, whilst the largest type weighs but 17.5 lb.

The "R.I." Battery Eliminator.

In order to enable the anodes of the receiver valves to be energised from the domestic a.c. mains and thus eliminate the high-voltage battery, an instrument has been placed on the market by Radio Instruments, Ltd., which comprises a power transformer wound for the voltage of the supply mains to operate a 5-volt double-electrode full-wave rectifying valve and a double-wound power choke having a total inductance of 40 henries for the smoothing circuit; a set of 3-wire wound resistances of 20,000 ohms each, a bank of fixed condensers having a total capacity of 11 μF, and a rheostat for regulating the filament of the valve, are also provided. The consumption of power from the mains is only 5 to 10 watts, whilst two output voltages are provided, one being fixed at approximately 130 V for low-frequency and power valves, while the variable one for the detector and high-frequency valves will give three values of 35, 45, and 65 volts. The set is both neat and compact, the

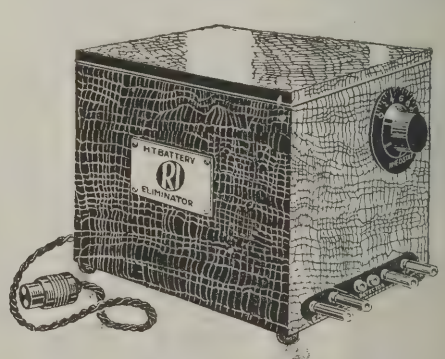

Fig. 3.—The "R.I." Anode Battery Eliminator.

whole of the parts being contained in a substantial metal case, finished to imitate the appearance of leather, as shown in fig. 3; its weight is 14 lb., and dimensions are 8½ in. long, 6⅜ in. wide, and 6¾ in. deep, being made for input pressures of 120 V or 250 V at from 40 to 100 cycles, but those who prefer to build their own eliminator may purchase a complete range of component parts for the purpose. The transformer and choke windings possess a very small d.c. resistance, so that the circuit loss is small; for instance, the resistance of the choke coils is only 190 ohms each: they will carry up to 80 milliamps. Should the domestic supply be d.c., the transformer and rectifying valve are replaced by a resistance, tapped at 2,800, 5,000, 7,000, and 9,000 ohms, suitable for carrying 50 milliamps. In both cases the earth connection of the receiving set should be made through a 1 μF fixed condenser.

The Southern Railway Contract.

Statements by the Various Parties.

WE give below either copies or abstracts of the statements that have been issued by the Southern Railway Company, by Mr. D. N. unlop, the Director of the B.E.A.M.A., by the board the General Electric Co., Ltd., and by others, re-ecting the £120,000 contract for rotary convertors d transformers required by the Railway Company, ich was placed with the Swedish General Electric, d., for its parent concern, Allmanna Svenska ektriska Aktiebolaget.

While we allow these statements to tell the story, we vote a leading article to some of the general con-lerations arising, and in addition we may quote here few impressions gained from Mr. Dunlop. It seems at the Railway Company would have acted with eater fairness to the British manufacturers inter-ted if they had included in their statement an acknow-lgment of the fact that these firms had advanced odifications in their proposals to meet the criticisms the Railway Company. The stipulation of the eneral Electric Co., Ltd., that there should also be aced with them an order for switchgear was regarded an objectionable condition, but it also appears that e Swedish company made it a condition that they ould receive the transformer contract, and the Rail-ay Company have thus penalised the British trans-rmer firms against whom they had no grievance. It understood that the Metropolitan-Vickers Electrical ., Ltd., and Messrs. Mather & Platt, Ltd., were per-ctly willing to undertake the contract, but the atti-de of the Railway Company was opposed to this course ecause they wished to standardise on a machine already stalled. By going out of the country and bringing another machine they have defeated their own end in is particular. There is little reason to doubt that ther the Metropolitan-Vickers Co. or Mather & Platt, td., or Bruce Peebles could have fulfilled the require-ents of the specification, and it is felt that this must ave been known. The statement that it was impos-ble for the Railway Company to avoid "rings" or pooling arrangements" by purchasing on the Con-nent has been traversed, and the Swedish General lectric, Ltd., has made its own declaration that its arent concern does not belong to the Continental ring, nd that its prices are not dictated by such a ring. uestions have been raised regarding the actual connec-ons of the A.S.E.A. with Continental companies, and would be interesting if the precise facts could be ated.

Statement Issued by the Southern Railway Company.

HE following statement appeared in the Press on April 9th:—The Southern Railway Company, as is generally nown, have for some years past been engaged in the ex-ensive electrification of their suburban area. They have already pent about £10,000,000 on this work, and their considered olicy has always been to place their orders for the necessary lant and equipment with British firms wherever possible. n occasion, the maintenance of this policy has been rendered ifficult by the existence between electrical manufacturers of greements which have enabled them to fix and quote iden-ical prices. Nevertheless, in connection with the electrifica-ion of the Eastern section (opened last year) the company laced the contracts for the supply of rotary convertors with hree British firms. On that occasion the plant was ulti-nately purchased, after weeks of negotiation, at prices con-iderably lower than those originally quoted. For the next tage of electrification now being undertaken, the company, n continuance of their policy of purchasing British-made lant, recently invited tenders for the supply of the requisite otary convertors from the same three British firms who had supplied the previous machines. The response to this invitation was an offer by two of the firms jointly to supply only fourteen machines out of the twenty-three required, one of the firms declining to quote without giving any reason. Of these fourteen machines, the supply of seven was made conditional upon the contractor receiving from the company an order for certain other electrical apparatus which had formed the subject of a separate inquiry, and for which, in fact, the company had received a more favourable tender from another firm. The offer of fourteen machines was subsequently increased to the full twenty-three, but only on the added condition that the contracts for the balance of nine machines should be post-dated to November next. This appeared to indicate the existence, not only of a price agreement, but also of some sort of quota arrangement restricting the output of individual firms—or, in effect, dictating to the company the source of supply. In these circumstances the company had no alternative but to find a contractor who was prepared to meet their full requirements on reasonable terms and conditions, and they were reluctantly compelled to turn to Continental manufacturers. As a result, the company have placed a contract with the Allmanna Svenska Elektriska Aktiebolaget of Sweden for the supply of the whole of the rotary convertors. The value of the contract is in the neighbourhood of £120,000. The price required by the Swedish firm is appreciably less than that quoted by the British firms, but the Southern Railway Company wish to emphasise that it is not the lower price which has led them to take this step. They feel that British enterprises should not be penalised by British manufacturers who seek to dictate terms and conditions. The Southern Railway Company have not only their shareholders, but their 70,000 British employés to consider, and in placing, for the first time, an order of this kind out of Britain, they feel that eventually it will not be to the disadvantage of British industry as a whole to draw attention to a state of affairs which causes the loss of wages such an order would ensure.

The B.E.A.M.A. Reply.

Upon the following day Mr. D. N. Dunlop, director of the British Electrical and Allied Manufacturers' Association, made a statement in reply to the railway company's contentions. Dealing with the latter's allegation of the existence of a "ring," Mr. Dunlop said that one of the necessities of modern industrial life was the arrangement of reasonable prices and the distribution of orders. The B.E.A.M.A. was justified in doing this by the enhanced prosperity of the industry; the policy had raised the average dividend paid on the capital of manufacturing firms from 1.67 per cent. to between 5 and 6 per cent., which was not an unreasonable figure. He pointed out that without co-operation in technical matters, in research and design, standardisation, &c., no industry could maintain itself in the face of foreign competition. Reasonable prices had to be obtained if proper wages were to be paid to the skilled workers. In other countries virtually all industries arranged prices and allocated business, and it was doubtful if any important orders for electrical machinery could be placed in any Continental country which would not be given to a member of a "ring." Our Free Trade system protected the home purchaser from being charged unreasonable prices. A railway company should be one of the last concerns to send an order abroad, for it depended to a greater extent than almost any other undertaking on the support of British trade. Mr. Dunlop said:—

"What happened in this case was that the Southern Railway invited tenders for these rotary convertors from three firms—the G.E.C., the English Electric Company, and the British Thomson-Houston Company. These three firms happened to be busy, and they could not carry out the order in exactly the manner which the railway company desired, whereupon, without giving other British firms the chance of taking on the contract, the company petulantly took their business to Sweden. There are at least three other firms in this country—the Metropolitan Vickers, Bruce Peebles, and Mather and Platt—which were not asked to tender, but which would certainly have executed the work within the time and supplied machines which would have filled the specifications of the railway, and that at competitive prices. It is quite untrue that there was any attempt to dictate to the railway company as to terms and conditions. The British firms frankly disclosed the fact that the arrangement existed for distributing business on an equitable basis among the manufacturers, and apparently this was objected to by the railway. Certainly, no attempt was made to charge excessive rates, for our prices are based as a rule on those which firms would quote in open competition. In the case of this contract the price quoted to the Southern was distinctly a 'cut' price."

He considered that the fact that the order had been placed abroad would do British manufacturers a great deal of harm in the foreign markets. He could not understand why the company should be irritated because the manufacturers combined and distributed business: combination had been the salvation of the railway companies, so far as they had been saved. He concluded:—"We know that they used their powers to dry up canals and generally snuff out all forms of competition of that sort. They now have to meet very keen competition in the way of road transport, and it may be that electrification will prove of enormous benefit to them in the struggle. Of course, we have no desire to irritate purchasers, and we shall certainly take this lesson to heart and try to make the application of our principles more attractive."

Statement by the G.E.C.

Subsequently, the General Electric Co., Ltd., expressed its views in a public statement in the following terms:—

The Southern Railway have sent a communication to the Press with the object of justifying their decision to place an important contract with a Continental firm. The reader will no doubt be impressed that the railway company have made out a good case; there is, however, another side to the question. The company, quite unmindful of the monopoly which they enjoy in an important part of the country, seem to resent the fact that electrical manufacturers have taken steps to protect their industry to some extent. For years the industry has lost hundreds of thousands of pounds through unrestricted competition and through the principle prevailing here of placing contracts with the lowest bidder, while demanding guarantees of the highest performance. Research and development have been carried out at great expense by dozens of firms. The industry did not develop on a normal progressive curve, but alternately by periods of rush and periods of stagnation. During the former, unjustifiable extensions of works occurred; during the latter, all were suffering. Wages had to be squeezed under such conditions, and periods of unemployment occurred all too frequently in different parts of the country. The conditions of the war forced us to collaborate for the good of the country, and some of the principles of co-ordination which were introduced then, still exist. They have proved for the good of the industry; they have helped to improve the conditions of labour; and they have not been unfair to the consumer. They have yielded a most modest return to the investor, they have enabled us to spread the work more equally amongst the factories existing and, above all, they have enabled us to build up a quality which puts British electrical products foremost in the markets of the world. Why the Southern Railway should be of opinion that it is wrong for the electrical industry to protect itself, more than it is wrong for a railway company, trade union, the Law Society, the Stock Exchange, or any other trade or profession to do so, we fail to understand. The contract is an unusually large one from one purchaser. The company itself is likely to place only one such contract in five or ten years. Realising the capacity of output of the whole industry, it seems to the common good that such a big contract should be divided amongst a few of us so as not to interfere with the regular service to regular clients. This is all we attempted in the first instance; there was no attempt at dictation. When the Southern Railway objected to place the contract with three firms, the General Electric Co., Ltd. (who, at the present moment, fortunately have a good order book) were anxious to accept 50 per cent. of the contract. We have previously supplied such machines to the Southern Railway, which have given satisfaction. Why the Southern have not accepted our offer, we do not know. The fact that we desired, at the same time, to obtain the contract for the switchgear required for the rotaries, was a mere expediency to balance our respective shops with the most suitable class of work. We withdrew that condition when the Southern were unwilling to grant us this favour; equally so, the condition dating the contract at the later period, was withdrawn. It was therefore open to the Southern to place one half of the contract with the General Electric Co., Ltd., who had given them satisfaction, and the other half with quite a number of British firms of first-class standing, who were anxious to secure the work. The fact that the Southern had no experience with some of them, surely applies also to the Swedish company to whom they preferred to give the order. The fact that a Swedish firm can make at a cheaper price than English firms, is easily accounted for, and needs no elaboration from us. We regret the loss of this contract to this company and to the country as a whole more than we can express. We trust this statement makes it clear that if there was any attempt at dictation, that attempt did not emanate from the side of the manufacturers.

A Non-B.E.A.M.A. View.

The *Manchester Guardian* quotes the opinion of a firm of electrical manufacturers which is not a member of the B.E.A.M.A. The view is taken that competition is far from eliminated by the Association's agreements, for there was very considerable competition between B.E.A.M.A. concerns and independent British companies, quite apart from competition with foreign concerns, such as the Swedish company to which the Southern Railway contract had been given. "Non-ring" firms were often able to quote more attractive terms on a better article, especially in the case of smaller machines or accessories. Of course, only the larger companies in the B.E.A.M.A. were able to produce exceptionally high-powered machinery, but there were only a few orders for such machines. Our contemporary's informant said that the B.E.A.M.A. fixed their prices by means of a "horse-power curve" which each firm adhered. This curve showed the rel between horse-power and price, so that in submitting a te for a machine of, say, 200 h.p., a manufacturer would to this particular point on the curve, which would show the agreed price to quote. He believed, however, that ac ence to the "horse-power curve" was not absolutely r and that in bidding for an order against a firm outside "ring" or against a foreign firm, members of the "ri frequently quoted "cut" prices to secure the contract.

Other Views.

A letter signed "Engineer" appeared in *The Times* of A 23rd. In this the writer says that the efforts of buyers to a "rings" by placing orders on the Continent would be ar ing if they were not so sad, for there the system of rings is more intense than in this country. "The judgment on c binations, rings, cartels, &c., should be based not on some s mental idea but the sound basis of the ultimate cost of pro ing and selling." An instance is quoted where combina would have actually reduced the price of a certain article, w giving a higher profit. With regard to the allocation of w "Engineer" says:—"Every manufacturer knows the ben obtained in the cost of production when the volume of w is kept at a steady level. A crowded workshop, entailing n shift and overtime, is uneconomical and unsatisfactory to workmen, and if there is a sudden drop in the volume of w necessitating the discharge of a number of workmen, the p tion becomes even less satisfactory. The general public been taught by the discussions on the Electricity Bill the v of a steady load, and the buyers of electrical plant should the last people to grumble at an endeavour to smooth out peaks of the load in the workshops by some method of s cating work. Practically everything one buys has a ring pr Our daily bread, and many of the other necessaries of life, c under this category, but we do not grumble so long as we kn that the price is a reasonable one. We recognise that unlim competition would be inadvisable and likely to increase rat than diminish the selling price. The manufacturer of e trical apparatus has to buy most of the material that con tutes the product at ring prices, and the Government municipalities insist, very properly, that labour is not to paid at less than standard agreed rates, and the employer no desire to lessen costs by forcing down wages which alre compare unfavourably with the wages paid in the shelte trades. If balance-sheets of the firms in a ring showed un profits one would think it necessary to call for some pu inquiry, but the dismal results shown by most of the engin ing firms hardly warrant a complaint of this nature."

Mr. Henry Edmunds, who had so much to do with initiation of the Cable-Makers' Association, writes to *Times* stating that the objects of that body were broad-min in nature, combining the protection of the industry fr price-cutting, improved labour conditions, standardisation quality of materials and workmanship, assuring to the c tomer stabilised prices and satisfactory product. The exp ment has, he says, been amply justified, and it is only natu that other branches of the industry should have followed "lead." Writing as a "spectator of the game," he a his regret that "a large order should have gone abroad account of a false feeling of pique occasioned by the appe ance of 'dictation' on the part of certain electrical firms w were carrying out an honourable understanding in the intere of the industry as a whole."

Another correspondent, an anonymous "Electrical En neer," thinks that the controversy will do nothing but g if it helps the public to realise the extent to which the nati is exploited by combinations of business concerns "and h much the advance of electricity in this country is hampe by these rings, which control . . . almost every other bran of the electrical industry." He proceeds to refer to the ope tions of the cable-makers, the accumulator makers, and t lamp manufacturers, and the arrangements existing betwe the last-named and the retailers. He concludes: "The sta ment that competition would be likely to increase pri rather than diminish them is astonishing. But why not gi competition a trial again?"

The Swedish Company's Denial.

Dealing with the implication that the Allmanna Svens Elektriska Aktiebolaget is in a Continental "ring," Mr. S. Busch, the managing director of the company's subsidiary, t Swedish General Electric, Ltd., says that his company and t parent concern are an entirely independent organisation and not belong to the Continental "ring." "The statemer therefore, that the Southern Railway have placed their ord with a firm whose prices are dictated by a Continental ri organisation, is completely without foundation."

Colour Photo-telegraphy.

The American Telephone and Telegraph Co. announces th pictures of three or more colours can now be transmitted b wireless across the Continent, and reproduced with delica shadings. Engineers have been experimenting for a year c coloured telephotos on the same principle as black-and-whi photos. Separate transmission is necessary for each colour.

The Venner Time-Switch Anniversary.

ON Friday last, at the Trocadero Restaurant, London, the directors of Venner Time Switches, Ltd., celebrated the 21st anniversary of the foundation of the company a dinner, to which many of their friends, representative of various branches of the electrical industry, were invited. A memorative brochure by Mr. W. L. Randell, of which ies were handed to the guests, told the story of the origin the firm, of which the late Robert F. S. Venner—an old adian, and one-time member of the staff of the Grosvenor lery works—was the head. The need for reliable time-tches made itself felt some 25 years ago, in connection h the two-rate system of charging for electricity; a solution he problem was furnished by Mr. R. C. Graseby, who has r since remained in charge of the technical work and has eloped 30 standard types of time-switches, in addition to cial types for special purposes, averaging one a week all year round. No mechanical problem comes amiss to him, his switches can do anything but talk. Mr. E. E. Sharp, co-director, deals with the commercial side of the business, has travelled in almost every country, invariably opening new fields and extending the company's circle of friends.

he policy of the company from the first has been to place lity before price; experience has shown that a time-switch, be of use, must be reliable and trustworthy above all gs, and no variation from that ideal has been permitted. de the works no less attention is given to securing the fort and satisfaction of the employés, with whom a close cordial relationship is maintained, and who are made feel—by practical participation in the profits—that they e a stake in the business.

t the dinner Mr. R. C. Graseby (managing director) pre-d, and, after the toast of "The King" had duly been oured, Mr. J. W. BEAUCHAMP (director, E.D.A.) proposed he Firm." He said the firm had applied modern commercial methods and modern scientific methods to what was, aps, the oldest mechanical contrivance in the world—clock—and they had done it with very great success. He w that the association between Mr. Graseby and Mr. dwell (the foreman) and the staff was a very happy one, he felt that they had managed to recapture the old Guild ng which was reflected in the very excellent quality of work turned out by the firm. Mr. Sharp was famous ughout the industry for his contact method of salesman-, and he particularly wished to thank him for the very lfish, far-sighted and whole-hearted sort of E.D.A. work ch he had been doing for a long time.

r. P. A. MAYDWELL, responding on behalf of the employés enner Time Switches, Ltd., said they had many privileges: e was a generous bonus system; they were paid for eek's holiday every year, and for all Bank Holidays, and e was an annual outing entirely at the expense of the . In case of sickness the men were paid up to two weeks ne year. The staff all felt that the firm's interests were r interests and *vice-versa*.

r. R. C. GRASEBY, who followed, said the firm started in nall way, but to-day it was making a range of time-ches from 1 ampere to 1,000 amperes and a voltage range 6 to 6,600 volts, having operating times ranging from 24 s to every few seconds. This apparatus had to be made od as it possibly could be. Quality had been the aim all time. The firm had not been satisfied with going out the home trade; it had gone out into the whole world markets, and had been able to meet competition com-bly and easily. The results of Mr. Sharp's visits over-were always very beneficial, not only to the firm but, he ved, also to the industry as a whole.

r. E. E. SHARP proposed "The Electrical Industry," re-ing that such a gathering meant that good craftsmanship generous dealing were still appreciated by those whose ions were worth having. Referring to the British Indus-Fair, he said it seemed to him an extraordinary thing old such an important Fair in February; they could not ct people who lived in sunny climates to come here at a period of the year. If they held the Fair in May or they would be so inundated with visitors that London d be the only place to hold it, because of the hotel accom-ation. They were gathering their forces together for one of greatest advances ever experienced; they could all be happy the working of the Electricity Act of 1926 had been placed ch thoroughly competent hands.

W. W. LACKIE, C.B.E. (an Electricity Commissioner), nding to the toast, said that the representatives of the rical industry present heartily congratulated the company. hoped that its prosperity would be maintained during the 21 years. They were a law-abiding nation, and he felt that, now the 1926 Act was on the Statute Book, they d all do everything in their power to help the work of Central Electricity Board, so that the electricity supply of country might be the success they all wished it to be.

J. R. BROOKE, C. B. (Secretary, Central Electricity Board), replying to the toast, congratulated the firm upon attain-s majority. The Board hoped in a very short time to win ght to recognition as part of the electrical industry of this try, by having rendered to it really valuable service.

Published Specifications.

Compiled expressly for this journal by a firm of Chartered Patent Agents. The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

Trade Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from the dates given. In the case of foreign applications the names and addresses of the British representatives are also given:—

April 13th.

Electrolux. No. 476,992. Class 6. Machinery of all kinds. No. 469,786. Class 18. Refrigerators and cold storage chambers.—Electrolux, Ltd.

April 20th.

Hydra (lettering and design). No. 472,069. Class 8. Electrical condensers, &c.—Gesellschaft Hydrawerke, 18, Windscheidstrasse, Charlottenberg, Berlin. (Boult, Wade & Tennant, 112, Hatton Garden, E.C.1.)

Lebrenco. No. 472,379. All goods in Class 8.—W. H. Le Breton, trading as the Le Breton Engineering Co., Windsor House, Victoria Street, S.W.1.

Tonisator. No. 475,860. Class 11. Electric apparatus for surgical and curative purposes.—Adolf Halpern, 10, Hegergasse, Vienna. (Haseltine, Lake and Co., 28, Southampton Buildings, W.C.2.).

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

ALEXANDRIA (Dumbarton).—Artificial silk factory for the Scottish Artificial Silks, Ltd., Edinburgh.
ALSTON.—School, for Cumberland E.C.; director of education, Carlisle.
AUSTRALIA (Sydney).—Refuse destructor for the Municipal Council. Specifications from J. Davis, consulting engineer, 100, Victoria Street, London, S.W.1.
BARNSLEY.—Three new elementary schools; Education Committee.
BEDLINGTONSHIRE (Northumberland).—50 houses, Cambois Estate; U.D.C. surveyor.
BOURNEMOUTH.—Extensions, highways depôt, for Corporation; F. W. Burton. Business premises and flats, Exeter Road; Rebbeck Bros. Shops and houses, Wimbourne Road; F. Moorman.
BRADFORD.—Extensions to artificial silk factory for Brysilka, Ltd., Apperly Bridge.
BRAYFORD (Barnstaple).—Wesleyan church and schools; Mr. Copp, architect, Strawberry Cottage, Bideford.
BRIGHTON.—Memorial hall (£6,500); Rev. Canon F. C. N. Hicks, vicar.
BRIGHTON.—Additions to Dorset Garden Wesleyan Church (£14,000); trustees.
BURNHAM-ON-SEA.—Water supply scheme, with electrically-driven plant, Brent Knoll station, for the U.D.C.; Willcox & Raikes, consulting engineers.
CHAWLEY (Oxford).—Saw mills and engine house, for the Chawley Timber & Brick Co.; Mr. Reynolds, manager.
CHESTER-LE-STREET (Co. Durham).—Additional 42 houses, for the R.D.C.; estates surveyor.
COATBRIDGE.—Tearooms (£2,000) for A. B. Brown, Ltd., bakers; the manager.
CONISBOROUGH (Yorks).—Colliery engine house, Cadeby Colliery (several thousand pounds); Mr. Young, manager.
CROYDON.—Wesleyan schools (£8,000), with electric lighting; Alder & Turrill, architects; Truett & Steel, Ltd., builders.
DAGENHAM.—8th and 9th elementary schools; Essex Education Committee.
DERBY.—Housing scheme (88), Derby Lane site, for the T.C.; C. A. Clews, borough surveyor, Babington Lane. Boys' secondary school. Elm Tree House estate, for the borough E.C.; Macpherson & Richardson, architects, Tenant Street.
DORCHESTER.—Grammar school, Manor Road; governors.
DURHAM.—Houses (£59,078), for the T.C.; Mr. Elcoat, builder.
EASTLEIGH.—Schools, for Hants E.C.; director of education, Winchester.
EDINBURGH.—Super-cinema to seat 3,000; F. A. Lumley, proprietor.
ELLESMERE PORT.—Schools (800 places), for the Cheshire E.C.; F. A. Browne, county architect, Newgate Street, Chester.
FIFESHIRE.—Church at Rosyth (£6,200); Rev. William Stephen, Inverkeithing.
GLASGOW.—Shopping centre, High Carntyne estate; housing director.
GLOUCESTER.—Re-erection of printing works, Bell Lane, for the Crypt House Press, Ltd., and the Gloucestershire Chronicle, Ltd. (between £25,000 and £30,000).
HAMILTON.—Fire station; the burgh firemaster.
HEMEL HEMPSTEAD.—Additional housing scheme (48) for the T.C.; borough surveyor.
HORNCHURCH (Essex).—Houses (38). Rainham Road, for T. England.
HORNSEA.—Extensions, municipal buildings; U.D.C. surveyor.
HULL.—Electric lighting, Park Avenue School; education director. Re-erection of portion of oil cake mills, electrically equipped, Maxwell Street, Stoneferry, for Spencer, Isaac & Co. (several thousand pounds).
IRISH FREE STATE (Dundalk, Co. Louth).—54 houses for the U.D.C.; M. Sellars, Council surveyor.
(Thurles, Co. Tipperary).—Technical school for the North Riding Tipperary Joint Technical Committee; V. Kelly, architect, 4, Grafton Street, Dublin.
KIRKCALDY.—286 houses for District Committee (£120,000); county clerk.
LEICESTER.—Church hall (£7,000), Saffron Lane Estate, the Wesleyan trustees; secretary.
LONDON (Barking, E.).—Chemical store, Abbey Ro Chemical Supply Co., Ltd. Infectious diseases hospi for the U.D.C.; H. Hargreaves, clerk.
(Ilford, E.).—High school for girls; Essex Education Co mittee. Shops, Beehive Lane and Eastern Aven P. E. Brand, Ltd.
(West Ham, E.).—School, South Hallsville (£16,000), w electrical and heating work, for the borough E.C.; e cation architect.
(Greenwich, S.E.).—Welfare centre, with electrical a heating work (£3,700), for the T.C.; borough survey
(Sydenham, S.E.).—Additions, Technical Institute, Syd ham Hill Road; W. J. Dixon & Sons.
(Westminster, S.W.).—Buildings, Vandon Street; T. Mawson & Sons.
MACCLESFIELD.—Block of offices, for the Cheshire Bui ing Society; F. C. Sheldon, architect, 7a, King Edw Street, Mineral water works, Great King Street, G. Ray & Sons, Ltd.
MANCHESTER.—Bus garage extension, Queen's Road; c architect.
MIDLOTHIAN.—Extensions at West Calder Roman Cath school (£4,800), and extensions at West Calder High a Bonnyrigg schools; clerk, School Management Comm tee, West Calder.
MITCHAM.—Wireless transmitting station, for the Ministry.
NELSON.—Secondary school; S. Wilkinson, country arc tect, 16, Ribblesdale Place, Preston.
NEWARK-ON-TRENT.—Extensions to Kelham Hall (£75,0 for the Society of the Sacred Mission; Moss & S builders, Loughborough.
NORTHAMPTON.—Schools, Far Cotton (£16,513), for t Borough E.C.; director of education.
OLD HILL (Staffs.).—Re-erection of brush factory, for Hec Bird.
PRESTWICH (Ayrshire).—Housing scheme (76), for t T.C.; burgh surveyor.
RICHMOND (Surrey).—Central schools (£35,000), for t borough E.C.; the clerk.
SALISBURY.—Administration block extensions, for the Jo Isolation Hospital Committee; T. Walker, county arc tect, Trowbridge.
SANDBACH (Cheshire).—Cinema, for Beech & Smith; J. Price, architect.
SOUTH AFRICA (Cape Town).—Housing schemes (£160,00 city engineer. Market extensions (£58,000) for Corpo tion; J. Rubbi.
SOUTHEND - ON - SEA. — Knitting factory, electrica equipped, The Mall, Southchurch, for Parsons Bro Whitelands.
STAFFORD.—Extensions to market hall (£7,500), for t T.C.; borough engineer.
STOCKPORT.—Operating theatre, for the infirmary gov nors; Worthington & Sons, architects.
SUTTON.—34 houses, Ridge Road; U.D.C. surveyor.
SWADLINCOTE.—Housing scheme (60), Gresley, for t U.D.C.; surveyor.
SWANSEA.—Hall and shops, Portland Street and Park Stre A. Ruck. 43 houses, Grenfell Park estate; Jones Br
THORNABY-ON-TEES.—Houses (69), for the T.C.; Steph Coates, Ltd., builders, Middlesbrough.
TREDEGAR.—Additional 100 houses, Ashvale, for the U.D.C surveyor.
WARWICK.—100 houses; borough engineer.
WEST CALDER.—Extensions to schools (£4,800), for M lothian E.C.; director of education, Edinburgh.
WEST SUSSEX.—Three ultra-violet ray stations; W Sussex Education Committee and the British Red Cr Society.
WICKERSLEY.—School, Sunnyside, for West Riding E.C education architect, County Hall, Wakefield.
WIGAN.—Town hall extensions (£12,084), for the T.C.; R. Donald, borough engineer. Church, Newtown (£8,00 for the Wesleyan trustees; Rev. Francis G. Gray.
WILLINGTON (Co. Durham).—Additional housing sche (30), for the U.D.C.; surveyor.
WOMBWELL (Yorks).—Housing scheme (66), King's Ro for the U.D.C.; D. H. Roberts, architect, Park Stre
WORKSOP.—Joint municipal offices, U.D.C., R.D.C., a Board of Guardians.

The

Electrical Review

VOL. C. MAY 6, 1927. No. 2,580.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Increasing Steam Pressure.

ENGINEERING practice never stands still for long. We have been privileged to watch the reciprocating engine for driving electric generators developed from small beginnings to its limits on two main lines—high speed and low speed—and to see it superseded by the steam turbine, while the Lancashire boiler has given place to the water-tube type, and parallel changes have taken place in all other branches of power-station design; but finality is apparently remote. At present the field of most active evolution is the boiler house, where the methods of combustion and the conditions of steam generation are in course of profound modification. As usual, the merits of the new departures are being keenly debated; the use of pulverised fuel on the one hand, and the adoption of higher steam pressures on the other, are questions of the first interest to the station engineer, who has to consider not merely economy, but also other factors of equal or even greater importance, such as reliability and maintenance.

With regard to the tendency towards increased steam pressures, no great departures from customary practice have been made in this country, though Mr. Thos. Roles is carrying out an interesting scheme at Bradford, involving the superposition of an 1,100-lb. boiler and turbine on plant operating at ordinary pressures. In the course of a long and interesting report presented to the Electricity Committee of Bradford Corporation by Mr. Roles, dealing with his experiences during his visit to the United States and Canada last year, he remarks that when visiting the Hudson Avenue power station of the Brooklyn Company, which is to be one of the largest in the world, he found that the steam pressure was only 265 lb. per sq. inch, the total tempera-

ture of the steam was 611 deg. F., and retort stokers were in use. At the Hell Gate station of the New York Edison Company similar conditions were met with, and on inquiry he learnt that this conservative policy had been adopted in order to make these stations as far as possible secure from breakdown, owing to the rapid increase of the load in New York and the supreme importance of reliability. It will be borne in mind, too, that the electricity supply of New York and Brooklyn is provided by stations situated close to the load, in preference to transmission from a distance, for the sake of the greater degree of reliability thus obtained. On the other hand, Mr. Roles visited the Edgar station at Boston, where a boiler has worked for 12 months at 1,200 lb. per sq. inch, and the Lakeside power station of the Milwaukee Electric Railway and Light Company, where plant to work at 1,400 lb. per sq. inch is being installed, with pulverised-fuel firing; and elsewhere he met with boiler pressures of 550 and 650 lb. per sq. inch, with which no difficulties had been experienced. Again, at the new East River station, New York, the steam pressure is to be 375 lb. per sq. inch and the temperature 700 deg. F., with pulverised-fuel firing.

With regard to turbo-generators, Mr. Roles considers that the machines made in this country compare favourably with those in use in the United States, and attain a higher efficiency than the latter; but his general conclusion in respect of boiler plant is that American practice is decidedly ahead of that which has hitherto obtained on this side of the Atlantic as regards the size of boilers, the working pressures, the construction of furnaces, and the methods of firing and control of combustion. Experiments have been carried out with steam generated at 3,200 lb. per sq. in. and 706 deg. F.—a "critical point"—at Rugby, of which we published particulars four years ago; the North Tees power station uses a pressure of 475 lb. per sq. in., at 700 deg. F., and pressures of 600 and 800 lb. per sq. in. have been used at Amsterdam and Langerbrugge, whilst experimental work has been done on the Continent at pressures up to 1,500 lb. per sq. in.

Obviously steam generation practice is in a state of flux, with a decided tendency towards the use of pressures considerably above those usually adopted hitherto. For this reason the paper read by Mr. H. L. Guy (chief engineer, mechanical department, of the Metropolitan-Vickers Electrical Co., Ltd.) before the Institution of Mechanical Engineers, in which the author provided means for determining the economic value of increased steam pressure under any given conditions, deserves the careful attention of all engineers who are interested in power production. A full abstract of the paper is concluded in this issue, from which it will be seen that the author does not advocate either high or low pressures as a general proposition; he gives data and curves which will enable any engineer, on substituting the data corresponding to the conditions which obtain in his own case, to judge for himself the most suitable pressure and temperature to employ, so far as economy is concerned. Whilst load factors of 60 and 100 per cent. are unfortunately rare exceptions in this country to-day (though not altogether unknown), the time is approaching, we hope, when many stations carrying "base load" will work with high load factors, and no new plant in "super"-power stations should be installed without having regard to that possibility. Very high load factors *must* be obtained if electricity is to be as cheap as it should be, and if the Central Electricity Board's schemes are to be successful.

Saving the D.O.T.

Some of the comments that have appeared in the Press regarding the future of the Department of Overseas Trade are so conspicuous for their want of knowledge that they call for a good deal of patience to read, and more to reply to them. From those who have reason to know from practical experience the usefulness of the organisation to all who take the trouble to avail themselves of its various services, there has been a general chorus of disapproval at the Government's intentions so far as they can be understood from the statements of the Chancellor of the Exchequer and the President of the Board of Trade. The Prime Minister has been asked to receive a deputation from the Association of British Chambers of Commerce, which has passed a strong resolution urging that the efficiency of the present Department should not be impaired. The suggestion that we may revert to the dual system by which the Foreign Office and the Board of Trade will both deal with questions affecting assistance to trade is viewed with dismay, as it well may be, remembering pre-war controversies. It has been suggested that those who approve of the termination of the Department include merchants who are interested in the sale of goods of foreign manufacture, but that British manufacturers and others concerned mainly with the sale of British products and therefore with the maintenance of British employment and the reduction of unemployment pay desire its good work to be efficiently continued. To suggest that the Department is not necessary, because it is only used by a small proportion of the nation, and that those who use it should bear the cost of it—is to express an absurdly short-sighted view. Shall we abandon all our Trade Commissioners because some traders ignore them? The criticisms of the Government proposals and speeches may be expected to be reflected in the reconsidered intentions when they are announced, but it is becoming increasingly obvious that as a measure of economy the scheme looks more like a piece of window-dressing than anything else, or, to speak more plainly, sheer nonsense. What folly to talk of abolishing a business-getting department at a time when one of the most vital concerns of the nation is to get business!

The Federation of British Industries has passed a series of resolutions offering its co-operation and help in securing economy in this matter with the least possible injury to national interests. It has offered to lay its views before the Government, as well as the experience that it has had of the problems involved in connection with an overseas organisation. We do not believe, however, that the trading community will desire the functions covered by the Department of Overseas Trade to be handled by any body which does not place its facilities at the disposal of all British manufacturers, whether organised or not.

The Institute of Fuel.

The Councils of the Institution of Fuel Economy Engineers and the Institution of Fuel Technology are to be congratulated on their decision to adopt the suggestion of Sir Alfred Mond, president of both bodies, that they should combine their forces and form one authoritative and influential Institute. As we have urged in these columns, the continued existence of two institutions with practically identical aims would have led to rivalry and dissipation of effort, and certainly it had already alienated the sympathies of many would-be members, thus weakening them both; the subject with which they deal is of vital importance to this country, and it is most desirable that its investigation shall be conducted with the maximum of efficiency and concentration.

There is now every reason to believe that a career of valuable service both to the nation and to the members lies before the Institute of Fuel, which will be able to speak and act as the sole organisation fully representative of the wide and varied interests concerned in the production and use of fuel.

Electrical Development in South Wales.

The Upper Boat Generating Station of the South Wales Electrical Power Distribution Co. has been extended so as to provide for an ultimate capacity of 100,000 kW. The recently installed plant includes a 16,000-kW turbo-alternator and eight 60,000-lb. boilers.

THE official inauguration on April 26th, by the Rt. Hon. the Earl of Plymouth, of the new extensions to the Upper Boat generating station of the South Wales Electrical Power Distribution Co., marked an important stage in the development of electricity supply in South Wales.

Fig. 1.—General View of Power Station.

The power station, fig. 1, is situated on the banks of the River Taff, and is about 10 miles distance from Cardiff and two miles south from Treforest. The company obtained its supply powers in 1900 by one of the earliest electricity Acts, and building was commenced in April, 1902, the first supply being given in early 1904. The area covered is the county of Glamorgan and as much of Monmouth as lies west of the River Usk, there being certain restrictions with regard to some of the urban districts and county boroughs. The original generating plant at Upper Boat consisted of 14 Niclausse boilers supplying steam at 200 lb. per sq. in. to three Willans-Ganz sets, 1,500 kW, 11,000 V. There were other smaller power stations on the system which were eventually shut down, thus concentrating the generating plant at the station under review. The reciprocating engines were run until 1908, when a 3,000-kW Westinghouse turbo-alternator was installed, followed in 1911 by a Willans-Dick Kerr 3,000-kW set, and in 1914 by a 5,000-kW set by the same makers. The steady growth of the demand resulted in 1920 in the placing of an order with Messrs. C. H. Parsons & Co. for an 18,750-kW turbo-alternator, a wise provision being made in specifying that this machine should be designed for a steam pressure of 350 lb. per sq. in. Even before this set was working it was found that additional plant would be required, and fresh capital was raised.

In 1923 Mr. J. S. Highfield was appointed consulting engineer to the company, and he prepared a scheme which led to the extensions which are the subject of this article. Fig. 2 illustrates the lay-out of both the old and new portions of the station.

The new boiler house accommodates eight 60,000-lb. water-tube boilers. These were supplied by Messrs. Babcock & Wilcox, Ltd., four being fitted with superheaters and air-heaters only, and four with small economisers in addition. All the boilers are equipped with chain-grate stokers driven through epicyclic gearing giving eight alternative speeds. They are arranged four on either side of a well-lit firing space along which runs a railway track to serve in the event of a failure of the coal-handling plant. Coal is brought by rail from the Maes Mawr sidings of the Great Western Railway, the wagons being hauled to the power-station yard by steam locomotives.

A well-fitted control room is situated in the boiler house. The efficiency of the boilers is 83 per cent. at full load, assuming the feed-water temperature to be 200 deg. F., and the heating value of the coal to be 12,500 B.th.u. per lb.

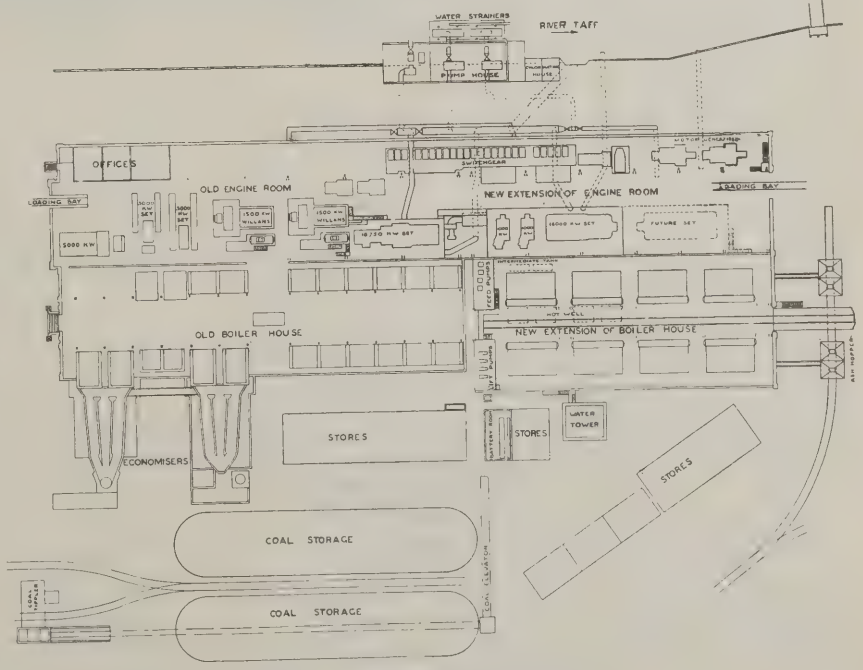

Fig. 2.—Lay-out of Upper Boat Plant.

Under the boiler house are situated two underfeed ash conveyors, each driven by a 9-h.p. motor. These remove the ash by a scraper chain from a water trough

to a 30-ton bunker outside the boiler house. Four turbo feed pumps serve the boilers, two 15,000-gal. per hour, 5,500 r.p.m., and two 27,000 gal., 4,500 r.p.m. For lifting the water from the basement hot-well tanks to those on the overhead, or fan-level floor, four reciprocating pumps are used, each having an output of 15,000 gal. per hour. The make-up water is usually taken from the river, treated and pumped into these tanks. From the head tanks the water falls to the boiler feed pumps. The induced- and forced-draught fans are housed on a floor above the boiler room, where two Weir live-steam evaporators, each capable of dealing with 3,000 lb. per hour, are installed.

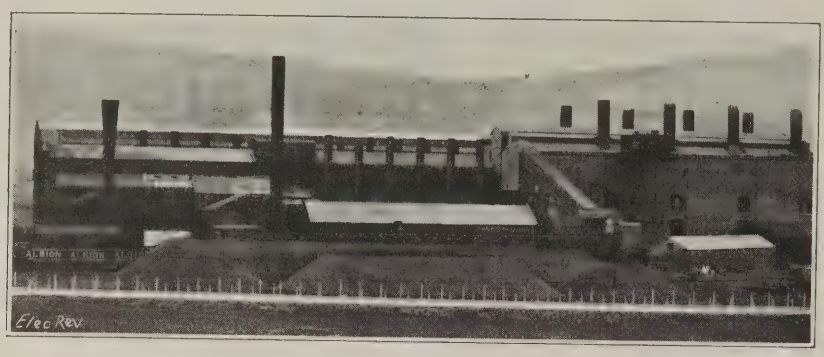

Fig. 3.—Upper Boat Station, Showing Coal-Handling Plant.

The coal-handling equipment, fig. 3, consists of a continuous-band conveyor, by Messrs. Fraser and Chalmers, which throws the coal off automatically at points where it is picked up by a travelling grab and redistributed. Successive belts take the coal into the boiler-house bunkers, each of which has a capacity of 300 tons.

The new portion of the turbine room is of modern design and well lighted, and is at present equipped with a 14,000-kW turbo-alternator, fig. 4, supplied by the English Electric Co., Ltd., 1,500 r.p.m., 11,500 V, three-phase, 25 cycles. The stop-valve steam conditions are 325 lb. per sq. in. and 725 deg. F. It is interesting to note that tenders are being invited for another turbo-alternator of 25,000-kW capacity. The turbine exhausts into a 2-flow surface condenser equipped with air pumps of the ejector type and centrifugal extraction pumps.

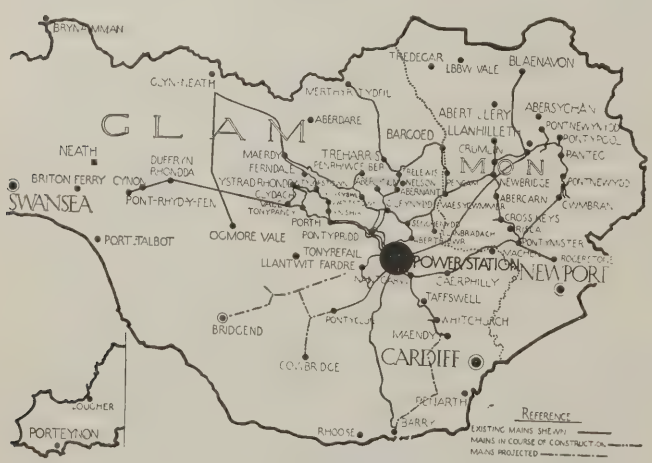

Fig. 5.—S. Wales Distribution Lines.

The new extensions also include two 600/1,000-kW turbo-alternators, supplied by Messrs. W. H. Allen, Sons & Co., Ltd., for supplying power for the station auxiliaries. The alternators are driven by the turbines through 10-1 reduction gearing. Each machine generates at 440 V. The turbines are fitted with jet condensers and the cooling water is taken from the condensate from the main turbines. This arrangement serves efficiently for heating the boiler feed water. The temperature of the water can be varied by changing the load on the machines, which is effected by transferring the station motors to or from the l.p. generators and the house transformers.

The cabling work in connection with these machines has been carried out by the South Wales Power Co.'s own staff, as also has the general wiring and switchgear cabling.

For giving a 50-cycle supply to the Great Western Railway Docks at Barry, two 2,000-kW motor-generators are installed in the works basement, where there are also two 3-phase, 4,330-kVA booster transformers arranged to give boost voltages of 250, 500, 750, or 1,000. This arrangement is necessary, as the line which is supplied by the transformers is some 20 miles in length and, at the moment, is working at only 11,000 V.

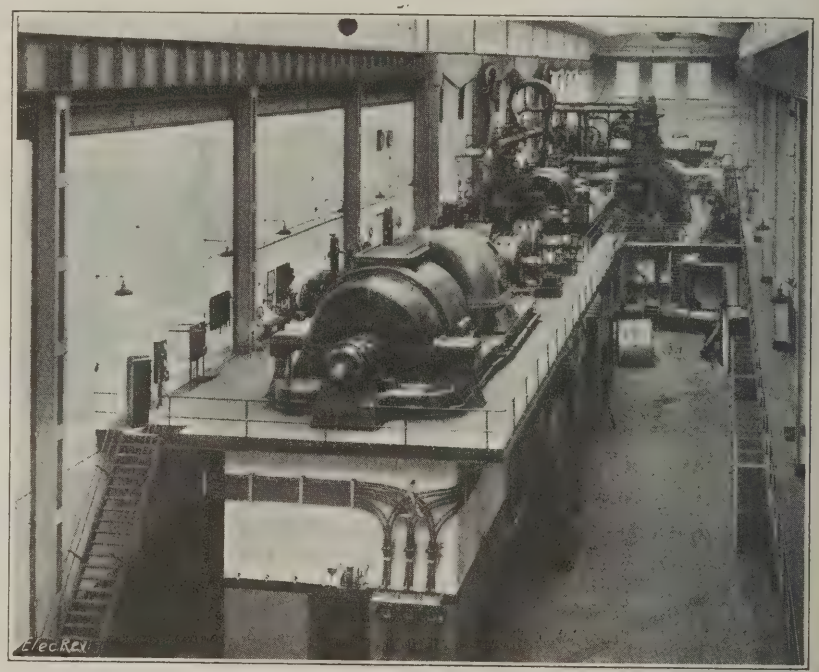

Fig. 4.—14,000-kW Turbo-Alternator.

The e.h.p. switchgear is of the Reyrolle type, and provides for the control of the alternators, motor generators, two transformer banks, and nine outgoing feeders. The bus-bars are in duplicate, coupled together through section switches. Five per cent. reactances are fitted between the two halves for limiting short-circuit currents. The solenoids operating the 11,000-V switches are controlled from the gallery above, energy being provided by a 110-V Chloride storage battery of 750-Ah capacity. This battery is housed in a building outside the power house, and is arranged to supply emergency lighting for the station.

The control room is situated in a central position. A schematic diagram in this department shows the position of all the switches, and ammeters are fixed on the diagram so as to indicate the disposition of the load. A 440-V B.T.-H. switchboard is so arranged that the various auxiliary motors can be supplied from either the turbine or transformer plant. Tirrill regulators are fitted for the voltage control, and a complete system of protective gear is fitted to both the machines and cables.

Outside the power house on the river bank is situated

the pump house and screens, and also the chlorinating plant. Owing to the sudden rise and fall to which the river is liable, this plant called for special attention. The suspended matter in the water varies greatly, and at times the contents include a good deal of slime, but it is found that the chlorination of the water materially reduces the deposit in the condensers. The screens are of the revolving type, and are fitted with two rows of internal nozzles for washing the collected matter clear. There are three main circulating pumps of Messrs. Allen's manufacture, two with capacities of 1,200,000, and one 810,000 gal. per hour.

All the feeders leaving the works are at present working at 11,000 V, although two main routes have been constructed to operate later at 33,000 V. There are approximately 102 miles of e.h.p. overhead mains and 109 miles of underground cable on the system. In every case the pressure is stepped down direct. Fig. 6 shows a section of a 33,000-V line, at present operating at 11,000 V, running down a sharp incline. A map showing the principal lines is shown in fig. 5.

The company supplies to some 80 collieries and industrial undertakings and about 22 authorised undertakers, representing an aggregate connected load of over 90,000 kW.

At the opening ceremony the Earl of Plymouth paid a high tribute to the work of the directors and staff of the undertaking, and remarked that the present output was ten times greater than that in 1908. He made a special plea for a close understanding between the directors, staff, and consumers, and remarked that the company was doing all it could for the prosperity of the district by supplying cheap power.

Mr. W. North Lewis, chairman of the company, replied to the Earl's speech, after which the visitors were entertained to tea.

We are indebted to Mr. W. A. Chamen, M.I.E.E., engineer and general manager, for the opportunity to obtain the foregoing particulars, and to Mr. C. T. Allan, M.I.E.E., deputy engineer, for his assistance in the preparation of the above notes.

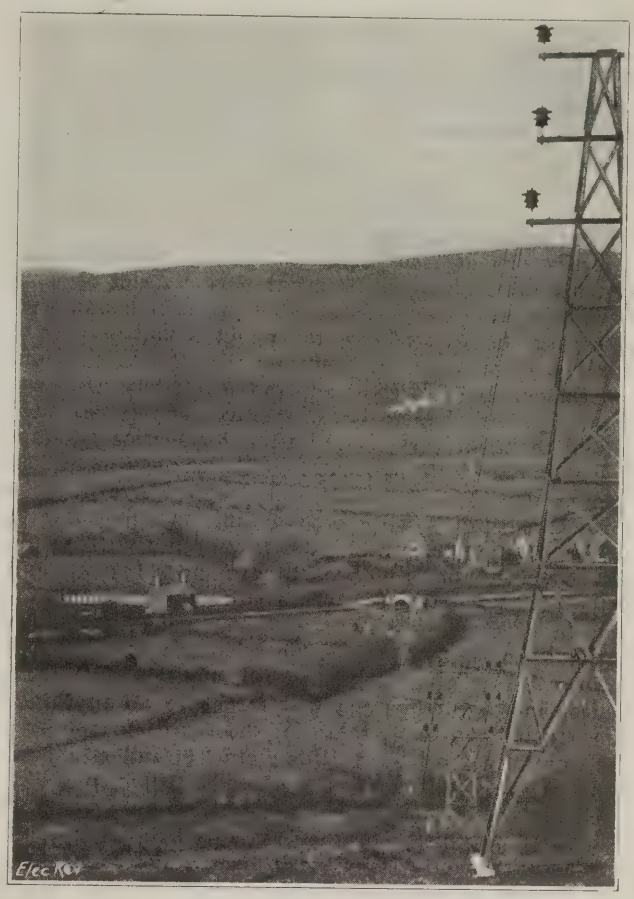

Fig. 6.—33,000-V Overhead Line.

The Ideal Wiring System.

A comparison of the several wiring systems that are available, with a view to deciding which, in the author's opinion, approaches nearest to his ideal for ordinary domestic wiring.

By H. R. TAUNTON.

(*Concluded from page* 672.)

Let us turn now to the main question of "expectation of safety." It is unfortunate that in private houses this is generally less than the high-standard heavy-gauge system can give in factories and public buildings. This is largely because there is a greater tendency in a house job to keep the tube sizes down to the barest minimum, partly to avoid cutting away and partly to avoid unsightliness. There is also a greater tendency, for æsthetic reasons, to depart from the conception of a completely ironclad system, particularly at switch and fitting points. The results are defective bonding, injury to insulation by jamming and forcible pulling-in, abrasion on the sharp edges of unbushed outlets, and so on.

But the most serious troubles in a heavy-gauge conduit system are likely to be those due to condensation. And unfortunately the best workmanship is powerless to avoid them, particularly in a private house. In a factory it is possible, with care, to arrange for a certain drainage; but in a house one cannot cut joists to varying depths to allow the conduit to slope, or arrange to drain outlets to the detriment of expensive decoration. Moreover, the effects of condensation in the very variable temperature of a house are probably more definite than in an unheated factory. A watertight system which accumulates water within is the paradox that follows, and the eventual effects on rubber and steel of continual moisture are easily imagined.

I have seen a nine-year-old conduit—light gauge—represented by a red-brown streak down the wall. It will be interesting in twenty years' time to examine the condition of the thousands of heavy-gauge installations which have been put in private houses since the system came into vogue, and to see what remains of the claims of mechanical protection, flexibility, adaptability, and all the rest of it.

Let us now consider class *d*, comprising all the many systems of metal-sheathed wires which I have loosely called "lead covered." Just as heavy-gauge is admittedly the best for the majority of public buildings, so is lead-covered (or some similar system) almost as certainly the best for private-house work, particularly for surface work. Of its merits I need say no more than I have of those of conduit—the various makers' lists will more than supply the deficiency. The only criticism that is likely to be of value in the present discussion is what will not be found in those lists: destructive criticism. Suffice it to say that lead-covered

systems give all the mechanical protection necessary in practice in a private house; that they are easier to erect and far neater when erected than conduit; and that, *a priori* at least, their chances of long and efficient life are greater, due mainly to the absence of condensation.

It is when we come to estimate their chances of being erected so as to provide a reasonable margin of safety that they are easier to criticise. Apart from the possibility of damage to the core by bruising or kinking due to careless handling, their one great defect is that their efficiency depends entirely upon the care taken by the erector to bond the system throughout.

Every one of the scores of patent metal-sheathed systems includes as an essential part a series of more or less ingenious and complicated junction boxes, with elaborate clamps and terminals and a multiplicity of fiddling little screws. Assuming that a conscientious contractor, and his foreman, and ultimately his wireman, uses one of these boxes wherever one is needed—which, to begin with, is too often a generous assumption—we have still to reckon on the chances of broken clamps, damaged terminals and dropped screws. The wireman, being a very human soul, is not going to grovel among dark and dusty joists for a microscopic bit of metal, nor is he keen to dismantle his box and replace it by a new one. There is thus a great temptation to effect some sort of wedging makeshift, which works loose as soon as the floor boards are fastened down. A slovenly workman will do the same from choice, and a careless one will forget to do anything. The result is a long tale of the familiar troubles: electrolysis, corrosion at clips, cracks and pinholes, over-heating, and continual danger of breakdown, shock and fire. I am perhaps painting an over-black picture of possibilities rather than probabilities. But they are sufficiently common to justify the argument; and that they are not more common is due more to the inherent safety of electric lighting than to the so-called "foolproof" qualities of any of these lead-covered systems.

If now we turn to the last class we have to consider, *c*—cab-tire—we find a system which, being neither metal-sheathed nor protected, dispenses at a stroke with all need of bonding and earthing, and so with all the dangers attendant on neglect to do so. It is a system so simple to erect that a man of even less than average skill and carefulness can hardly fail to secure with it the necessary margin of safety; and in this respect—which we have agreed is by far the most important—it approaches more nearly than any other the ideal of which we are in search. It must be admitted, however, that in some other respects it does not compare so favourably with either conduit or lead-covered; so that the question whether we can make it our final choice depends on whether its shortcomings in these respects are sufficiently small to be compensated for by its definite superiority in "expectation of safety."

Before leaving the question of safety, too, it must not be overlooked that there is at least one point where carelessness in erecting cab-tire may mean potential danger. In stripping off the outer sheathing when preparing the ends, a man is apt to injure the inner insulation of the conductors at the point where they are in closest contact, emerging from the sheath. There is the same danger, of course, in lead-covered twin cables, but it is somewhat greater in cab-tire, as the difference in "feel" between the sheathing and insulation is not enough in itself to arrest the knife at the crucial point. It is a risk, however, which the competent erector avoids easily enough in practice, whether with cab-tire or lead-covered.

An obvious point where cab-tire compares poorly with conduit and, in a less degree, with lead-covered, is in mechanical protection. Certainly it would not stand attack from a nail or a sharp cutting instrument as would conduit. On the other hand, such possibilities, which it has already been argued are almost negligible in a private house, can be guarded against easily enough in various ways. It has been suggested, for instance, by certain cab-tire makers that chases for concealed wires can be made good with cement floated directly over the wires. They may be right, but it is not an appealing suggestion. In such cases some form of metal protection seems to me to be preferable, such as painted steel strip, or sherardised capping, or oval tubing.

Protection for cab-tire between floors and ceilings should be less necessary than it is for v.i.r. cables threaded through joists. It is a fact, however, despite disclaimers to the contrary, that rats *will* attack cab-tire, as indeed they will v.i.r. or wood casing, or anything else they can get their teeth into. I remember, some years ago, sending to a well-known firm of cab-tire makers some samples, taken from a rat-infested country house in East Anglia, which were a convincing proof of its susceptibility to attack by vermin. The fact was beyond dispute; and in due course I was sent a special coil of cab-tire, the rubber sheathing of which, the makers wrote, had been specially impregnated with some dope abhorrent to rats. They asked me to make a test of it. As it happened, it was a long time before the opportunity occurred to install it in a suitable house; and then the results were negative. A year later the cab-tire was untouched; but that proved nothing one way or the other. However, I cannot believe that any rat—unless there are dietetic faddists among rats as among humans—would make a meal of hard rubber unless he were forced to it by circumstances. Rats, like rabbits and other rodents, are accustomed to use definite run-ways, and the probability is that the original cab-tire happened to have been fixed across one of these tracks and was only attacked by way of removing an obstacle to traffic. In rat-infested houses, therefore, it should be possible to guard against such attacks by a little discrimination in arranging the run of the cab-tire.

Another point on which cab-tire is at some disadvantage compared with lead-covered cable for surface work, is that of sightliness. Lacking a metal casing, it is less rigid and more difficult to erect in clean, straight lines. However carefully a twin 3/22 circular c.t.s. cable is erected, and with however many clips or saddles, it is impossible to run it with the mathematical neatness of, say, Stannos, or a Henley twin. The objection can be largely met by using twin 1/.044 flat instead of the stranded circular, the greater stiffness of the wires and the wider section of the sheath assisting it to keep its shape. The flat cab-tire, too, casts a smaller shadow—and it is the extent of its *shadows* which largely determines the sightliness or otherwise of any surface system, a point not always realised. In practice, the smaller the shadow the less the wiring is noticed, irrespective of its actual size. From that point of view I would suggest that a D-section cable with a smooth matt surface would be the best possible for surface work, if practicable from a manufacturing point of view.

Another drawback to the use of cab-tire is that none of its makers have provided cheap and *simple* joint boxes for use with it—or if they have they do not seem to be proud of them, for we never hear of them. In the absence of the complications of bonding it should surely be an easy matter to design a plain non-metal box with terminals for jointing, teeing, or looping. As it is, one has to make shift with such unsatisfactory substitutes as three-plate ceiling roses.

Another minor drawback—an artificial one created by the I.E.E. rules—is that it is not easy in a cab-tire installation to comply with the regulation providing for the earthing of domestic apparatus. That, however, will not unduly distress the common-sense of the contractor, unless something of the sort is needed in a bathroom, and there the proximity of waterpipes suggests an easy solution of the difficulty.

There are perhaps other small objections to cab-tire, as compared with other surface systems, which I may have overlooked—always ignoring the question of cost, which in any case is a small matter, one way or the other, with any of these systems. The sum of all its

minor drawbacks, however, does not, in my opinion at least, outweigh its manifest superiority over others in the facilities it offers for the erection of a safe and trouble-free installation. It will be gathered, then, that cab-tire is my final choice. If, as premised in the second paragraph of this article, I were wiring my own house regardless of cost, it would be with cab-tire, everywhere concealed, and protected, where really necessary, by narrow sherardised capping or the like, and fitted with solid hardwood switch and fitting blocks, fireproof lined and painted, and with some simple form of insulating junction box wherever required.

That, in fine, is my personal ideal of a wiring system for private houses. It is waiting for the ideal client of my imaginative dreams who will some day come to me and say: "I want my house wired in the safest and most permanent way, on the best possible system. I leave details to you—hang the expense!"

The Electric Furnace in Industry.

The rise of a formidable competitor to established methods of industrial heating.

(COMMUNICATED.)

A CAREFUL perusal of some of the results which are gradually becoming available of the application of electricity to industrial heating and metallurgical operations, varying from the fusion of metals down to operations at lower temperatures such as carburising, annealing, normalising, reheating, and japanning, show that for many of these processes the electric furnace has definitely passed out of the realm of laboratory appliances, and is now about to take its place as a serious competitor of some of the older established systems of heating, particularly gas and oil.

Up to the present, the amount of available information upon industrial processes served by electricity is scanty when compared with the figures which are available in respect of competitive fuels which have been longer in the field, but recent electrical process is decidedly interesting to the manufacturer who is seeking a system which combines close (and sometimes automatic) control of temperature with a cost which does not exceed that of gas. On account of the paucity of data, there is a slight difficulty in making rough comparisons in deciding which out of the many and varying figures which are available for other systems shall be taken as typical results. The fuel cost per unit of output (although it is only one of the factors which require to be considered in furnace work) is usually the most important item, and certainly one which receives first consideration when any new installation is contemplated. It is interesting, therefore, to notice that some of the recent electrical results compare favourably with the fuel costs for similar operations when gas is used, as it is probable that it is with the latter fuel that electricity compares most closely in heat-treating operations, and with which competition is likely to be keenest in the early stages of the trade. As a basis of comparison for arriving at the £ s. d. aspect of fuel costs, as distinct from actual thermal efficiency, it would be reasonable to base the respective prices upon the rates charged in a typical Midland centre where the use of both gas and electricity for general industrial purposes has been well developed by the respective supply undertakings. Electricity is taken at .75d. per unit, which is the actual figure for a low-voltage supply, although high-voltage is available on slightly more favourable terms; gas is taken at 2s. 3d. per 1,000 cu. ft. In some of the common processes which absorb the greatest numbers of furnaces of all systems, some recent results compare as follows:—

Process.	Gas per ton output. Cu. ft.	Price.	Electricity per ton output. Units.	Price.
Melting, brass	7,324	16s. 5d.	224	14s. 0d.
Annealing, mild steel ...	6,253	14s. 1d.	191	11s. 11d.
Annealing, nickel or metals at 750 deg. C.	5,734	12s. 10d.	167	10s. 5d.
Annealing, brass	4,060	9s. 1d.	121	7s. 6d.

Against the fact that the electrical results quoted are isolated instances, compared with figures selected from a mass of results obtained in an industry wherein development has been intensive for the last fourteen or fifteen years, it is justifiable to infer that even the electrical figures quoted will be improved upon as this type of furnace comes into more general use. Such figures, however, make it evident that the use of electricity for metallurgical operations is destined to increase greatly in those districts where the supply authority is sufficiently far-sighted to appreciate the influence of such a load upon revenue, and able to put into force a tariff which will encourage the development of the trade.

Apart from the consideration of price, there appear to be at present two main obstacles to be overcome before the use of electric furnaces can become as general as gas. The first is the scarcity of electrical engineers who have specialised upon the metallurgical side. An electric furnace, to be successful, has to combine the experience of the electrician and the experience of the metallurgist, and at the present time the number of instances is very small indeed of electrical training being combined with a thorough experience of the hundred and one different trades and processes to which such plant has to be applied. In the construction of coal, gas, and oil furnaces, the problems encountered are comparatively simple, and there is little in the design of such plant that an efficient engineer or designer from any other branch of the engineering trade cannot readily cope with; the most valuable part of the experience of the designer and the most difficult of acquisition is the requisite wide knowledge of trades and processes, each one of which has its special requirements and prejudices, joined to an equally thorough knowledge of the possibilities of his own medium applied to such processes. The latter must be sufficient to enable figures to be quoted as to consumption, output, and upkeep, in terms which usually have to be so precise as to amount to a guarantee if business is to be secured. If the older branches of the industry are none too well provided with designers of this wide experience, the number is bound to be far less on the newer electrical side, which obviously necessitates considerably higher qualifications, and it is this aspect of the personnel question which will have a material effect upon the rate of progress of the electric furnace for some time.

Apart from the need for increased study of metallurgical problems and general heating work by electrical engineers, the other obstacle which requires to be overcome is the scarcity of effective publicity on the subject of what can be done by electricity in this new field. Before any considerable progress can be made, there is need for publicity of the type which is so well provided by the Electrical Development Association for domestic apparatus. In this connection, it is interesting to recall that the co-operative publicity of the gas industry in the first stages of the movement was concentrated exclusively upon domestic appliances, in precisely the same way as in the electrical trade. Given the necessary publicity and continued interest, recent developments show clearly that it is in the power of electricity supply undertakings to develop a considerable industrial furnace load with profit both to supplier and user.

The Cork Broadcasting Station.

Brief technical details of the "Standard" equipment installed in the new Irish Free State station, including the latest form of condenser microphone.

THE new broadcast radio-telephony transmitting station at Cork, which was formally inaugurated on April 25th by Mr. J. J. Walsh, Minister of Posts and Telegraphs, has been built to serve the South and West of the Irish Free State, in which localities crystal set users have hitherto not had reasonable reception facilities.

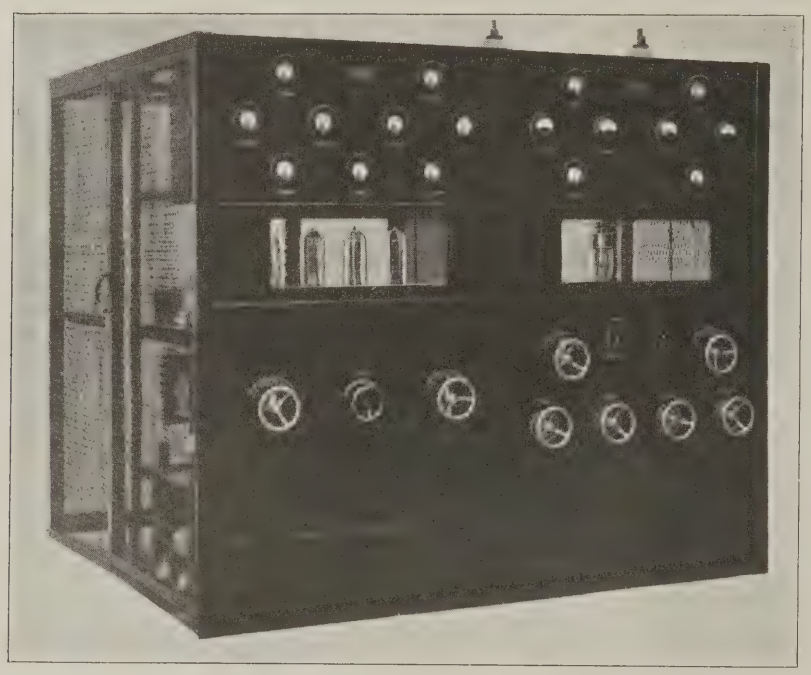

Fig. 1.—"Standard" Broadcasting Equipment at Cork.

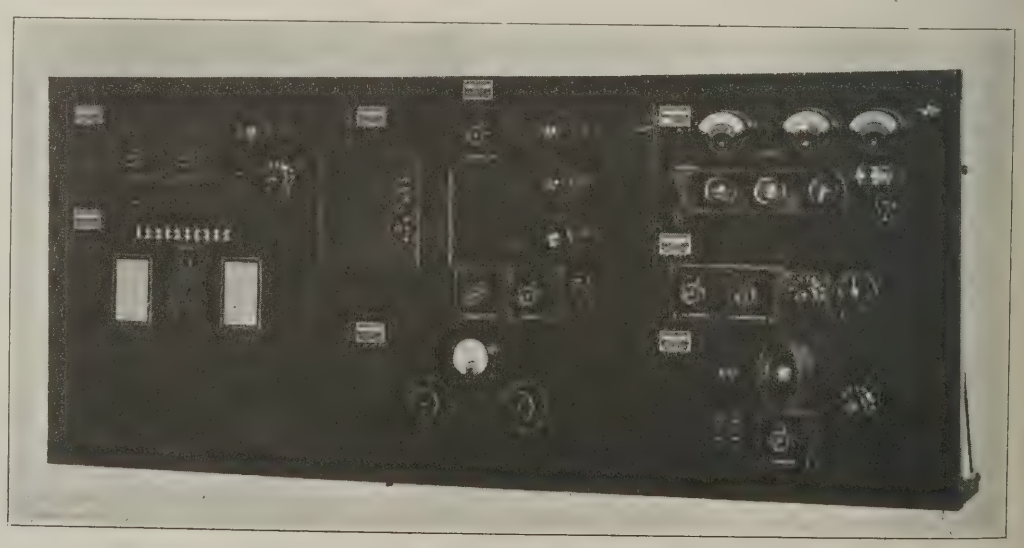
The power required to operate the complete station is 9 kW, but its Geneva rating is 1.5 kW: that is to say, 1.5 kW is fed to the oscillator, which, in turn, delivers 1 kW of unmodulated power to the aerial system, so that with 100 per cent. modulation a "peak" power of 4 kW can be dealt with by the apparatus without introducing distortion. The station is operating on a wavelength of 400 metres and its call letters are 6CK.

The aerial and earth equipment was constructed by the Ministry, and proved to be a somewhat difficult undertaking, as it has been erected on the elevated site of the disused prison at Sunday's Well. The inverted L-type aerial, consisting of four wires each 156 ft. long, is supported by two masts 100 ft. high. The 7/22 s.w.g. buried earth mat covers an area of 20,000 sq. ft., and facilities have been provided for the use of an insulated counterpoise, if required. Motor-generators fed from the public electricity mains provide the entire power required for the plant.

The transmitter, erected by Standard Telephones and Cables, Ltd., is modelled on the same lines as 38 stations which this company and its associates have constructed in various parts of the world. In the modulation system the carrier current is generated at a very low-power level by means of a specially stable master oscillator, which maintains the frequency constant to less than 0.01 per cent., and the modulation is performed at low power, the modulated wave being subsequently raised to the output level by successive stages of power amplification. The carrier frequency is entirely unaffected by modulation, so that the highest quality is maintained, even when the transmission conditions are so bad that fading is noticeable, or when the receiver is placed in a badly-screened position.

The aerial is capacitatively coupled, which arrangement secures high quality, regardless of the percentage of modulation, and also minimises the radiation of harmonics of the carrier frequency, so that interference with wave-lengths other than that used is reduced; the characteristic is maintained approximately flat up to at least 80 per cent. modulation, and a further advantage of the system is the silence of the carrier, no sound being perceptible until modulation actually commences.



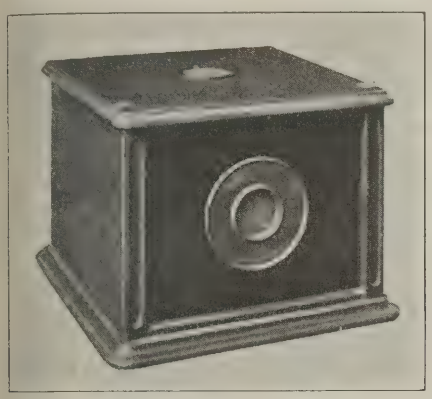


Fig 2.—Speech Input Apparatus in the Control Room Adjoining the Studio.

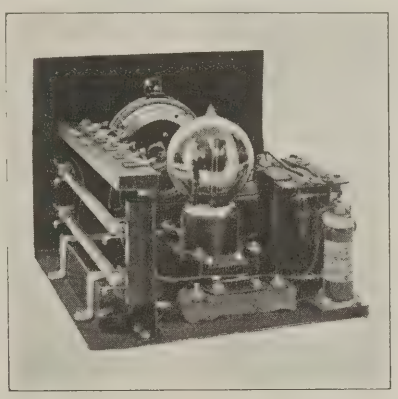


The transmitter is designed for operating upon any wave-length between 200 and 600 metres, and can be changed over from any one wave-length to any other within this range in about 20 minutes. The equipment (fig. 1) is neat and completely enclosed at the

back by a protective cage; a protective relay system has been provided, the operation of a single press button starting or stopping the whole unit.

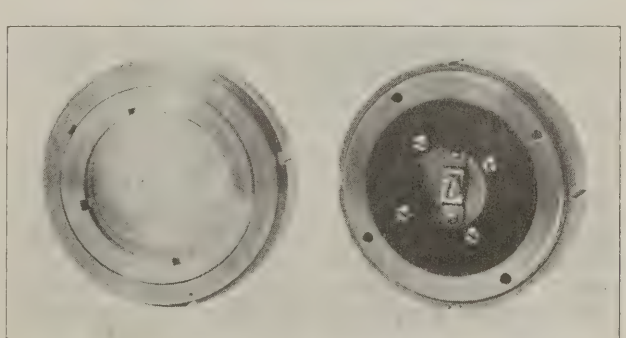
The master oscillator, a Colpitt circuit using a 4211-D valve, is contained in a brass-lined box in order to eliminate interference by external fields: its high-frequency output is fed to the grid of a 4211-D master separator valve, the output of which is bridged by a non-inductive potentiometer, by means of which the feed to the modulated amplifier is regulated.

The level of the incoming speech currents is suitably reduced by an attenuating network and supplied to the input transformer of the 4211-D speech-amplifying valve, the output of which is choke-capacity-coupled to a 4212-D valve acting as modulator; the latter further

Figs. 3 and 4.—Condenser Microphone, with and without Cover, showing Amplifier.

amplifies the voltage variations corresponding to the speech, and sets up across a high-impedance choke coil (actually two coils in series) in the common high-voltage lead to the modulator and modulated-amplifier valve a correspondingly varying potential difference, which is thus impressed upon the high-voltage supply to the modulated-amplifier valve; the high-frequency output of this valve is thereby modulated in accordance with the voice-frequency currents supplied to the input terminals. This method of modulation is known as the "Heising" or "constant-current" method, and has been proved to give the highest-quality reproduction.

The modulated amplifier and all the subsequent ones are biassed to "cut-off," enabling the whole of the valve characteristic to be used to ensure maximum output: capacity coupling eliminates radio-frequency harmonics generated in the amplifiers, the output in each case being transferred to a tuned inter-stage circuit through a "stopping" condenser; any speech-frequency components which, if allowed to pass, would introduce distortion are bye-passed by means of large radio-frequency choke coils shunted across the tuned circuit. In each case a non-inductive resistance across the coupling generator maintains a steady load on the preceding amplifier by reducing the percentage variation due to fluctuation in the grid impedance of the next stage.



The first power amplifier stage consists of two 3212-D valves in parallel and the final stage of one 4288-A water-cooled valve; in the first amplifier stage, inter-valve oscillation or "singing" is prevented by radio-frequency chokes in the plate circuit of each valve. Initial adjustment of the tuned circuits is made at the back of the units by varying in steps both the inductance and the capacity, to permit proper matching of impedances between the output circuits and the valves: fine adjustment is made while the transmitter is actually operating by geared handwheels on the front of the panels, which operate sliders on the last three turns of the coils.

In both the power-amplifier stages the plate current return leads are connected to the electrical centre point of the filaments in order to ensure freedom from ripple and equalisation of the load on both halves of the filament; the centre point is obtained in the first stage by means of a capacity bridge across the filament bus-bars, and in the second stage by means of a resistance-capacity bridge similarly connected; both stages are fed by the same generator. In addition, in the filament circuit of the second stage there is a reversing switch for periodically changing the direction of the current through the filament and also a compensating resistance for accommodating valves having different filament characteristics, the proper adjustment being indicated by a letter etched on the glass of the valve. The oscillator-modulator also contains smoothing systems in the plate and grid supply circuits. The output of the power amplifier is transferred through a "stopping" condenser to a tuned closed circuit, which provides for the elimination of harmonics and for the proper matching of impedances in the amplifier plate and aerial circuits. Capacity coupling is used between this circuit and the aerial circuits, the coupling condensers being common to both circuits and variable for regulating the power supplied to the aerial and for enabling aerials differing in radiation resistance to be used.

The filaments of all the valves are heated by a 24-volt generator, and by inserting resistance elements the voltage is reduced to 14 for the 4212-D and to 10 for the 4211-D valves; the resistance is divided, half being placed in each side of the circuit so as to enable the electrical centre-point to apply to all filaments equally. The plate of the water-cooled power amplifier valve operates at 4,000 volts above earth potential.

In the power circuits contactor 1 is controlled by the push-button switch and, when it operates, makes the field circuit of the 24-V generator, across which is a time delay relay so set as to allow 10 seconds for the filament of the power valve to heat up before the plate voltage is applied; it can only operate when the gate switch is closed, and closes the circuit across the 250-volt generator for contactor 2, which makes the field circuits of the high-voltage machine; the field current is also obtained from the 250-volt generator. An overload relay in the high-voltage return circuit operates if the total plate current exceeds some definite value, when it makes the circuit for contactor 3, which on the second contact breaks the circuit of contactor 2 and the high-voltage generator field.

In addition, speech input equipment (fig. 2) has been provided in the control room adjoining the studio, which can be used either with a double-button carbon microphone or condenser microphone; the latter consists of two metal diaphragms separated by an air gap

Figs. 5 and 6.—Condenser Microphone, Front and Back Views.

of 1/1,000 in., 150 volts being applied between the plates and the varying capacity resulting from speech vibration used to produce the speech currents. The instrument (figs. 3, 4, 5, and 6) is identical with that used by the Comité Consultatif International des Communications Téléphoniques à Grande Distance for the construction of an "ideally perfect" telephone system for use in its laboratories as a standard for comparison.

Imperial Development and Co-ordinated Investigation.

Transport is the key: Is it possible to build electric railways in the first instance? Geological surveys, combined with systematic co-ordinated investigation of natural resources, may lead to the development of cheap electric power and the establishment of industries to form a basic market therefor.

By DOUGLAS SPENCER.

WHILE all of us feel that psychologically the British Empire is developing on the right lines, few of us, we believe, will maintain that its development physically is being carried out on lines which, from the point of view either of speed or economy, can be considered to be the best to follow.

In looking at the question of Imperial development, or settlement, one is conscious of the existence of some sort of inertia, which in itself is so complex that it is highly difficult to analyse and therefore to overcome. None the less, as compared with the pre-war rate of progress, events are moving fast. Rustic knowledge of the Empire's resources has increased enormously. The events of the war have given us a much more intimate acquaintance with the Empire's varied inhabitants. The Imperial Conference itself, though but a triennial occurrence, is undoubtedly a great educative event, which has an immense Imperial advertising value, apart from the tangible results accruing from such meetings of Imperial statesmen.

Recent events have certainly turned the thoughts of the man in the street to Imperial matters to an extent not experienced before, and his thoughts are kept in Imperial channels by such bodies as the Imperial Economic Committee and the Empire Marketing Board.

There is always an extraordinary reaction taking place between buyers and sellers. A notable example is the case of Norway, whose experiments in partial prohibition threatened her fish and other trades with the wine-producing countries. It is the old story of the contra account—as between nations; so, when the Dominions carry out a zealous campaign for advertising and selling their waves, we anticipate an increased readiness on their part to purchase our goods.

The importance of the Dominion and Crown Colony markets is obvious to all interested in electrical manufacture, and it is therefore essential that it shall not reach saturation point, but that it shall be developed by every possible means in our power—first of all, by the development of primary resources in foodstuffs and minerals.

The electrical development of the Empire to-day is in that early stage where, if it is to be speedily and economically carried out by us, we must look at the question broadly and "see it whole." The adoption of the super-station in this country is accepted as the proper method of power generation. The principle is one that holds good equally in the component parts of the Empire, to foster the development of primary industries. The difficulty is how to find a super-load in sparsely-populated districts.

In some countries the basic electrical load is industrial and domestic; in others a wood pulp and paper industry; in others electro-chemical and metallurgical; in others mining and irrigation. There is no nation in the world which has to consider such a varied set of circumstances in the matter of the application of electrical energy as is to be found in the British Empire.

In examining an electrification project of any kind, we are naturally inclined to look for population as the key to its payability. But there is reason to believe that in most of our examinations we are liable to look too much at one particular phase of the possible use of electricity.

The less developed countries are a very fruitful field for research. The Rjukan hydro-electric development in Norway were not caused by population or anything already in existence, nor were the small electric railways between Notodden and Rjukan, nor was the electric railway from Lulea to Narvik in the Arctic Circle though it is 476 kilometres long.

Wherever there is cheap power available from water as at Rjukan, or from coal as at the Witbank Colliery there is room for the examination of the development of electrical energy on other lines than those to which we are accustomed in this country.

There are electrical schemes depending on electro-chemistry alone or on electro-metallurgy with no pre-existent industry. There are railways electrified where the passenger traffic is negligible.

There are in the British Empire countries in which somewhat similar developments might take place, each by itself. There are others, in which the establishment of an electrochemical or a metallurgical industry might cause power to be developed so cheaply that the electrification of existing railways and the building of new electric railways might become possible.

Transport is undoubtedly the key to Imperial development. Electrical transport should always be a very early consideration instead of being regarded as only possible of realisation when the country is in an advanced stage of development. A far from unimportant feature in connection with railway electrification is its effect on the siting and grading of the track by reason of the increased gradients which can be dealt with by electric locomotives.

One of the first questions a pioneer Government must ask is: "Is it not possible to build an electric railway in the first instance? Can heavy power using electro-metallurgical and electrochemical industries be established to form a large basic market for power, or can other industries be fostered to help in creating a market for power so that we may have cheap and efficient transport?"

The careful geological surveys which have been carried out in the Dominions, and similar surveys which have been or are being made in the Crown Colonies, form a very real basis on which to consider this question of development of the Empire by electricity. It is a process which is gradually being carried on in certain parts of the Empire, but one, the applicability of which to other parts of the Empire is left too much to chance, instead of being taken care of by a careful and systematic examination of the resources and power possibilities of the various component parts of the British Commonwealth of Nations.

Little by little the power possibilities of the British world are being realised, but it needs the combined brains of power engineers, electrochemists, electro-metallurgists, mining engineers and electricity supply and traction experts to work out a comprehensive scheme of development.

Canada is the one outstanding example of the utilisation of power possibilities to establish what are really primary industries, though some by speedy development have taken on the semblance of secondary industries.

Intensive agricultural development is naturally the first objective, artificial fertilisers and cheap transport follow as a corollary, and later comes the smelting of the native ores.

Calcium carbide and zinc have given Tasmania its electrical opportunity. Public utility demands and agriculture have given a similar impetus to the use of electricity in New Zealand. Zinc mining gives a market of some hundred million units per annum in one district alone of the Federated Malay States. Ceylon is about to develop her water power for public utility and tea estate purposes. The cotton mills of Bombay draw their motive power from the Western Ghats. The gold mines of Johannesburg are worked by power from the Witbank Collieries.

All these developments have taken place within the last 20 years. It needs only intensive and co-ordinated thought to achieve like accomplishments in other parts of the Empire, and we should like to see closer attention devoted to the question of trying to develop similar activities in all parts of the Empire by those who are acquainted not only with the resources of those parts, but also with the means whereby those resources can be utilised.

Wireless Retailers' Association.

Annual Meeting.

THE annual general meeting of this Association was held on April 6th. The Council and officers for the ensuing year were elected, and several alterations in the rules were passed after discussion. The hon. treasurer, Mr. H. C. Willard, reported that the financial position was eminently satisfactory.

In the course of his address, the Chairman (Mr. Horsey) said that numerous manufacturers, factors, and wholesalers were being constantly seen and communicated with regarding the interests of members and dealers generally. The efforts made by the Association in connection with the allowance of discounts to persons not entitled to trade terms alone had occupied an immense amount of time and trouble. The policy of circularising the trade on matters of general interest had been continued. A questionnaire was sent to some ten thousand retailers all over the country, and resulted in a mass of valuable information which had been duly collated and considered. The increase in membership was greater than in any preceding year. There was no better way of achieving the objects of the Association in important centres than by the formation of branches. Although every encouragement was given by the Council to those who would undertake the task, it was a matter for regret that more of them had not materialised. Since the last annual meeting the two associations, the S.R.M. and the N.A.R.M.A.T., which were then in negotiation, had amalgamated in the Radio Manufacturers' Association. So far as this materialised the policy, so long advocated by the W.R.A., of one association for each section of the trade it had their warmest welcome. The new body had not yet been long enough in existence for it to be known whether it was going to be an improvement on the older organisation in putting co-operation in the forefront of its policy. It was a matter for great regret that the factors and wholesalers had not yet taken the initiative in forming an association of their own. They felt that as the other great distributing section of the trade, a separate organisation representing them collectively would be a signal advantage. One or two matters could only be remedied by very special treatment and particularised organisation. These were price maintenance and the allowance of discounts to persons not entitled to them. Some little time ago the Council appointed a committee especially to consider price-cutting, and it concluded that it was necessary to form an association equally representative of manufacturers, factors, and retailers on the basis of the Proprietary Articles Trade Association, and that the object of such an association should be the taking of all legal steps to deal with the cutting of prices and the granting of trade terms to those not entitled to them. It recommended that the leading factors should be invited to meet it with a view to a joint consideration of the matter. The W.R.A. would use its utmost endeavour to secure the establishment of an organisation framed on the lines of the P.A.T.A. A number of leading factors and manufacturers held identical views, and many of them had already discussed the subject with them. Regarding the broadcasting programmes, Mr. Horsey said that an unofficial Trade Advisory Committee had been formed, but he thought that a committee appointed by the B.B.C. would be more acceptable. They claimed that their efforts to prevent the proposed raiding of broadcasting funds resulted in greater sums being made available for the broadcasting service than had been contemplated by the Government. It was still considered that the amount now allotted to broadcasting was too small for a service of such great recreative and educational value to the whole nation.

In conclusion, he said that it was more than ever necessary for them to hold together and to make their position impregnable against all assaults. They had recently seen the payment of a considerable sum to assist the formation of a rival retailers' association and the offer of free office accommodation. It was impossible too strongly to deprecate the dependence of any retail organisation on the subsidies of manufacturers. There was only one reply to that sort of thing and that was so to organise and strengthen the Association that no inducement, however great, would be able to split the ranks of the retail trade.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Broadcasting on Trains.—On April 26th, Mr. Day asked the Postmaster-General if his attention had been drawn to the coaches attached to trains on the Continent, in which a full service of broadcasting programmes was supplied to travellers on those trains; and whether he had received representations, requests, or applications from any of the railway groups in Great Britain for permission to install a similar service on the long-distance trains in Great Britain.

Sir W. Mitchell-Thomson said that he was aware that broadcast receiving sets had been installed in long-distance trains in some countries. Experiments conducted some years ago in this country showed that it was possible to receive broadcast programmes on trains in motion, but no application had been received for a licence for the permanent installation of receiving apparatus in trains.

Electricity in Mines.—On April 27th, during a debate on accidents in mines, Mr. Paling said that in Germany, where there was a far bigger proportion of winding engines driven by electricity than in this country, the number of accidents from overwinding was very much less. He asked what was being done by the Mines Department to encourage the use of electrical winding engines in this country. At the pits where electric lamps had been adopted the illumination was much better than was obtained by the ordinary flame safety lamp. But, after nearly 15 years' experience of electric lamps, there were still in use 580,000 ordinary flame safety lamps, as against only 366,000 electric lamps. One of the best ways of getting rid of miners' nystagmus was to adopt electric lamps. The main reason for not adopting the electric lamp was expense.

Mr. Walsh contended that many of the accidents in mines were directly traceable to the use of electricity. It was time that a new inquiry into accidents should be set up, or a new code of legislation established to deal with entirely new conditions.

Col. Lane-Fox, the Secretary for Mines, in reply, said he would be surprised to learn that it really was the policy of the Labour Party and of the Miners' Federation to discourage the use of electricity in mines. By all means let them make the use of electricity safer, but to talk about electricity as a danger that ought to be avoided was not the considered judgment of either the Miners' Federation or the Labour Party. One of the complaints that the Miners' Federation made before the Royal Commission was that this country was behind the times as compared with other countries with regard to electrical equipment in mines.

Wireless Calls to America.—On April 27th, Sir F. Wise asked the Postmaster-General if he could state the number of wireless calls between Great Britain and the United States of America from January 1st to the most convenient date; and if the service was paying its way.

Sir W. Mitchell-Thomson said that the total number of calls up to and including April 24th was 769. The service was not yet self-supporting. Receipts at present covered working costs, but not interest and depreciation.

Electricity Schemes.—On April 26th, Mr. Kelly asked for the number of schemes which the Electricity Commissioners had placed before the Central Electricity Board; and how many of such schemes had been sanctioned by the Board.

Colonel Ashley said that a scheme relating to Central Scotland had already been prepared by the Electricity Commissioners and transmitted to the Board for consideration. The preparation of a second scheme, namely, for Central England, was in an advanced stage.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

Metro-Vick Actors.

The Metropolitan-Vickers Dramatic and Operatic Society has added to an already long list of successful productions an excellent presentation of Ian Hay's play, "The Sport of Kings," given from April 27th to 30th in the well-equipped theatre which is part of the Metrovick Club, Stretford. The Metrovick Dramatic Society has now been in existence about seventeen years, during which time it has produced a large number of plays and musical comedies, some by well-known authors, but quite a number the original work of its own members. Amongst amusing productions in the latter category may be recalled "Polly Phase, or Life's Little Worries," and "Ali Baba and the Forty Salesmen."

Electricity in a Housing Scheme.

Upon the Richings Park Estate at Iver, Bucks., about two hundred houses, forming part of an estate, which will eventually comprise 2,000 houses, have been erected by the estate company, and each house has been equipped with electricity for lighting and heating and with electrical labour-saving appliances. Every room is installed with lighting points, and power plugs are fitted in the living rooms for use with electric fires, electric cleaners, &c. Two electric radiators are supplied as part of the property conveyed in the inclusive cost of the house, and other "owner's fixtures" include an electric cooker and electric washer in the kitchen, as well as an electric towel rail in the bathroom. Furthermore, each house is equipped with a complete two-valve radio set with loud speaker. Electricity is available at reasonable rates. The whole of the electrical fittings, fixtures, and household appliances, are of the "Magnet" type, and have been supplied by the General Electric Co., Ltd. The wireless sets are "Gecophone" models.

The Electrical Contractors' Association.

The Council has nominated Mr. W. A. Shaw, of Stockport, as president of the E.C.A. Allied Associations for 1927-28. Mr. Shaw has already occupied the position, having been president in 1912-13. Mr. W. H. Walton will continue in office as vice-chairman. The Association has produced a brochure in which are outlined the history of the organisation, its aims, and its achievements. That the Association is a "paying proposition" is emphasised in the publication, a fact which should impress those contractors who are not yet members.

Australian Company's Change of Name.

The Sydney *Sun* reports that the English Electric Co. of Australia, Ltd., proposes to change its name to Standard Waygood, Ltd. In a circular to its shareholders, the company stated that 5¼ years ago it purchased from the English Electric Co., Ltd., for £10,000 in cash, the £100,000 "A" ordinary shares issued to it eighteen months previously, when arrangements were made to use its designs and to represent the company in Australia. An agreement was made under which the company was permitted to use the words "English Electric," and to build electrical machinery of certain classes on the payment of royalties. The agreement proved unsatisfactory, and was terminated by mutual consent on February 28th last. The manufacturing licence from C. A. Parsons & Co., Ltd., was extended to cover the electrical generating plant of all descriptions.

Unemployment in Germany.

The returns of unemployment in Germany show that on April 15th the total was 1,221,000, as compared with 1,659,000 a month earlier.

Swedish Activity in Russia.

It is reported from Moscow that the Soviet Concessions Commission is in negotiation with the Svenska Allmanna Elektriska A.B., with a view to the latter's establishing works at Yaroslaff for the construction of electrical machines.

Austrian Electrical Industry.

The *Monthly Review of Central Europe*, produced by the Anglo-International Bank (Mid-April issue), states that the Austrian electrical industry is looking forward to important orders in the near future, partly in connection with schemes for public productive investments and partly from Russia.

Islington Exhibition Scheme Rejected.

The Lighting Committee recently submitted to the Islington Borough Council a proposal to hold an electrical exhibition at an estimated cost of £500. Mr. Gallichan, in opposing the motion, said that when it came to manufacturers advertising, the manufacturers should pay for it. If the Council wanted to increase its output of electricity it should abolish the guarantees required from consumers in the borough. The motion was lost, 20 voting for it and 25 against.

European v. American Meters.

In one of the last issues of the *Electrical World* to reach us (April 16th) Mr. R. H. Schofield, sales manager, Ferranti, Ltd., takes up the cudgels on behalf of meters not made in America. Earlier in the year our contemporary published an article entitled "Foreign and Domestic Meters Compared," the whole tone of which, says Mr. Schofield, was calculated to show that meters not made in America were so inferior that they were not worthy of serious consideration. We quote Mr. Schofield:—"This statement is not only contrary to the facts but is contrary to the figures of the tests as shown in the report itself. The following paragraph appears in italic type in the report: 'The committee on metering and service methods has not found any meter of European manufacture that performs as well as the American product and that can be bought f.o.b. any point in the United States for appreciably less than the domestic product.' The ambiguity of this paragraph is characteristic of the report generally. Careful reading of it discloses the following information: That European meters of a quality equal to American meters are much more expensive and that those meters which are available at a price equal to the American manufacturers' price are not good enough to use. The paragraph is so worded, however, as to indicate that the committee has not been able to find a European meter as good as the American ones. The plain facts are that European meters are available quite equal to those of domestic production, but owing to the tariff of 45 per cent., which is based upon the value of the meters in the country of origin, they are not available to the American user at an economical price. It would be misleading to your readers to assume that this condition applies in the rest of the world, where American meters are sold in competition with those of Europe in a ratio preponderantly in favour of European meters. There is no doubt that American-made meters have attained a very high standard of excellence, but it is equally true that European meters have of necessity attained a similar standard, and in reality the whole report could have been condensed into the following sentence: 'European meters of a class equal to American meters are not available to American users because of their landed cost being so much higher than that of the domestic product.'"

Platinum in the Transvaal.

Professor Kovaloff, the Russian platinum expert who has exhaustively investigated the Transvaal occurrences, has been appointed S.A. representative of the Berlin selling agency for the Russian product. He strongly urges that the establishment of a refinery in South Africa would provide the only hope of successful competition on the part of the local industry. Until recently the price of platinum had for some time ruled in the neighbourhood of £25 per ounce. It had been expected that the increase in the supplies owing to the production from Transvaal sources would be followed by a fall in value.

Unemployment.

There was an increase of over 28,000 in the number of unemployed during the week ended April 19th. At that date the total was 1,106,400, as compared with 1,078,250 on April 12th, and 996,650 on April 20th, 1926.

The Union Cable Works.

It is stated in German circles that the German Cable Works Company, of Berlin, is in negotiation for the re-acquisition of the factory at Dagenham.

Electrical Treatment at Torquay.

In a handsome official handbook of Torquay, which has been received from the authorities of that town, particulars are given of a very complete electro-medical service which is available to visitors. The modes of treatment include galvanism, faradism, sinusoidal currents, diathermy, high-frequency, combined heat and light baths, ultra-violet rays, Dowsing radiant heat, &c.

Battery Works Strike.

About 200 employés of the Sparkhill battery works of Messrs. J. Lucas struck work last week as a protest against a proposed reduction in the rates of pay. They returned upon the following day, the management having agreed to make a smaller reduction.

New Municipal Showrooms and Offices.

Morecambe Corporation Electricity Committee has asked the borough engineer to prepare a scheme for the provision of a showroom and offices for the electricity department.

Local Exhibitions.

Stepney.—An electrical exhibition, held under the auspices of the Borough Council Electricity Department (engineer and manager, Mr. W. C. P. Tapper), was inaugurated by the Mayor on April 29th, and continues until May 7th. The Council's stand serves as an inquiry bureau where information is given to visitors of the favourable terms of electricity supply, &c. The exhibition occupies two halls and a large variety of excellently displayed electrical domestic and other appliances are to be seen on the other stands, which total 30 in all. In the Winter Garden, the E.L.M.A. stand takes the form of a model shop window showing modern lighting methods; Messrs. Barrons (Leicester), Ltd., are displaying bakery machinery and butchers' meat-chopping machines; Automatic and Electric Furnaces, Ltd., exhibit electric annealing and steel-hardening apparatus; Messrs. Sager & Co. are demonstrating woodworking machinery; Messrs. Sadia, Ltd., are showing geysers and water heating apparatus; the Rowing Engineering Co. is displaying bakery machinery; and Messrs. George Nobbs, Ltd., exhibit electric water heaters and geysers. In the Queen's Hall, the stands are almost entirely devoted to the display of domestic apparatus. An extensive range of electric cookers, heaters, and general domestic apparatus is exhibited by the British Electric Transformer Co., Ltd., Hotpoint Electrical Appliance Co., Ltd., Cable Accessories Co., Ltd., Belling & Co., Metro-Vick Supplies, Ltd., Edison Swan Electric Co., Ltd., Berry's Electric, Ltd., Credenda Conduits Co., Ltd., and Jackson Electric Stove Co., Ltd. The British Thomson-Houston Co., Ltd., is making a special feature of its motors and wireless apparatus, and Messrs. John Bell & Croyden have an excellent display of Sunray and electro-medical apparatus. Motor-driven sewing machines are shown by the Singer Sewing Machine Co., Ltd., and Messrs. Wilcox & Gibbs. Lighting fittings and glassware are exhibited by the Wholesale Fittings Co., and Messrs. Hailwood & Ackroyd. In addition to its "Magnet" domestic appliances the General Electric Co., Ltd., is displaying portable tools and industrial apparatus. Messrs. Benham & Sons, Ltd., are showing electro-vapour radiators, Messrs. Aublet Homer and Co. are exhibiting cloth cutters, press irons, &c., Frigidaire, Ltd., refrigerators, the K.F.M. Engineering Co., Ltd., electric signs, and the Hart Accumulator Co., Ltd., accumulators and charging apparatus. Views of the Corporation's and the Edison Swan Co.'s stands are reproduced herewith.

The Council has introduced an assisted wiring scheme to encourage the use of electricity, and a scheme is being prepared to double the present capacity of the plant in order to meet anticipated demands.

Valuable assistance in organising the exhibition was given by the British Electrical Development Association.

Clitheroe.—The formal opening of a ten days' electrical exhibition took place on April 28th. The Corporation is introducing an assisted wiring scheme.

Glasgow.—The Corporation is recommended by a Committee to hold a Housing and Health Exhibition in the Kelvin Hall from September 21st to October 15th, 1927, and a Bakers' and Grocers' Exhibition in January and February, 1928.

New Swiss Companies.

A company has lately been formed in Neuchatel, with the title "M.S.N." Société pour la Fabrication et la Vente d'Appareils Electriques et Mécaniques, to manufacture electrical material, including radio apparatus.

A new company has been formed in Aarau under the style of the "Maxim" Fabrik Gesellschaft für Thermo-Elektrische Apparate to acquire and carry on the business of Zurlinden and Fecht, makers of electric heating and cooking appliances.

A new company has been formed at Kallnach, Canton of Berne, with the title Die Elektrochemische Werke Kallnach Gesellschaft, to acquire and carry on the Weinmann electro-chemical works in that town.

Proposed Whitley Councils Bill.

The National Joint Industrial Council for the Electricity Supply Industry was represented in a deputation from the Association of Joint Industrial Councils which attended the Ministry of Labour on April 26th in order to urge the necessity for legislation to give the joint industrial councils the same powers regarding enforcement of agreements, if and when such powers are requested, as are already possessed by trade boards and agricultural wages committees. The deputation was received by Mr. J. A. Barlow. It was emphasised that the Bill proposed by the Association did not impose powers on councils which did not seek them. An agreement would only become binding on a whole industry on application by the council concerned with that particular agreement. It was stated that 21 industrial councils and interim reconstruction committees supported the principle of the Bill; that eight which had supported it had ceased to exist largely through lack of the powers asked for; that a number of councils and committees were moribund owing to lack of powers; and that unless some legislative help was forthcoming the whole movement was in danger of collapse. The support of the Trade Union Congress and of the National Union of Manufacturers was also claimed for the principle of the Bill.

Mr. James Slevin stated that the Joint Industrial Council for the granite and roadstone quarrying industry in the South-West of England was holding together only in the hope of legislation. Employers who were loyal to their federation and who observed the agreements were suffering from grossly unfair competition. Peace in the furniture removal industry, it was stated by another speaker, was based on the hope of legislation. Mr. Bostock, ex-president of the Boot and Shoe Manufacturers' Association, stated that the only alternative to legislation was some sort of boycott of the offending employers or the withdrawal of labour by the unions. Mr. Barlow, who said that the Department had an open mind on the matter, promised to bring all that had been done to the notice of the Minister.

The Department of Overseas Trade.

The Times reports that the Swansea Chamber of Commerce has passed a resolution that the Chamber, "while deeply anxious that reduced national expenditure should be brought about, feels that the Department of Overseas Trade is of considerable value to the commerce of this country, and desires to remind the Government of the repeated requests of British Chambers of Commerce over many years for a Ministry of Commerce, and therefore urges upon the Government the desirability of continuing the Department in its present form."

Safety Lamps Order.

The Secretary for Mines on April 13th made an Order under Section 33 of the Coal Mines Act, 1911, approving for use in all mines to which the Act applies the following types of electric safety lamps, *viz.*:—

Beacon, Type B.
Derby Alkaline, Pillarless.
Derby Alkaline, Pillared.
Dominit, 2-volt.
Dominit, 4-volt.
Derby Bull's-Eye Type (for officials and for special purposes).
Wefco Hand Torch (for officials).

The Order also amends specifications of types of safety lamps (electric and flame) already approved.

New French Companies.

A company has been formed in Paris (10, Rue d'Uzes), with a capital of 18 million francs and the title La Société des Téléphones Grammont. The object of the new concern in which the Société des Etablissements Grammont of Paris, the General Electric Co., Ltd., London, and the Western Telephone Co., of Chicago, are reported to be interested, is to undertake part of the contract for the conversion of the telephone system in the Paris area to automatic operation.

La Société Central Lumière Province is the name of a company which has lately been formed in Paris (9, Place de la Bourse), with a capital of 500,000 fr., to establish electricity supply undertakings in the Vendée Department.

Trade Announcements.

The MULLARD WIRELESS SERVICE Co., LTD., has opened a new depôt at 13, Deansgate, Manchester. The depôt will carry large stocks, and is under the management of Mr. Y. W. P. Evans.

The address of the HALIFAX & BERMUDAS CABLE Co., LTD., and the DIRECT WEST INDIA CABLE Co., LTD., is now Spencer House, 4, South Place, E.C.2. Telephone: London Wall 9802; telegrams: "Quiescent, Ave, London."

MR. MAURICE BOBIN, 21, Warwick Lane, E.C.4, is shortly opening offices in Paris, and will be pleased to hear from British manufacturers wishing to be represented in France.

On and after May 9th the address of OLIVER PELL CONTROL, LTD., and TOK SWITCHES, LTD., will be Kingsway House, 103, Kingsway, W.C.2. (Telephone: Holborn 5303.)

MR. J. E. DAWSON, radio engineer, has opened new showroom premises at the corner of High Street, Boston.

MESSRS. CURRY'S, LTD., dealers in wireless and electrical goods, have opened a new branch business at 61, Hallgate, Doncaster.

MR. W. W. HITCHING, who, as announced in the ELECTRICAL REVIEW for February 25th, 1927, p. 299, purchased the business of Brittain's Electric Motor Co., Eastdown Works, Dermody Road, Lewisham, S.E.13, of which he had been general manager for many years, asks the trade to take note that a new company styled as Brittain's Electric Motor Co., Ltd., ELEC. REV., December 3rd, 1926, p. 925, is not in any way connected with his firm, and cannot supply the original Langdon-Davies or Brittain motors, or their spares or replacements.

POWER CONTRACTS, LTD., has opened offices at 78, King Street, Manchester, where Mr. J. Ditchfield, late sales manager to Messrs. E. Brook, Ltd., is in charge of sales and Mr. F. Bertwhistle in charge of estimating. Manufacturers' catalogues are asked for.

ELECTRIC ART SHADES, Feering Factory, Kelvedon, Essex, are opening a showroom under the supervision of Mr. G. York, late of the electrical department of Messrs. Harrods, Ltd., on May 16th, at Roxburghe House, Regent Street, W.1. (Tel.: Ambassador 9667.) Mr. K. G. GOULD, late of Messrs. Newmans, Ltd., has been appointed representative for the Midlands and Northern Counties, and Mr. R. T. HUNT has been appointed representative for the East and South-East Coast.

MESSRS. PRITCHETT & GOLD AND E.P.S. Co., LTD. (with which is incorporated Messrs. Peto & Radford), have appointed Mr. F. H. Durrant as their district representative for Northants, Beds., Berks., Bucks., Herts., and Oxfordshire.

New Catalogues and Lists.

BRITISH INSULATED CABLES, LTD., Prescot, Lancs.—Catalogue H.107—Mining Cables and Accessories, containing illustrated particulars of v.b., rubber, and paper-insulated cables, cable boxes, jointing materials, cable racks, insulators, wood poles, condensers for p.f. improvement, &c. Also an illustrated brochure (P.210) describing "Prescot" paper pinions.

DIXONIA, LTD., 4, Portsmouth Street, Kingsway, W.C.2.—A priced and illustrated list of lighting fittings, switches, and other automobile accessories.

The RAWLPLUG Co., LTD., Rawlplug House, Cromwell Road, S.W.7.—An illustrated booklet dealing with the many uses of "Rawlplugs" and methods of fitting them, and a leaflet containing particulars of the company's competition for builders, electricians, and others.

MESSRS. DAVIDSON & Co., LTD., Sirocco Engineering Works, Belfast.—An illustrated brochure detailing the achievements of a number of installations of the company's patent flue dust collectors.

The BRITISH THOMSON-HOUSTON Co., LTD., Crown House, Aldwych, W.C.2.—A folder containing illustrations and prices of electric lighting pendants of many designs, and hall lanterns.

IMPORTERS & DISTRIBUTORS, LTD., 173-175, Great Portland Street, W.1.—An illustrated price list of electric lamps.

MR. FRED J. DOWN, 90-93, Fenchurch Street, E.C.3.—Illustrated and priced pamphlets describing the "Scrulix" and "Harpoon" guy anchors for staying poles, steel chimneys, &c.

AUTO-BULBS, LTD., Sphinx House, Hatton Garden, E.C.1.—A price list of "Sphinx" electric lamps for house lighting.

W. T. HENLEY'S TELEGRAPH WORKS Co., LTD., Holborn Viaduct, E.C.1.—Leaflet No. 298, dealing with the company's c.t.s. trailing cables.

MESSRS. A. C. COSSOR, LTD., Highbury Grove, N.5.—An illustrated and priced folder dealing with the company's automobile lamps; arranged for overprinting.

MR. W. H. AGAR, 19, Whitecross Place, E.C.2.—A priced and illustrated list of oak and mahogany cabinets for Mullard receiving sets.

VAC-TRIC, LTD., 12-13, Henrietta Street, W.C.2.—A priced and illustrated pamphlet dealing with the "Vac-Tric" suction cleaner.

MESSRS. H. E. ASHDOWN (BIRMINGHAM), LTD., Perry Barr, Birmingham.—A mailing card describing the "Ashdown" shockproof lampholder.

HART ACCUMULATOR Co., LTD., Marshgate Lane, Stratford, E.15.—A pictorial showcard advertising "Hart" motor starting and lighting batteries. Also a calendar-blotter for May.

POPE'S ELECTRIC LAMP Co., LTD., 5, Arthur Street, New Oxford Street, W.C.2.—May calendar-blotter advertising the company's lamps.

THE UNITED ELECTRIC Co. (BIRMINGHAM), LTD., Coolex Works, Caroline Street, Birmingham.—An illustrated price list of "Coolex" fuse units, ironclad fuses, and distribution boards.

The RADIO COMMUNICATION Co., LTD., 34-35, Norfolk Street, W.C.2.—List R/427, describing, with illustrations, a long-range receiver, Type R.29, designed for the reception of signals from the Rugby high-power station.

Bankruptcy Proceedings.

C. P. MOODY (trading as the South-Eastern Manufacturing Co.), Crown Works, Finck Street, Lambeth, S.E.—The public examination of this debtor was held on April 29th at the London Bankruptcy Court, the accounts showing total liabilities of £773 (unsecured £716), and net assets valued at £140. In reply to Mr. Allcorn, Official Receiver, the debtor stated that in March, 1920, he commenced business as a battery maker under the above style; the trading was successful for a time, but subsequently declined owing to competition. In March, 1924, he discontinued making batteries, and had since dealt in lamp shades. Witness attributed his failure to keen competition and to depression in the lamp-shade business owing to change of fashion. The examination was concluded.

HARRIETT SPENCER, trading as Spencer & Son, 30, Watergate, Grantham, Lincs., wireless and cycle dealer.—The first meeting of creditors was held on April 22nd, at the Official Receiver's offices, Nottingham. The statement of affairs showed ranking liabilities of £349 and a deficiency of £323. Debtor attributed her failure to taking over the liabilities on the purchase of an insolvent business. She stated that the concern had belonged to a relative, and she and her husband had for some time assisted in the management. Debtor only admitted knowledge of her position a few days before the date of the receiving order, when the writ was served. The matter was left with the Official Receiver as trustee of the estate.

E. TEMPLE and JANE E. BURKETT, trading as "The Westoe Electrical Company, 105, Canterbury Street, South Shields, wireless dealers and electrical contractors.—The first meeting of the creditors of the above was held recently at the Official Receiver's office, Newcastle-on-Tyne. The statement of affairs showed liabilities of £950, against assets of £331. The creditors resolved to appoint Mr. A. J. Gray, accountant, of 48, Pilgrim Street, Newcastle, as trustee of the estate.

J. ATKINS (Atkins & Co.), electrical engineer, 59, Church Street, Tewkesbury, Electricity Works, Northleach, Glos., and at High Street, Winchcombe.—Receiving order made April 21st, on debtor's own petition. First meeting and public examination, May 12th, at the Court House, Cheltenham.

A. A. SMETHURST (A. Smethurst & Co.), electrical engineer, 62, Bernard Street, Southampton.—Receiving order made April 20th, on debtor's own petition.

P. FORD, electrical contractor, 4a, Macdonald Lane, Corporation Street, Manchester.—First meeting held May 4th, at the Official Receiver's offices, Byrom Street, Manchester. Public examination, May 27th, at the Court House, Manchester.

T. A. WICKHAM, electrical engineer, Snaresbrook, Station Road, New Milton, Southampton.—Trustee, Mr. H. Ashton, Official Receiver, Midland Bank Chambers, High Street, Southampton, released April 8th.

W. K. COXON (separate estate), trading together with E. R. Weare as the Western Mfg. Co.), electrical engineer, Nurshill, Lydney, Glos.—Last day for proofs for dividend, May 11th. Trustee, Mr. C. Latham, 78, New Oxford Street, W.C.

A. E. S. CHALLENER, wireless engineer, 277, St. Sepulchre Gate, Doncaster.—First and final dividend of 1s. 8d. in the £, payable at the Official Receiver's offices, 14, Figtree Lane, Sheffield.

H. Nutter, electrical engineer, 246, Yorkshire Street, Rochdale.—Receiving order made April 25th, on debtor's own petition.

A. H. Duffin and G. Kershaw (A. H. Duffin & Co.), electrical engineers and contractors, Provincial Buildings, Conway Road, Colwyn Bay.—Last day for proofs for dividend, May 11th. Trustee, Mr. I. D. Hooson, Official Receiver, St. Peter's Churchyard, The Cross, Chester.

E. Temple and J. E. Burkett (Westoe Electrical Co.), wireless dealers and electrical contractors, 105, Canterbury Street, South Shields.—Trustee, Mr. A. J. Grant, 48, Pilgrim Street, Newcastle-on-Tyne, appointed April 26th.

J. Turner, electrician, 62, Blackburn Road, Great Harwood.—Receiving order made April 26th, on debtor's own petition.

L. Bell (C. Bell), mechanical and electrical engineer, Joseph Street, Leeds Road, Bradford.—Receiving order made April 25th, on debtor's own petition. First meeting to be held May 6th, at the Official Receiver's offices, 12, Duke Street, Bradford. Public examination, May 24th, at the County Court, Bradford.

Company Liquidations.

Radi-Arc Electrical Co., Ltd., Bennett Street, Chiswick, W.—A meeting of creditors was held on April 27th, at the Institute of Chartered Accountants, E.C., when a statement of affairs was presented which disclosed liabilities of £3,598, of which £1,222 was due to the trade, the bank was creditor for £726 in respect of an overdraft, and there were partly secured creditors for £1,750, holding security valued at £100, leaving a balance of £1,650 to rank as unsecured. The net assets were £1,235, leaving a deficiency of £2,363. The liquidator, Mr. Ernest James, St. Lawrence House, Trump Street, E.C., said that the bank was guaranteed by Mr. Blaiberg, the loan creditor. The company was incorporated in February, 1919, under a different name. The name was changed to the present style in 1922. The business was formed by Mr. Blaiberg's son, but for the past two years he had been unable to do any work in connection with the company, and it had been managed for him, and had been financed by his father. The share capital was £200, all of which was put up in cash. The loan had been paid in cash; nothing had been charged by way of interest and no directors' fees had been paid. The company did a considerable amount of experimental work during the early months of its trading, and did not commence dealing in wireless goods until February, 1924. The loss sustained through the experimental work was about £200. According to a profit and loss account for the period to November, 1924, there was a loss of £1,148. During the next year to November, 1925, there was a profit of £760, and the last completed accounts, to September 30th, 1926, showed a loss of £809. Mr. Blaiberg might have been prepared to carry on the business, but recently three of the creditors issued writs, and subsequently the necessary resolutions for voluntary liquidation were passed. Mr. James said that a gentleman who was interested in wireless had offered to take over the business and pay the creditors a composition of perhaps 6s. or 7s. in the £. Mr. James, however, was instructed to make no definite offer, and even if an offer of 6s. or 7s. in the £ were made he would not advise the creditors to accept it at the moment. Mr. P. Houstoun, of the British Traders' Association, proposed that Mr. James should be continued as liquidator, together with a committee of inspection consisting of three of the principal trade creditors. That resolution was carried. The following are creditors:—

	£		£
Art Publicity Service ...	92	Hurst, H., & Co.	30
London Metal Warehouses	55	Brandes, Ltd.	26
Marconi Co.	62	Rad Vaco, Ltd.	25

American Hard Rubber Co.	27	Electron, Ltd.	20
		Standard Telephones & Cables, Ltd.	20

National Wireless Corporation, Ltd., 14, Cursitor Street, Chancery Lane, W.C.—Under the compulsory liquidation of this company, Mr. E. T. A. Phillips, Official Receiver and liquidator, has issued his report in great detail. We have not space to print it here. The winding up order was made last December on a creditor's petition. Mr. Phillips reports, *inter alia*, that the company was incorporated as a private company on February 24th, 1925, with a nominal capital of £1,000, subsequently increased to £3,500, in shares of 1s. each, for the purpose of carrying on the business of radio and general engineers, manufacturers, merchants, &c. The directors appointed by the articles were W. Wrentmore and R. M. Reith. H. N. Westgate, Sir Alexander Spearman, Bt., and H. C. Cowan were subsequently appointed directors. At the date of the winding up Wrentmore was the sole director. The statement of affairs lodged on January 27th, 1927, shows assets valued at £322, including a debenture in Natwirco, Ltd., £250 and 50 ordinary shares in Burndept Wireless. Unsecured creditors are returned in the statement at £388. On March 2nd, 1927 (in view of the fact that the interest on the debenture issued to the corporation by Natwirco, Ltd., had not been paid and that that company had discontinued its business, the Senior Official Receiver appointed himself receiver of the property charged under the debenture, and has since sold it for under £30. As the debenture, which was estimated to produce £250, was the corporation's principal asset, there appears to be no prospect of a dividend for the unsecured creditors or shareholders. The failure of the corporation is attributed by Wrentmore to the competition of amateur wireless manufacturers and to insufficient capital with which to open the multiple shops as intended. Turner agrees with Wrentmore's second cause of failure, and adds as a further cause the large commission paid to Hills, of the British Fiduciaries, Ltd., for capital obtained by him.

Electric Light & Power Contracts Finance Corporation, Ltd.—A petition for the winding up of this company has been presented to the High Court by Messrs. H. Saunders, Ltd., 40-41, Great Charles Street, Birmingham, and will be heard in London on May 10th.

Robins Wholesale Electrical & Wireless Co., Ltd.—A meeting of members is called for May 30th at 31, Queen Street, Cardiff, to hear an account of the winding up from the liquidator, Mr. S. E. Clutterbuck.

Electrical Cabinet Works, Ltd.—Last day for proofs for dividend, May 11th. Liquidator, Mr. H. E. Burgess, Senior Official Receiver, Carey Street, W.C.

Private Arrangements.

E. Edwards & Co., Great Eastern Street and High Street, Shoreditch, E., electrical and wireless factors.—A further meeting of creditors was held on April 29th, at the Institute of Chartered Accountants. The chair was occupied by Sir Harold Moore, 4, London Wall Avenue, E.C. The creditors were first called together in February, when the liabilities were stated at £28,867, against net assets of £17,564, and it was then intimated that bankruptcy proceedings would be instituted on behalf of a creditor. Sir Harold Moore stated that after the last meeting he was approached by a number of the larger creditors, and at their request a deed of assignment was executed to him on February 16th, and duly registered. There were difficulties in the way of an immediate realisation, and it was not at all certain when the deed was executed that the estate would not, within a very short time, be in the process of administration in bankruptcy. It was, however, desired to avoid that. He had carried on the business since his appointment, and reduced expenses. Certain of the preferential claims and the current expenses had also been discharged, and there was now cash at the bank to the extent of £4,074. There was still a substantial amount of stock in hand for realisation. At the moment there were two outstanding bankruptcy petitions. Resolutions were passed appointing a committee of five of the principal creditors to act with Sir Harold Moore in dealing with the estate under the deed of assignment; and asking the committee to take any steps necessary to oppose the bankruptcy petitions.

J. I. Lloyd, 36, Church Road, Ton Pentre, wireless dealer, &c.—The creditors were called together last week at Cardiff, when a statement of affairs was presented which showed liabilities of £495, all due to the trade. The net assets were £27, leaving a deficiency of £468. A resolution was passed agreeing to accept a composition of 3s. 4d. in the £, payable in two months and secured to the satisfaction of a committee consisting of the representatives of the South Wales Wireless Installation Co., Ltd., Messrs. Clarke, Dovey and Co., and Messrs. E. T. Collins & Son.

Book Notices.

"The *Electrician* Annual Tables of Electricity Undertakings, 1927." (Pp. vii+194). London: Benn Bros., Ltd. Price 10s. net.—An innovation in this, the 40th, edition is a complete index of the British undertakings dealt with in the tables. It is claimed that particulars are given of upwards of 800 British and 1,300 Colonial and foreign undertakings.

Messrs. Crosby Lockwood & Son will shortly publish "The Timber Trade of the United Kingdom," by Mr. Thomas J. Stobart; two volumes. 5s. each net.

The British Broadcasting Corporation has issued a 24-page booklet, illustrated with portraits of some of the lecturers, containing full details of the series of talks, lectures, and religious services that are to be broadcast simultaneously from all stations from May to July, inclusive.

Recent Contract.

The consulting engineers for the Ross-shire Electric Supply Co., Ltd., Messrs. Murdoch, Macdonald & Partners, have placed the contract for the supply and erection of the pipes, water turbines, and electrical plant required for the station at the outlet of Loch Luichart, with Messrs. James Gordon and Co., Ltd. The plant as at present designed covers the installation of two 750-h.p. Francis turbines working under a head of 110 ft. and running at 600 r.p.m. coupled to two 500-kW generators, together with switchgear, transformers, &c., and some 40 miles of transmission lines. The whole plant will be manufactured in Great Britain under the stipulations of the Trades Facilities Acts.

The accompanying picture shows Callender's Ladies' Hockey Team which has secured the London Business Houses Cup by

Callender's Ladies' Hockey Team.

defeating the Railway Clearing House ladies' team in the final round of the competition.

Electric Power in Industry.

Further trades are dealt with in Preliminary Report No. 9 upon the 1924 Census of Production published with the *Board of Trade Journal* for April 28th. The hosiery trade reported an increase in the installed generating plant from 827 kW in 1907 to 1,495 kW in 1912, and 3,661 kW in 1924. Motors aggregating 2,763 h.p. were driven by internally produced power, while electricity for a further 13,911 h.p. was purchased. In the glove-making industry only 10 kW of generating plant was in use in 1907; in 1924 the total was 370 kW. The electric motors in use totalled 665 h.p. (power for 478 h.p. purchased). The generating plant installed in the musical instrument trades was 304 kW in 1907, 2,369 kW in 1912, and 3,137 kW in 1924. The motor capacity was 14,644 h.p. (power for 8,740 h.p. purchased). The needle, pin, fish-hook and button trades reported 200 kW of generating plant in 1907, 307 kW in 1912, and 489 kW in 1924. There were 4,047 h.p. of electric motors, power for 3,609 h.p. of which was purchased.

Schools of Salesmanship.

The National Union of Commercial Travellers is making an investigation into the effect of Schools of Salesmanship upon the status of commercial travellers, and Mr. C. J. Kebbell, the honorary secretary (42, Blackfriars Road, London, S.E.1), asks any of our readers who have been in touch with such schools to send him particulars of their experiences. It is desired to make the inquiry an impartial one and views, favourable or otherwise, are invited.

For Sale.

Crowborough District Gas and Electricity Co. invites offers for one Taylor Scotson voltage regulator, with switch panel. Redheugh Colliery, Ltd., has for disposal one electric winder, complete with 255-h.p. Siemens motor and switchgear, electrically-driven main and tail haulers, air compressor, transformers, switchgear, &c. Whitley U.D.C. Electricity Department has for disposal one 100-kW Parsons turbo-alternator, with spare armature. Severalls Mental Hospital, Colchester, has for disposal one 75-b.h.p. semi-Diesel oil engine, complete with spares. Mr. J. H. Shaw will sell by auction on May 11th, at 13, High Holborn, W.C., trade stocks of wireless and electrical goods, &c. (See our advertisement pages to-day.)

Indian Companies.

The Aligarh Electric Supply Co. has been formed for the purpose of supplying electricity to the town of Aligarh, which has a population of 70,000. The capital of the company is Rs. 10 lakhs. The Punjab Government has recently given a licence to the Eastern Engineering and Commercial Co., Ltd., for the supply of electrical power to the town of Meerut.—*Reuter's Trade Service* (Bombay).

Prices of Raw Materials.

The following prices are only general, and they may vary according to quantities and other circumstances:—

CHEMICALS, &c.	Price May 3rd.	Fortnight's inc. or dec.
a Acid, Oxalic ... ... per lb.	5¾d.	...
a Ammoniac, Sal ... ... per ton.	£60	...

Reporting on April 30th, Messrs. James Forster & Co. stated:—"Closing prices for lead yesterday were £25 11s. 3d. for April, and £26 1s. 3d. for July, or about 10s. a ton lower on the week. . . . A little more interest has been shown this week by home consumers, though this does not apply to the cable trade, where makers are anxiously awaiting Post Office orders to keep their works employed. Arrivals, on the other hand, are still on the heavy side, and stocks have probably been increased this month to a small extent. Conditions on the Continent are steadily improving, and the weakness in the position has now shifted from there to America."

Lighting and Power Notes.

Ayrshire.—Special Order.—The Electricity Commissioners have made a Special Order authorising the Ayrshire Electricity Board to supply electricity for public and private purposes within the burghs of Girvan, Maybole, and Largs.

Barrow.—Extension Scheme Sanctioned.—The *Manchester Guardian* reports that, following upon the persistence of the Corporation's Electricity Committee, the Electricity Commissioners have sanctioned the extensions to the electricity works at a cost of £60,000. Originally this proposal was rejected, the suggestion being made that arrangements should be made with Messrs. Vickers for additional supply.

Bedford.—Loan.—The Corporation Electricity Committee is applying for sanction to a loan of £10,000 for services.

New Sub-Station.—The Committee is to erect a sub-station at Sandy.

Blackburn.—INQUIRY.—Criticisms of the Corporation Electricity Department in Blackburn are stated to be unjustified, but to reassure the public it has been decided to hold an inquiry into the general administration. The Town Clerk (Sir Lewis Beard) will be asked to name experts who may be selected to conduct the inquiry, the holding of which has met with the approval of the borough electrical engineer.

Bridlington.—ELECTRICITY SUPPLY.—The Corporation Electricity Committee has received a letter from the Electricity Commissioners stating that the question of extensions to the electricity works has been deferred in order that the question of the future of the Scarborough and Hull electricity undertakings may be generally considered as affecting the three centres. The Commissioners suggest that the Council should consider the advisability of collaborating with the Scarborough Corporation in order to examine the possibilities of either the joint purchase of electricity in bulk, or, alternatively, the erection of a joint station. The Committee's views in the matter are invited, and it proposes to ask Mr. S. B. Donkin, consulting engineer, to confer with the consulting engineer of Scarborough, the electrical engineer of the Hull Corporation, and the Electricity Commissioners, as to the advisability of both Scarborough and Bridlington taking a bulk supply from Hull, or the erection of a joint station for Bridlington and Scarborough, and to report to the Council.

Cardiff.—ASSISTED WIRING SCHEME.—The borough electrical engineer (Mr. Morley New) has submitted a report to the Electricity Committee on the proposed assisted wiring scheme. The installation costs would be £8 7s. 1d. for five points, £9 6s. 4d. for six points, and £10 5s. 6d. for seven points. The proposed charge for electricity is 8d. per kWh until the cost of installation has been met. The Committee has adopted the report which has been passed on to the Finance Committee for approval.

Carlisle.—INAUGURATION OF POWER STATION.—The new electricity works will be formally inaugurated by the Mayor on May 26th, and the first set will set put in motion by the chairman of the Electricity Committee. Sir John Snell will be the chief guest at the subsequent luncheon.

Continental.—BELGIUM.—In order to meet the increasing demand for electricity, considerable extensions are in hand at the central power station in Brussels of the Société Bruxelloise d'Electricité. The number of boilers is being increased to 18, and a new 6,000-kW steam turbo-generator is being installed which will bring the capacity of the plant up to 33,000 kW.

SWITZERLAND.—Our Swiss correspondent states that at the last board meeting of the Vaudois company "Forces Motrices des Lacs de Joux et de l'Orbe" some important decisions were arrived at, whereby the company henceforward will be linked up with the lines of the power-houses belonging to the "Energie-Ouest-Suisse," the connection being made at Romanel. The result of this arrangement will be that the surplus energy of the Peuffaire at Bex (due, under contract, to the "Forces Motrices des Lacs de Joux et de l'Orbe") will be distributed to the power stations of Ch. Bertolus, at Bellegarde, over the high-pressure lines of Romanel to Geneva, belonging to the E.O.S. Company.

The Energie-Ouest-Suisse Company has now resolved to construct a high-pressure line between the Chèvres power-house at Geneva and the French-Swiss frontier. There will be a measuring station at Chèvres, a relaying station at Romanel, a high-pressure line from Vernayez to Romanel, together with a transforming station at the latter; the E.O.S. will also finish the works at Champsec in the valley de Bagnes, as well as the high-pressure line from Champsec to Martigny, which will entail a cost of some ten million francs (Swiss).

POLAND.—La Société Centrale Electrique du Bassin de Cracovie, which is supplying electricity in the Cracow district, is increasing the capacity of its generating plant from 10,000 to 22,000 kW. The Société Centrale Electrique de Pruskow, which supplies electricity to the town of Pruskow and the industrial suburbs of Warsaw, is also increasing the capacity of its plant from 8,500 kW to 18,500 kW. A contract has recently been secured by this concern to supply the power required for the Warsaw-Grodzisk section (20 miles) of the Société Chemins de Fers Electriques Suburbains.

Eastbourne.—ELECTRICITY EXTENSIONS.—At a recent meeting of the Electricity Committee the proposed extension of area of supply was considered, and the town clerk was instructed to proceed with the application for the proposed Special Order and to oppose the applications for Special Orders which have been lodged by various companies to enable them to supply electricity in districts which it is proposed to include in the Eastbourne area.

Glasgow.—PROGRESS DURING MARCH.—Under the Corporation Electricity Committee's assisted wiring scheme 126 houses were wired in March, bringing the total to date to 3,478. The agreements during March under the ten years' hire-purchase scheme numbered 176, bringing the total up to 248. The hire of appliances in March numbered 174, making the total to date 14,749.

Guildford.—ELECTRICITY IN BULK.—At a recent meeting of the Corporation Electricity Committee the borough electrical engineer submitted correspondence with the borough electrical engineer, Aldershot, inquiring upon what terms the Corporation would be willing to give the borough of Aldershot a supply of electricity in bulk, and by what date the supply would be available. The Corporation replied that it would be in a position to submit terms and conditions for a bulk supply at an early date.

Hornsey.—LOAN SANCTIONED.—The Corporation Electricity Committee has received sanction to a loan of £6,500 for mains and switchgear.

India. — PUNJAB HYDRO-ELECTRIC SCHEME. — Considerable progress is reported with regard to the hydro-electric scheme on the Uhl River in the Mandi State in the Punjab. This scheme will supply electricity to the whole of the Punjab and is expected to cost about Rs. 8 crores. All preliminary work is now nearly complete. As the construction plant necessary for a scheme of this size involves a large and continuous demand for power, it was decided to erect a small water plant, and this of 960-kW installed capacity, under a 700-ft. head, is nearing completion. The power will be generated at 3,300 V a.c., and transmitted to the works area at 11,500 V. A system of electrically-operated cable haulage-ways up the hill side is being laid with connecting tramways at the crest and junction points. It is expected that the local power supply will be available, the tunnel drilling plant erected, and the driving of the tunnel commenced by July or August. As far as the transmission system is concerned, the survey of the trunk line from the power station in Mandi down to Pathankot has been nearly completed, and similar work has been started for the rest of the system.

Irish Free State.—PEMBROKE (DUBLIN).—On April 28th, the chairman of the Electric Lighting Committee formally started the new 840-b.h.p. Diesel engine which has been installed at the Urban District Council's electricity works at a cost of £12,000.

Japan.—NEW POWER STATION.—It is reported that the South Manchurian Railway authorities have under consideration the erection of a power station at Dairen with a capacity of from 30,000 to 40,000 kW.

Llandudno.—ELECTRICITY CHARGES.—The Electricity Committee of the Urban District Council has discussed the question of the price charged for electricity supplied to the Llandudno and Colwyn Bay Electric Railway, Ltd., and has decided to offer the company a reduction of 1/10d. per kWh in the present rate, to take effect from July 1st.

London.—BATTERSEA.—A Joint Committee of the Borough Council, reporting upon the application made by the London Power Co., Ltd., to the Electricity Commissioners for sanction to erect a generating station at Nine Elms, states that the three principal matters which arise are: (1) The liability to nuisance from smoke and coal dust; (2) the possibility of the company sinking wells and diminishing the well-water supply at Nine Elms baths; and (3) the already congested condition of Nine Elms Lane and Battersea Park Road so far as underground mains are concerned. The Committee has approved an agreement with the company giving the Council protection on the three points mentioned. The Committee states that the London County Council, the Westminster City Council, and the Great Western Railway are each dealing with the application so far as their respective interests are involved.

ST. MARYLEBONE.—The Borough Council has been notified that the terms of agreement with the Hampstead Borough Council for bulk supplies of electricity have now been approved by the Electricity Commissioners and the London and Home Counties Joint Electricity Authority.

Application is to be made for sanction to a loan of £27,338 to cover excess expenditure on the Council's plant extension scheme.

Lowestoft.—LOAN.—The Corporation Electricity Committee has received a report from the electrical engineer as to the plant required in connection with the taking of a bulk supply of electricity from Gt. Yarmouth Corporation, and recommends that application be made for sanction to a loan of £30,000, made up as follows:—22,000-V switchgear, £5,500; transformers, £3,000; 6,600-V switchgear, £2,700; converting plant and switchgear, £13,800; d.c. feeder panels, £1,000; alterations to main cables, £400; foundations and alterations to buildings, £3,000; contingencies, £600.

EAST ANGLIAN BILL.—The Corporation Electricity Committee reports that the promoters of the East Anglian Electricity Bill have now omitted the whole of the County of Essex from the Bill, and have agreed to insert therein certain clauses for the protection of authorities who are also authorised to supply electricity in the remaining part of their proposed area. The Corporations of Great Yarmouth, Norwich, and Ipswich have submitted additional clauses intended to exclude the promoters from supplying electricity in areas for which the Corporations hope to obtain powers to supply electricity in future, and to exclude from the scope of the Act the right of the promoters to have the powers of the Central Board delegated to them under the Electricity Supply Act, 1926. These further clauses have not been accepted by the promoters. The Committee is of opinion that so far as the interests of Lowestoft are concerned, the clauses which the company is prepared to insert may be accepted as a fair compromise, and it has accordingly authorised the withdrawal of the Council's opposition to the Bill.

Manchester.—LOAN.—The Corporation Electricity Committee is applying for sanction to the borrowing of £252,500 for services.

Morecambe.—Supply for Housing Estate.—The Corporation Electricity Committee is to supply electricity to the South Grove housing estate at a cost of £1,500 for mains and services.

Railway Supply.—At an Electricity Committee meeting the borough electrical engineer reported correspondence with the railway company with respect to the supply of electricity for the working of its railway between Heysham, Morecambe, and Lancaster. The chairman and electrical engineer have been appointed to enter into an agreement with the railway company for this purpose.

Plymouth.—Electricity Extensions.—Cable extensions, at an estimated cost of £3,268, to a site at St. Budeaux upon which houses are to be erected for Admiralty employés, were authorised by the Electricity Committee on April 26th. The linking up of the cable at Saltash Passage and extensions to ten further streets were also sanctioned.

Portsmouth.—Electricity Extension.—In connection with the proposed bulk supply of electricity to Midhurst, the Corporation Electricity Committee has received an application from the Chichester Corporation that a h.p. cable be laid by the Council from the Fishbourne sub-station to Sennicotts Corner, on the understanding that the Chichester Corporation will pay half of the sinking fund and interest charges on the cost until such time as the cable is continued to Midhurst, and that the 10 per cent. abatement in respect of the Summersdale area on the unit charge will be waived for two years if this is done. As the cable in question forms the first part of the proposed extension to Midhurst, the Committee recommends that the request be complied with, and that a h.p. cable be laid from the Fishbourne station to Sennicotts Corner accordingly.

Loan Sanctioned.—The Committee has received sanction to a loan of £1,693 for the erection of a sub-station in Crown Street.

Prestatyn.—Loan.—The Urban District Council is to borrow an additional £5,000 for electricity extensions. It is anticipated that the Council will be in a position to take electricity from the North Wales Power Co., Ltd., in the course of a few days.

Preston.—Assisted Wiring Scheme.—The Electricity Committee has submitted a report on an assisted wiring scheme to the Council for approval. The report states that there are 70,000 houses in the borough not wired for electricity, which it is estimated would yield an additional revenue of £150,000 if electricity was installed. On the proposal "that the work in connection with the scheme be carried out by the Electricity Department by direct labour or by the employment of contractors," an amendment was moved that this clause be deleted. The chairman of the Electricity Committee stated that it was not prepared to commit itself to direct labour entirely until it had some proof that it was the best thing that the Department should carry out the work. On the vote being taken, the amendment was lost by 18 votes to 13.

Prestwich.—Street Lighting.—The surveyor has submitted to the Urban District Council a comparative statement of the cost of converting the public lamps in the district from gas to electric lighting, and it has been decided to take no action in this connection, but to consider the relative merits of gas and electricity when the question of the provision of additional public lighting facilities is considered.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Edinburgh.—Lighting: From 4¾d. to 3½d. per kWh. Power: From 1.6d. for the first 1,000 kWh per annum and 0.9d. for all energy above 31,000 kWh per annum to 1.4d. and 0.7d., respectively, with a discount of 6 per cent. for all energy over 31,000 kWh for 3-phase supply. Domestic heating: From 1.2d. per kWh for the first 100 kWh per term and 0.825d. beyond, to 1d. and 0.625d., respectively.

Oswestry.—Lighting: From 9½d. to 8d. per kWh.

Bury.—The increases of 10 per cent. for lighting, and 15 per cent. for power, made owing to the coal dispute, have been withdrawn.

Manchester.—To all consumers, except those under special agreement: A reduction of ¼d. per kWh.

Rothesay.—New Power Station.—The plant installed at the Town Council's new power station, which was recently inaugurated, includes a 5-cylinder 250 b.h.p. Mirrlees-Diesel engine, made by Messrs. Mirrlees, Bickerton & Day, Ltd., Stockport. The engine is direct-coupled to a 170-kW Metropolitan-Vickers generator. The consulting engineers for the scheme were Messrs. Stevenson & McGuffie, of Glasgow.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the Spalding Urban District Council authorising it to supply electricity in the rural district of Crowland, and part of the rural district of Peterborough; the Llanelly and District Electric Supply Co., Ltd., to extend its area of electricity supply so as to include the borough of Kidwelly, and parts of the rural districts of Carmarthen, Llandilo Fawr, and Llanelly; and the Crowborough District Gas and Electricity Co., to supply in the parish of Rotherfield.

Stoke-on-Trent.—All-Electric Houses.—At a recent meeting of the Corporation Electricity Supply Committee it was reported that considerable public interest was being taken in the two all-electric houses in Avenue Road, Shelton, and that up to March 30th the number of people who had inspected the houses was estimated at 14,500. The Committee decided to ask the Housing Committee to erect a further 22 all-electric houses in Avenue Road, Hanley, and to allocate 200 houses on the Abbey Hulton housing site as all-electric houses to be wired for lighting, heating, and cooking by, and at the cost of, the Electricity Supply Committee.

Taunton.—Loan.—The Town Council has applied for sanction to a loan of £1,500 for transformers and transformer sub-stations.

Whitburn (Durham).—Street Lighting.—The Parish Council has decided to adopt electric lighting for the streets of Whitburn and Marsden, and has accepted the tender of the Durham County Electrical Power Co., Ltd., for its installation and maintenance.

Tramway and Railway Notes.

Australia.—Melbourne.—The *Industrial Australian and Mining Standard* reports that the Melbourne and Metropolitan Tramways Board has been authorised to raise a further loan of £250,000. Mr. A. Cameron, chairman of the board, explained that the money would be used for tramway conversions and duplications, the construction of new cars and other tramway purposes.

Brighouse.—Purchase of Route.—Negotiations between the Halifax and Bradford Corporations have resulted in the former offering to sell to Bradford the running rights of its tramway from Brighouse to Bailiff Bridge (a little over a mile in length, and joining up with the Bradford system) for £5,000. The Bradford Tramways Committee, on April 27th, decided to recommend the City Council to accept the offer, thus giving Bradford a tramway service through to Brighouse. The Halifax lines are only 3 ft. 6 in. gauge, and if the purchase is made it is likely that the permanent way will be widened to the gauge of the Bradford track, which is 4 ft.

Burnley.—Purchase of Cars Deferred.—The General Purposes Committee has decided to defer consideration of the purchase of five double-deck tramcars until the end of September. It is stated that the Corporation owns 53 double-deck cars and 19 single-deck cars. No additional double-deck cars have been purchased since September, 1912. The passengers carried increased from 16 millions in 1913 to 24 millions in 1926. In the opinion of the Tramways Committee it is necessary to increase the rolling stock to enable the Department to deal with the demands of increasing traffic. The cost of the new cars is £9,800, which the Department proposes to meet out of revenue, spread over five years.

Continental.—Hungary.—The Chamber of Commerce of Miskolcz has submitted to the Hungarian Minister of Commerce a detailed plan for electrifying the Miskolcz-Bánréve railway, Hungary's most important communication with Czecho-Slovakia. It is proposed to erect a power station near the mines of the Sajo Valley.—*Reuter's Trade Service* (Budapest.)

Glasgow.—Garage Equipment.—The Corporation Cleansing Committee has instructed the engineer and manager of the Electricity Department to prepare the specifications, &c., for all the electrical apparatus required in the new garage at Govan in connection with the charging of the batteries of the electric vehicles, &c. The Measurer is to be instructed to arrange that the electric lighting of the garage will be included in the specifications and schedules of quantities to be issued by him for the construction of the building. It was also agreed that the engineer and manager of the Electricity Department should be asked to supervise the construction of the electrical work.

Heywood.—New Route.—The *Manchester Guardian* reports that at a recent meeting of the Town Council it was reported that all the sanctions had now been received for the widening of Middleton Road and the laying of a tramway to connect the Manchester tram service at Middleton with the Heywood service at Hopwood, and so provide a through service from Heywood to Manchester. The cost is estimated at £100,000, and grants will be received from the Ministry of Transport, the Lancashire County Council, and the Unemployment Grants Committee.

Increase of Charges.—The Minister of Transport has made an Order under the Statutory Undertakings (Temporary Increase of Charges) Act, 1918, authorising certain fare changes by the Dundee Corporation Tramway.

Middlesbrough.—Fares.—The Corporation Tramways Committee has approved a scheme by which it will be possible for passengers to take omnibus tickets from the Hartlepools, cross the transporter bridge over the River Tees, and then go on by the Corporation tramway service to a point where other 'buses can be taken.

Telegraph and Telephone Notes.

Bolivia.—MARCONI CONTRACT.—Under a twenty years' Government contract, Marconi's Wireless Telegraph Co. has undertaken the control and operation of the entire postal telegraph and wireless services of Bolivia; the services were taken over on May 1st. This is the second contract of its kind entered into by Marconi's Co. in South America, the first being with the Peruvian Government in 1921. Modern apparatus will be introduced.

France.—NEW RADIO SERVICE.—The official inauguration of direct wireless communication between France and French Equatorial Africa took place on April 29th. The station at Brazzaville is another link in the chain of wireless stations which are being constructed in accordance with the plans of the Government; it will not only be used for the transmission of commercial messages, but will also serve for the dissemination of weather forecasts, time signals, and all information of use to shipping. The construction of the new station was begun in 1920; it will be staffed by nine Frenchmen, aided by natives.—*Reuter.*

Germany.—CHEAPER TELEPHONES.—A reduction of 33⅓ per cent. in the charges for the public telephone service took effect on May 1st, bringing the price down to ten pfennigs (roughly one penny per call). Hitherto it has been fifteen pfennigs, which odd price necessitated all users of public telephones purchasing special disks, slotted and nicked in a special way to deter "coiners," for insertion in the telephone boxes. For the lowered rates new boxes have been introduced which will take the ordinary ten-pfennig pieces.—*Reuter* (Cologne).

Hull.—FOREIGN TELEPHONES.—The Hull Corporation Telephone Committee has accepted a tender for Belgian automatic table telephones and bell sets at a cost of £337; the lowest British tender was £475.

Portugal.—MARCONI "BEAM" STATIONS.—An extension of wireless telegraph facilities took place on April 30th with the inauguration of services between Lisbon and the Portuguese colonies of Cape Verde, Angola, and Mozambique. The opening of these services completes the network of wireless communication which Marconi's Wireless Telegraph Co., Ltd., undertook to construct for the Portuguese Marconi Co. in accordance with the concession obtained from the Portuguese Government in November, 1922. Direct wireless communication is now established between Lisbon and all the principal Portuguese colonies, which also have a complete system of wireless communication with one another. Services to the Portuguese Islands of Madeira and Azores were opened on December 15th last. Direct services between Lisbon and London, Paris, and Berlin have also been opened during the last few months, and a direct service with Rio de Janeiro is expected to be opened almost immediately. The English group of stations with which the Portuguese stations at Lisbon communicate are the Marconi stations at Ongar and Brentwood, in Essex. The transmitters for communication between Portugal and South America, Mozambique, Cape Verde, and Angola are operated on the short-wave "beam" system.

Turkey.—REOPENING OF TELEGRAPH STATIONS.—A convention was signed on May 1st with the Eastern Telegraph Co. organising the opening of the Company's stations at Constantinople and Smyrna for a period of 30 years.—*Reuter* (Constantinople).

Transatlantic Cables.—NEW DIRECT SERVICE.—The Western Union Telegraph Co. announces that on May 10th direct cable-working in each direction will be inaugurated between London and Boston, Mass., U.S.A., over one of the nine Atlantic cables operated by the company.

The cable steamer *Teleonia* recently arrived at Valentia, Kerry, Irish Free State, where she is to undertake some repairs to the transatlantic cable.

Radio Notes.

Australia.—LICENCES.—According to returns prepared by the Postal Department, the number of broadcast receiving licences held throughout the Commonwealth at the end of February was 197,872, which represents 3.2 per cent. of the population. Victoria was first amongst the States with a total of 114,428 licences, compared with 51,154 in New South Wales, 20,425 in Queensland. 15,773 in South Australia, 4,014 in West Australia, and 2,078 in Tasmania. The number of persons per 100 of the population in each State who held receiving licences at the end of February were as follows:—Victoria, 6.1; South Australia, 2.7; Queensland, 2.3; New South Wales, 2.2; West Australia, 1; Tasmania, 1.

Irish Free State.—LICENCE REVENUE.—The fact that in January, February, and March, 1927, the authorities collected £8,315 in licence fees alone is considered by the *Cork Examiner* to be evidence in itself that radio broadcasting in Ireland "is an extremely businesslike proposition."

Licences.—STILL INCREASING.—At the end of March, 1927, the number of Post Office receiving licences current was 2,253,845, an increase of 18,845 as compared with February, 1927, and an increase of 241,845 as compared with May, 1926.

Rhodesia.—NEW STATION.—A broadcasting station to be established in Southern Rhodesia within the next ten months to operate in conjunction with the Johannesburg station, and will relay the evening programmes transmitted therefrom, says *The Times*. The African Broadcasting Co. is applying to the Southern Rhodesian Government for a licence, and is asking for alterations in the existing regulations in order that "pirates" may be dealt with.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the ELECTRICAL REVIEW containing the advertisement is given in parentheses below.

Contracts Open.

Australia.—MELBOURNE.—June 1st. Victorian Government Railways. Electric time-releasing mechanisms. (B.X. 3451.)*

July 5th. State Electricity Commission. One 15,000-kW steam turbo-generator and accessories. (B.X. 3369.)*

July 4th. 66,000-V and 22,000-V insulators for the Yallourn brown coal scheme. (See this issue.)

June 28th. Postmaster-General's Department. Jacks, switchboard instruments, &c. (B.X. 3474.)*

SYDNEY.—June 22nd. New South Wales Government Railways. Remote-control switchgear. (B.X. 3442.)*

June 20th. Municipal Council. Turbo-alternators for Bunnerong power station. (B.X. 3443.)*

BRISBANE.—May 18th. City Electric Light Co., Ltd. Outdoor switchgear. (B.X. 3456.)*

Barking.—May 9th. County of London Electric Supply Co., Ltd. Cables and accessories for the Barking power station. (April 1st.)

Belgium.—May 18th. Service du Matériel des Chemins de Fer Belges, 21, Rue de Louvain, Brussels. Supply of 7,500 metres of insulated cable, 1,550 metres of bare copper wire, 6,000 metres of wire, and 1,000 metres of annealed copper flexible cable for brushes. Particulars (Cahier des Charges Special, No. 50-199-182) for 2½ fr.

May 18th. Belgian Post and Telegraph Authorities at La Salle Madeleine, Brussels. 46,235 metres paper-insulated armoured cable, 48,627 metres ditto, but with outer armouring. Particulars (Cahier des Charges Special No. 3-238) for 14 fr.

Chile.—SANTIAGO.—July 18th. Chilean State Railways. Materials for electric lighting and power (Group 20). Materials for electric lighting of locomotives and coaches (Group 32). August 22nd. Signalling telegraph and telephone supplies (Group 36). (C.X. 2271.)*

Darton.—May 17th. West Riding Education Committee. Electric lighting installation at Darton Kexborough new school. Specifications from Education Department, County Hall, Wakefield.

Darlington.—May 23rd. Electricity Committee. One 500-kW rotary convertor, with transformer. (See this issue.)

Dewsbury.—May 13th. Electricity Committee. Six months' supply of washed smalls required at the electricity works. Mr. R. W. Grubb, borough electrical engineer, Bradford Road.

Dublin.—May 23rd. Electricity Department. Pipework for the 5,000-kW turbo-alternator. (See this issue.)

Dundee.—May 19th. Electricity Department. 2-core and 4-core l.p. cable. D.c. and a.c. house-service meters. (See this issue.)

Edinburgh.—May 16th. East Lothian Education Authority. Works, including electric lighting installation, for the extensions, &c., at Macmerry Public School. Schedules from the surveyors, Messrs. R. & A. K. Smith, 44, Queen Street, Edinburgh.

Egypt.—Cairo.—May 24th. Director-General of Prisons. Twelve months' supply of electric lamps, &c. (C.X. 2268.)*

June 4th. Egyptian State Railways, Telegraphs and Telephones, Chief Inspecting Engineer, Queen Anne's Chambers, S.W. Underground cables (approx. £E12,000 to £E113,000). —*Reuter's Trade Service* (Cairo).

May 28th. Ministry of Education. Electrical equipment for Beni Suef Trades School. (B.X. 3488.)*

Epsom.—Electricity Department. E.h.p. cable. (See this issue.)

Glasgow.—May 18th. Electricity Department. Cables, small i.r. insulated cables and flexibles, meters and carbons for 12 months. (See this issue.)

May 9th. Education Authority. Electric lighting installations in a number of schools. Forms, &c., from Education Offices, 129, Bath Street, Glasgow.

London.—St. Marylebone.—May 18th. Electricity Department. L.p. and e.h.p. cables for 12 months. (April 15th.)

Islington.—June 1st. Electricity Department. Steel-tube lamp columns, 2,200-V feeder switchgear, rotary and/or static power factor correctors. (April 22nd.)

Metropolitan Asylums Board.—May 18th. Installation of a multiple roller ironing machine; new steam boiler, &c.; steam main; electric power in laundry, &c., at Darenth Tramway Colony; conversion of mechanical stokers to hand firing at North-Eastern Fever Hospital. (April 29th.)

London County Council.—May 17th. Electrical installation at the Albion Road, Stoke Newington, Central School (approx. 133 points). (See this issue.)

Manchester.—May 10th. Tramways Committee. Trucks, motors, and controllers for electric tramcars; tramway poles, span-wire brackets, trolley wire, and copper bonds. Steel girder tramway rails. Mr. H. Mattinson, general manager and chief engineer, 55, Piccadilly, Manchester.

14th May. Electricity Committee. Twelve months' supply of cast-iron junction boxes and socket bends, weldless steel lamp columns, fittings, and street lanterns. Mr. H. C. Lamb, chief engineer and manager, Electricity Department, Town Hall.

New Zealand.—Wellington.—June 21st. Public Works Department. Sub-station switchgear and metering equipment for Arapuni. (B.X. 3398.)*

June 7th. Railway sub-station equipment, Lake Coleridge electric power scheme. (B.X. 3295.)*

June 13th. New Zealand Railways. Machine tools, workshop equipment and overhead electric travelling cranes. (A.X. 4344.)*

June 6th. Six electric locomotives. (A.X. 4355.)* Overhead equipment for the Christchurch-Lyttelton electrification scheme. (B.X. 3301.)*

Invercargill.—May 31st. Southland Electric Power Board. Transformers. (B.X. 3379.)*

June 15th. 66,000-V oil circuit breakers. (B.X. 3378.)*

Lyttelton.—July 20th. Harbour Board. Four 5-ton electrically-operated portal cranes, and ten electrically-operated capstans. (A.X. 4352.)*

Auckland.—July 4th. Auckland Electric Power Board. Switchgear. (B.X. 3471.)*

Salford.—May 14th. Public Health Committee. Electrical installation at Drinkwater Park Hospital, Prestwich. Specifications from Medical Officer of Health, 143, Regent Road, Salford.

Sleaford.—May 17th. Electricity Department. Cables, boxes, &c. (April 29th.)

Scarborough.—June 3rd. Corporation. Installation of electrical pumping plant in duplicate for the new Irton water scheme No. 2. Specifications (£5) from Dr. H. Lapworth, engineer, 25, Victoria Street, S.W.

Thorne.—May 17th. West Riding Education Committee. Electric lighting installation at new boys' school. Specifications, &c., from Education Department, County Hall, Wakefield.

Uruguay.—Montevideo.—June 15th. State Electricity Supply Works. 15 transformer sub-station equipments (6,600/220 V, 50 cycles). (B.X. 3371.)* Five overhead transformer sub-stations mounted on tubular or section iron columns. (B.X. 3430.)*

Whitley.—Electricity Department. One 1,000-kW turbo-alternator, with condenser, pumps, air filter, &c.; one 200-kW semi-Diesel or heavy-oil engine alternator. (See this issue.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Bedford.—Electricity Committee.

Feed-water heater and pipe work (£296).—Ledward and Beckett. (Accepted.)

Overhead cable in connection with supply to Ampthill (£4,600).—R. M. Russell. (Recommended.)

Brighton.—Lighting Committee. Accepted:—

Switchgear (£251).—Metropolitan-Vickers Electrical Co., Ltd.

Cheltenham.—Electricity Committee. Accepted:—

Renewing parts of grate stoker (£152).—Babcock & Wilcox, Ltd.

Czecho-Slovakia.—Messrs. Standard Telephones & Cables, Ltd., has received a contract to manufacture and install a 3-kW standard broadcasting radio equipment at Kosice (Kassa).

Erith.—Urban Council. Accepted:—

Cables for a year (£4,361).—Callender's Cable & Construction Co., Ltd.

Glasgow.—Electricity Committee. Recommended:—

Ash tank for boiler house at Dalmarnock power station (£671).—Babcock & Wilcox, Ltd.

Tramways Committee. Accepted:—

Storage battery for power station and sub-stations.—Tudor Accumulator Co., Ltd.

Telephone and test cable.—Hackbridge Cable Co., Ltd.

Special track work.—Thermit, Ltd.; Edgar Allen & Co., Ltd.; and Titan Trackwork Co., Ltd.

Gloucester.—Electricity and Light Railways Committee. Cables, &c., in connection with the supply of electricity to the Gloucester Rural District (approx. £46,945).—British Insulated Cables, Ltd. (Recommended.)

Hull.—The Corporation Telephones Committee has accepted a Belgian tender for automatic table telephones and bell sets at £337. The lowest British tender was £475.

Ilford.—Town Council. Accepted:—

Electricity meters.—Edison Swan Electric Co., Ltd.; Ferranti, Ltd.; R. Hornsby & Co., Ltd.; Landis and Gyr, Ltd.; and Measurement, Ltd.

Lamp Contract.—

Nine months' contract for "Osram" metal-filament and "Robertson" carbon-filament lamps for the Bolsover Colliery Co.—General Electric Co., Ltd.

London.—Battersea.—Electricity Committee. Accepted:—

Insulated glazed platform for switchgear gallery (£160).—British Luxfer Prism Syndicate, Ltd.

Poplar.—Electricity Committee.

Earthing at new power station. Five neutral-point earthing cubicles for machines in old station; 1 limiting resistance for old station; 1 limiting resistance for new station, complete with indicating device to show which machine is earthed:—

Metropolitan-Vickers Electrical Co., Ltd. (Recommended.)	**£546**
General Electric Co., Ltd.	555
Johnson & Phillips, Ltd.	789

Metropolitan Asylums Board.—Hospitals Committee. Recommended:—

X-ray equipment at Northern Hospital (£125).—Newton and Wright, Ltd.

Portsmouth.—Electricity Committee.—The following tenders were received for the installation of coal-handling plant at the power station:—

	Part 1. £	Part 2. £	Total. £
Aldridge & Ranken, Ltd. ...	6,249	6,005	12,254
(Alternative)	6,739	6,444	13,183
Babcock & Wilcox, Ltd. ...	6,579	6,423	13,002
(Alternative). (Recommended.)	**7,037**	**6,423**	**13,460**
Ed. Bennis & Co., Ltd. ...	7,800	6,088	13,888
Fraser & Chalmers Engineering Works	8,269	7,459	15,728
Strachan & Henshaw, Ltd.	—	—	16,350

Cable (£1,038).—Johnson & Phillips, Ltd.

Sheffield.—Electric Supply Committee. Accepted:—

Automatically-operated traction sub-station equipment, comprising one 750-kW convertor, with switchgear and accessories (£4,300).—English Electric Co., Ltd.

Smethwick.—Estates Committee. Accepted:—

Electric pump (£160).—Tangyes, Ltd.

Warrington.—Tramways Committee. Accepted:—

Manganese crossing.—Hadfields, Ltd.

Electricity Committee. Accepted:—

Repairs to 3,000-kW set.—English Electric Co., Ltd.

York.—Education Committee. Recommended:—

Installation of electric lighting at Tang Hall school (£563). —A. E. White, York.

Forthcoming Events.

Junior Institution of Engineers.—Friday, May 6th. 39, Victoria Street, S.W. 7.30 p.m. Ordinary meeting.

Chemical Engineering Group.—Friday, May 6th. Imperial College of Science and Technology, South Kensington, S.W. 6 p.m. Annual general meeting. 8 p.m. "Chemical Fire Extinguishers." Dr. W. R. Ormandy.

Royal Society of Arts.—Monday, May 9th. 8 p.m. Cantor lecture. "The Measurement of Light." Mr. J. W. T. Walsh. (Lecture III).

Wednesday, May 11th. 8 p.m. "English Railways." Prof. W. E. Dalby, F.R.S.

Institution of Electrical Engineers (Western Centre).—Monday, May 9th. Plymouth. Summer meeting.

Institution of Civil Engineers.—Tuesday, May 10th. London. 6 p.m. Annual general meeting.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, May 14th. South Wales Institute of Engineers, Cardiff. 6 p.m. Annual meeting.

The "Electrical Review" Service Department.

Inquiries must be accompanied by a stamped addressed envelope.

We should be glad to learn the name and address of makers of the following:—

Daycolite fittings.

Notes.

Extensions at Aldershot.

On April 25th a ceremony at Farnborough took the form of the laying of a foundation corner stone, by Councillor T. Cochrane, chairman of the No. 11 District Joint Industrial Council for the Electricity Supply Industry, for the future extensions of the North Camp and Farnborough Works of the Aldershot Gas, Water and District Lighting Co. With the advent of an Extension of Area Order now emerging it is estimated that the electricity output of the company for 1931 will be 3 million units, and for 1933, 5 millions. The policy of the undertaking with regard to the generation of electricity has been to link up the various primary departments. The company has two large works, one at North Camp, occupying an area of 30 acres, and another at Ash Road, Aldershot, covering 46 acres. The former site has certain peculiar advantages in favour of the installation of a large generating station. The main railway line between Dover and the North runs through the works, and the River Blackwater forms a boundary of the site. Further, it is in a favourable position geographically for linking up with other districts, such as Ascot, Guildford, and Winchester.

At the ceremony the chairman of the company, Mr. R. W. Edwards, compared the charges which the company was to introduce from the Midsummer quarter, with those prevailing in the London and Home Counties Electricity District, where the average lighting, power, and heating and cooking rates were 6.75d., 2.81d. and 2.07d. per kWh, respectively. The minimum Aldershot charge would be 1.875d. per kWh. He pointed out that the load factor of the station compared very favourably with those of some of the largest undertakings. The highest weekly load factor for 1925 was 48.0 per cent., and for 1926, 42.9 per cent. This was attributable to the unity of working between the various departments of the company.

The Electrical Trades Benevolent Institution.

The annual general meeting of the E.T.B.I. was held on Thursday last week, with Dr. W. H. Eccles, president I.E.E., in the chair. The report of the Committee of Management for the year 1926 showed that the income from contributions was £7,415, making with the receipts from dividends and other sources the total income of £8,651. An amount of £7,219 had been carried to capital account after the payment of grants and expenses. In respect of the year the sum of £1,571 had been invested, bringing the total of invested funds to £26,176 at cost. The necessity of the Institution was more strongly demonstrated than in any previous year, the number of grants having been 75, amounting to £1,105, compared with 81, amounting to £934, in 1925. Every qualified applicant received assistance.

The activities of the Local Advisory Committees had continued to be of great benefit, not only in increasing the contributions, but also in enabling persons requiring assistance to know that it could be obtained from the Institution. The Committee hoped that further committees of this kind would be created, and invited the co-operation of leading persons in large towns. There were such committees in Cardiff, Manchester, Newcastle-on-Tyne, and Glasgow.

The annual festival, held on November 10th, 1926, was presided over by Sir Hugo Hirst, Bart., president of the Institution. Thanks to the extraordinary efforts made by the president, his appeal resulted in the collection of £6,912.

Commenting on the report and accounts, the chairman pointed out that the income for the year was £8,651, compared with £3,128 in 1925. The income resulting from the annual festival exceeded the largest amount previously collected at a festival; the previous best was that which was collected in 1914, and the chair on both occasions was occupied by Sir Hugo Hirst, as president. The contributions resulting from the efforts of the Newcastle Local Committee were almost double those collected in the previous year. The thanks of the Institution must be given to them and to the committee of the Engineers' Ball, and to the executors of the late Mr. A. P. Lundberg who, acting on what they thought would be his desire, generously gave a contribution of £50. The dividends on investments for 1926 were £1,234, compared with £1,175 in the previous year. The total administration expenditure amounted to £296, as compared with £299 in the previous year. Since the end of 1926 £5,261 had been invested.

The report and accounts were adopted, and new rules prepared by a special sub-committee and carefully considered by the Committee of Management were adopted in place of the existing rules; they have to be confirmed at a subsequent general meeting. Reference was made to the death of Captain R. J. Wallis-Jones, who was one of the most energetic members of the Committee.

The Committee of Management was elected, and was empowered to constitute the Council under the new rules if, and when, the new rules were confirmed.

Educational.

A special course of six lectures on "Electrical Engineering Economics," by Mr. D. J. Bolton, B.Sc., will be held at the Regent Street Polytechnic, London, on Thursdays commencing May 12th (excepting June 9th), from 6.30 to 8.30 p.m. The course is intended for electrical students who wish to gain an insight into the economic calculations upon which so many engineering decisions depend. The fee for the course to students residing or employed within the administrative county of London, or residing in Middlesex or Kent, is 7s. 6d.

A Scottish Power Consumers' Association.

It has been decided to form an Ayrshire Electric Power Consumers' Association, and a meeting will be held on May 12th to adopt a constitution and rules. The objects of the Association are to advise members on matters relating to the use and application of electrical energy, to protect the interests of members in respect of cost and conditions of supply, and generally to safeguard and promote the interests of the members as consumers. All consumers, other than for domestic purposes, are eligible for membership. The secretary is Mr. J. D. Wyllie, solicitor, 37, Bank Street, Kilmarnock.

B.E.S.A. Publications.

Two British Standard Specifications for Instrument Transformers (No. 81, 1927), and Graphic (Recording or Chart-Recording) Ammeters, Voltmeters and Wattmeters (No. 90, 1927), have recently been issued by the British Engineering Standards Association. These are revisions of the 1919 editions, and have been brought into line with other B.S.S.'s for electrical instruments, there now being a series of four up-to-date specifications: Indicating Instruments, No. 89; Graphic (Recording) Instruments, No. 90; Electrical Protective Relays, No. 142; Instrument Transformers, No. 81.

No. 81 deals with the testing of current and voltage transformers, the rated secondary current or voltage, ratios of transformation, limits of temperature rise and the rated burdens. Each type of transformer is graded into four classes, according to the use to which the transformer will be put, and the limits of error for each class are laid down. A useful series of appendices are included, dealing with such matters as the conditions affecting the construction and use of transformers, terminal markings, notes on the selection of current transformers, the limitations of single-turn current transformers, and the method of measuring temperature rise.

Publication No. 90 is in effect a sister specification to B.S.S. No. 89, special attention being devoted to the driving mechanism and to the effect of the pen-to-paper friction. Chart speeds and chart rulings are also dealt with, as are also the limits of error and the methods of testing for accuracy. The allowances to be made for the effect of external magnetic fields, changes in frequency, power factor, and the amount of ink, &c., are specified. Appendices are included, dealing with notes on the accuracy of different types of instrument, charts and driving mechanism, terminal markings, and so on.

Copies of the revised specifications may be obtained from the Publications Department, British Engineering Standards Association, 28, Victoria Street, London, S.W.1, price 2s. 2d. each, post free.

Appointments Vacant.

Assistant master in electrical engineering, for the Rugby Technical School. Charge engineer for the City of Stoke Electricity Department. Canvasser (£257) for the Hammersmith Borough Council Electricity Department. Telephone inspector (£300) for the Government of British Guiana Post Office Department. Assistant district engineer (approx. £630) and assistant installation engineer (approx. £490) for the Municipal Commissioners of Singapore Electricity Department. (See our advertisement pages to-day.)

Irish Free State Electricity Supply.

The Irish Free State Government's Electricity Supply Bill last week passed its final stage in the Dail by 36 votes to 17, and now awaits consideration by the Senate. It is expected that the Bill will be passed into law this month, but various urgent appeals have been made to the Senate to exercise its constitutional powers to hold it up pending the result of the Dail General Election in June. The Government's position is held to be precarious, and should it not return to power the part of the scheme which aims at consolidating the distribution of electrical power in the State might be abandoned. In the Dail, Mr. Johnson, leader of the Labour group, said the Bill's main defect was the absence of any Parliamentary supervision. The refusal of the Minister for Industry and Commerce to make any concession on any vital point has aroused fresh indignation. He would not even agree that the members of the Board should be experts in electricity management. Major Bryan Cooper remarked that the position was that the Board of Control was to be given a blank cheque with power to do as it liked.

At a meeting of Rathmines Urban Council, Sir S. Maddock, chairman, alluded to the confiscatory powers of the Bill, dwelling on the claim that the town's electricity undertaking had been developed by the ratepayers' money, and that they now had a substantial yearly surplus from it. They had no assurance that under the Government Bill the town would be as well served.

Mr. A. R. Monks, chairman of the Cork Electric Tramway and Electric Lighting Co., at the annual meeting, said that the future of the company was uncertain in view of the Government's Bill.

The Minister for Industry and Commerce having given his sanction to the raising of a loan of £150,000 by the Dublin City Administrative Commissioners for work in connection with the city's electricity concern, the Commissioners have decided to create redeemable stock, and an issue will be made accordingly.

Artificial Sunlight.

"Sunlight baths," by the use of mercury-vapour lamps recently installed at the Bradford Corporation Central Baths, were opened to the public on April 25th. The first installation, for which four dressing cubicles have been set aside, has cost £200 and is for gentlemen only, but the treatment will shortly be available for ladies also. The bath periods vary from one to ten minutes, and an electrical timekeeper is being installed to ensure against overdose. It is anticipated that a future development may be the installation of sunlight lamps over the big swimming bath.

University of London.

On Tuesday next, May 10th, graduates in science of the University of London, who are members of Convocation, will elect three graduates to fill vacancies among the five Convocation members of the Senate who represent Science. None of the Science representatives hitherto has been an engineer in practice, though many engineers have graduated in Science at the University, and it is very desirable that the special needs of the engineering profession should be adequately put before the Senate; we are very glad, therefore, to learn that Mr. Roger T. Smith, B.Sc., M.Inst.C.E., Past-president of the Institution of Electrical Engineers, and partner in the firm of Highfield and Roger Smith, consulting engineers, Westminster, is a candidate for one of the vacancies, and we venture to urge all engineers who are science graduates and members of Convocation to help to secure representation on the Senate by voting for him. Mr. Roger Smith, who is an official candidate of the XXth Century Society of London Graduates, has held many public appointments in connection with scientific and engineering movements, both national and international in scope, and has made a special study of educational problems relating to the profession of engineering, the development of pure and applied science, and the advancement of research; he is backed by an imposing list of nominators and supporters, including Professor W. E. Dalby, Dr. W. H. Eccles, Prof. J. A. Fleming, Sir T. Gregory Foster, Sir Oliver Lodge, and Dr. W. C. Unwin. The matter is of importance in view of impending changes in the Constitution of the University, and we hope that readers who are voters will do their utmost to ensure the election of so efficient a representative of science and engineering.

Works Visit.

Arrangements have been made for the Birmingham Electric Club to visit the works of the English Electric Co., Ltd., and the Siemens & English Electric Lamp Co., Ltd., at Preston, on May 20th. Reserved saloon accommodation will be provided from New Street Station, Birmingham, 9.10 a.m. Members wishing to take part in the visit should communicate immediately with the Hon. Soc. Secretary, Mr. F. W. Martin.

Institution Notes.

Institution of Electrical Engineers.

North-Eastern Centre.—The report of the Committee presented at the annual meeting at Newcastle-upon-Tyne on April 25th shows that nine ordinary meetings, two informal meetings, and a Faraday Lecture (on two occasions) were held, the average attendance being 74, as compared with 88 in 1925-26. Over 500 persons attended at the November Faraday Lecture, and so many were unable to obtain admittance that Dr. Thornton repeated the lecture in January. The membership of the Centre decreased by 12 to 510. The Tees-side Sub-Centre membership is approximately 20 per cent. of the total, and the Committee notes with regret the falling-off in the membership of the Students' Section. It is hoped that the proposed amendments of the membership regulations now under consideration by the Council of the Institution will remove some of the difficulties which have led to complaints from Students and Graduates. Negotiations are in hand for the establishment of a library, which will be housed in the Armstrong College Library. Detailed particulars will be issued shortly to members. The committee for the next session is as follows:—*Chairman*: Hugh Paterson; *vice-chairmen*: E. Fawssett and P. F. Allan; *hon. secretary*: H. B. Poynder; *new members of committee*: W. T. Maccall, L. E. Mold, H. L. Riseley, B. A. Robinson, and F. H. Williams.

Mersey and North Wales (Liverpool) Centre.—The Committee for the 1927-28 session is as follows:—*Chairman*: Prof. F. J. Teago; *vice-chairmen*: S. E. Britton and Prof. E. W. Marchant; *hon. secretary and treasurer*: Oscar C. Waygood; *new ordinary members of committee*: H. C. Hazel, W. M. Horsfall, F. V. L. Mathias, and J. L. F. Vogel.

Scottish Centre.—On April 12th a paper on "The Application of Machinery at the Coal Face," by Mr. Sam Mavor, was, owing to his absence in London, read by his nephew, Major J. B. Mavor. There was a good attendance of members, and representatives of the Association of Colliery Managers, the Mining Institute of Scotland, the West of Scotland Iron and Steel Institute, and the Institution of Mining Electrical Engineers were also present, and a discussion ensued. The following office bearers for the 1927-28 session were duly elected:—*Chairman*: D. M. Macleod; *vice-chairmen*: G. Morgan and E. Seddon; *hon. secretary*: Joseph Taylor; *asst. hon. secretary*: H. V. Henniker; *committee*: Prof. F. G. Baily, F. H. Whysall, J. Macdonald, N. C. Bridge, H. W. Bewsher, Prof. S. Parker Smith, A. S. McWhirter, R. B. Mitchell, J. C. Macfarlane, J. K. Murray, D. S. Munro, J. M. Scott-Maxwell, and F. Frain, P. Philip, and R. K. Robertson (representatives of the Dundee Sub-Centre).

Excursion.—On Saturday, April 30th, members took part in an excursion by road to Dunkeld, where luncheon and tea were served in the Atholl Arms Hotel, the party returning to Dundee *via* Perth and the Carse of Gowrie. A large number of members and friends, including ladies, took part, the excursion being greatly enjoyed by all.

The Institute of Fuel.

A joint meeting of the vice-presidents and members of the Councils of the Institution of Fuel Technology and the Institution of Fuel Economy Engineers was held under the chairmanship of Sir Alfred Mond on Friday, April 29th. As president of both Institutions, in November last, Sir Alfred Mond, having found a general desire both amongst those most closely associated with the problems of fuel economy and amongst those throughout the country who had a general interest in the question, that the two existing Institutions should be merged into one, suggested terms of fusion. The following terms of fusion were subsequently accepted by the Councils of both Institutions:—

(1) That the name of the merged Institutions be "The Institute of Fuel."

(2) That the Councils of both Institutions as constituted at present be merged and form the Council of the "Institute of Fuel," and that in the autumn following the inauguration of the Institute of Fuel, a new Council shall be elected by ballot of the members of the Institute.

(3) That the present honorary secretaries of each present Institution be joint honorary secretaries of "The Institute of Fuel."

At the meeting the final steps for the fusion of the existing Institutions and the inauguration of the "Institute of Fuel" were taken. Sir Alfred Mond expressed his great gratification that the fusion had been successfully accomplished, and thanked the vice-presidents, chairmen, and members of the Councils of both Institutions for their co-operation in bringing about the present happy result.

Junior Institution of Engineers.

In a paper entitled "The Design and Balancing of 3-phase Low-Tension Systems," read before the Institution on April 29th, Mr. W. Fordham Cooper, B.Sc., put forward some theories for the design of cable networks in developing areas. He said that the deliberations recorded in his paper arose from his experiences during the last six months, when the heating load on the system with which he was concerned was increasing at an alarming rate. He had tried to find some definite basis on which to go forward, a basis which,

although obtained from theories deduced from past experience, would be better than mere rule of thumb. Mr. Cooper set out in detail particulars and calculations relating to the theories that he advanced; he said that many of the results which were given were admittedly tentative and awaited confirmation by experience.

Mr. E. Ambrose, in the discussion, criticised Mr. Cooper's use of theoretical formulæ. He said that mains engineers had a fund of collected knowledge and experience which constantly progressed and served a more useful purpose than sets of formulæ which periodically had to be changed.

Institute of Transport.

The sixth Congress of the above Institute is to be held at Birmingham from May 19th to 21st. The president, Mr. R. H. Selbie, C.B.E., will receive members and visitors in the Warwick and Dudley Rooms, Queen's Hotel, from 7 to 10 p.m. on Wednesday, May 18th. The proceedings will include the reading and discussion of papers, and visits to works, &c. The papers to be read will include "Traffic Control," by Mr. J. H. Follows, C.B.E., L.M.S. Railway, and "Transport in England—A Brief Historical Survey," by Principal C. Grant Robertson, Birmingham University.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.

Mr. Johnstone Wright, M.I.E.E., electrical engineer and general manager of the Belfast electricity undertaking, has been offered and has accepted an important appointment under the Electricity Commission of Great Britain.

Mr. V. Delebecque, who ceases to be general manager of Electric Fans, Ltd., from to-morrow, May 7th, asks for correspondence to be addressed to him at 26a, St. Peter's Square, Hammersmith.

At the annual dinner of the Bradford Engineering Society, held on April 29th, Alderman J. W. Longley, deputy chairman of the Bradford Corporation Electricity Committee, was presented with a clock, with Westminster chimes, in appreciation of his services to the Engineering Society.

On leaving Glasgow to take up an important appointment on the engineering staff of the Central Electricity Board in London, Mr. C. W. Marshall received a presentation from the officials and staff of the Glasgow Corporation Electricity Department at a dinner given in his honour on April 28th, at which Mr. R. B. Mitchell, engineer and manager, presided. Mr. Mitchell, in making the presentation, complimented Mr. Marshall on his loyal and efficient service with the Electricity Department, and congratulated him on securing the appointment.

The Glasgow Corporation Electricity Committee has appointed Mr. Alexander P. McKim, laboratory assistant, to the position of chief technical assistant rendered vacant by the departure of Mr. C. W. Marshall.

Reuter's correspondent at Wellington states that Mr. A. Gibbs, chief telegraph engineer of the New Zealand Postal Telegraph Department, is leaving on a world tour to investigate developments in wireless broadcasting, telegraphic and telephone services. He will also represent New Zealand at the International Radio-Telegraph Conference at Washington in October.

Mr. E. E. Hoadley, M.I.E.E., borough electrical engineer at Maidstone, and Mrs. Hoadley, celebrated their silver wedding on April 29th.

Mr. F. Fernie has recently joined the staff of Messrs. Watsham's, Ltd., Windsor House, Victoria Street, S.W.1, electrical contractors for cable and overhead line work.

Bedford Corporation Electricity Committee reports that under the unit system the salary of the borough electrical engineer will now be £1,060 per annum.

Many distinguished electrical and other gentlemen were present at the Savoy Hotel on Wednesday night last week, when the directors of the Charing Cross Electricity Supply Co., Ltd., gave a dinner to Mr. John M. Gatti, the new chairman of the London County Council.

Mr. F. W. H. Wheadon, M.I.E.E., engineer and manager of the Adelaide Electric Supply Co., Ltd., has been elected to a seat on the board with the title of managing director.

Mr. Clifford Mitchell, late works manager to Marconi's Wireless Telegraph Co., Ltd., of Chelmsford, has been appointed general works manager of the Crittall Manufacturing Co., Ltd., of the same town.

Mr. Oswald G. Cook, who was for some years with the Morecambe Corporation Electricity Department, and later under the War Department, was one of six selected applicants (out of over 400) to appear before the Committee for the post of engineer to the Hendon Union Redhill Hospital.

In our last issue we erroneously stated that Alderman W. T. Dagnall had been elected chairman of the South-East Lancashire Electricity Advisory Board in succession to Alderman W. Walker. Ald. Dagnall was *re-elected* to the position, which he has held since the formation of the Board.

Mr. Treece, who has been works manager of Messrs. Electricars, Ltd., of Birmingham, for the past six years, has been appointed general manager. In future his time will be divided between London and Birmingham.

On Monday last Mr. L. W. Oliver, mains superintendent, Aylesbury Electricity Undertaking, was presented with a silver cigarette case by Mr. Turnbull, the chief engineer, on behalf of the staff, upon leaving to take up an appointment with the British Electric Transformer Co., Ltd. He joined the Aylesbury undertaking as an apprentice in 1915.

Mr. H. G. Baker has relinquished his position as London sales manager of Messrs. Falk, Stadelmann & Co., Ltd., after 18 years' service. He will operate on his own account as a wholesale distributor of electrical accessories at 56, Millman Street, London, W.C.1, for the present.

Mr. Sidney Green, for many years with the St. James's and Pall Mall Electric Light Co., Ltd., and the Central Electric Supply Co., Ltd., has been transferred to the London Power Co., Ltd., on the engineer-in-chief's staff, as stores superintendent and buyer. He took up his duties at Horseferry Road, S.W.1, on May 2nd.

Obituary.—Mr. W. E. Wimhurst.—The death occurred on April 24th, at Dawlish, at the age of 59 years, of Mr. W. E. Wimhurst, who was for 32 years with Callender's Cable and Construction, Ltd., of Erith, and at his retirement was cashier at the Belvedere factory.

Viscount Cowdray.—We regret to record the death of Viscount Cowdray, which occurred on Sunday morning last at the age of 70 years. As head of the firm of S. Pearson and Son, public works contractors, he was responsible for the construction of some of London's underground tube railways.

Mr. A. Campbell.—*The Times* records the death, which occurred at Felbridge, East Grinstead, on April 30th, in his 78th year, of Mr. Archibald Campbell, "late M.I.E.E."

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

J. Roberts, Sons & Eccles, Ltd.—Private company. Registered April 13th, in Belfast. Capital, £2,000 in £1 shares. To carry on the business of engineers, importers and manufacturers of and dealers in auto-electrical accessories, &c. The first directors are:—J. W. Roberts, 9, Grove Terrace, Belfast, electrical engineer; Mrs. R. A. Roberts, 9, Grove Terrace, Belfast; C. E. Eccles, 1, Victoria Crescent, Sydenham, Belfast, secretary. Qualification, 10 shares. Secretary: C. E. Eccles. Registered office: 12-14, York Lane, Belfast.

D. A. R., Ltd.—Private company. Registered April 25th. Capital, £100 in 1s. shares. Objects: To carry on the business of manufacturers, merchants, and distributors of the preparation called Dar, used for desulphating and prevention of sulphation in electric storage batteries; to open service stations, to act as merchants, distributors, &c. The first directors are:—A. E. Whitelaw, Park Lane Hotel, Piccadilly, W., soap merchant; G. R. Whitelaw (same address), sales manager. Qualification, one share. Remuneration as fixed by the company. Secretary: W. F. Sanders. Registered office: Australia House, Strand, W.C.2.

D. X. Coils, Ltd.—Private company. Registered April 29th. Capital, £250 in 1,000 ordinary shares of 1s. each and 200 6 per cent. (free of income tax) preference shares of £1

each. Objects: To carry on the business of a manufacturing, contracting, commercial, promoting, financial, developing and producing association, especially wireless components, &c. The first directors are:—J. H. Nichols, 102, King Edward Road, E.8; G. Nichols, Rye House, Highams Park, E.4 Registered office, 4 and 5, Glebe Road, Kingsland Road, E.8.

Official Returns of Electrical Companies.

Attaix, Ltd.—Debenture dated March 30th, 1927, to secure all moneys not exceeding £500, for which the holder (S. Rogers, 4, Rotunda Terrace, Montpelier, Cheltenham) may become liable by virtue of a guarantee given to the company's bankers, charged on the company's property, present and future, including uncalled capital, but excluding 106, High Street, Southampton. Also debenture of same date to secure all moneys not exceeding £800 for which the holder (H. Burger, South-Western Hotel, Southampton) may become liable by virtue of a guarantee given to the company's bankers. Property charged: as above.

Tungstalite, Ltd.—Capital, £3,000 in £1 shares. Return dated April 11th, 1927. All shares taken up. £2,700 paid. £300 considered as paid. Mortgages and charges, nil.

Coley & Swinnerton, Ltd.—Capital, £2,000 in £1 shares. Return dated December 31st, 1926 (filed March 2nd, 1927). 1,001 shares taken up. £1,001 paid. Mortgages and charges, nil.

Radio Supply Co., Ltd.—Capital, £1,000 in £1 shares. Return dated December 30th, 1926. 599 shares taken up. £599 considered as paid. Mortgages and charges, nil.

E. Shipton & Co., Ltd.—Capital, £6,000 in 4,000 preference and 2,000 ordinary shares of £1 each. Return dated October 22nd, 1926 (filed January 1st, 1927). All shares taken up. £300 paid. £5,700 considered as paid. Mortgages and charges, nil.

National Electric Lamp Co., Ltd.—Capital, £100 in £1 shares. Return dated November 19th (filed December 15th), 1926. All shares taken up. £100 paid. Mortgages and charges, nil.

H. E. C. Electric Co., Ltd.—Capital, £1,000 in 400 preference and 600 ordinary shares of £1 each. Return dated December 30th, 1926. 170 preference and 202 ordinary shares taken up. £172 paid on 170 preference and 2 ordinary shares. £200 considered as paid on 200 ordinary shares. Mortgages and charges, nil.

Embleton & Barker, Ltd.—Capital, £1,000 in £1 shares. Return dated October 26th, 1926 (filed March 2nd, 1927). All shares taken up. £500 paid. £500 considered as paid. Mortgages and charges, nil.

Rubon, Ltd.—Capital, £100 in £1 shares. Return dated December 31st, 1926. 2 shares taken up. Nil called up. Mortgages and charges, £500.

Rhayader Electric Light and Power Co., Ltd.—Capital, £2,000 in £5 shares. Return dated November 4th, 1926. All shares taken up. £2,000 paid. Mortgages and charges, nil.

Kye, Ltd.—Capital, £12,000 in £1 shares. Return dated November 30th, 1926 (filed January 27th, 1927). 11,307 shares taken up. £11,307 paid. Mortgages and charges, nil.

Electrical Importers (Hull), Ltd.—Capital, £205 in £1 shares. Return dated December 9th, 1926. 4 shares taken up. £4 paid. Mortgages and charges, £1,000.

Auto Welding and Engineering Co., Ltd.—C. W. Foster, of 100, Finchley Road, N.W.3, was appointed receiver and manager on April 20th, 1927, under powers contained in debentures dated April 24th, 1923.

Radio Communication Co., Ltd.—Satisfaction to the extent of £5,500 on April 21st, 1927, of debenture dated April 14th, 1926, securing £81,500 (£15,000 outstanding).

International Electrolytic Plant Co., Ltd.—Mortgage dated March 31st, 1927, to secure £500 further advances and costs and all moneys for which the mortgagee may become liable by virtue of guarantees up to £1,200 given to the company's bankers, charged on a debt of about £9,517, owing to the company from Société des Engrais Azotes et Composes, Paris. Holder:—H. Rowlands, 41, Temple Row, Birmingham.

Skegness Electricity Supply Co., Ltd.—Issue on March 18th, 1927, of £50 debentures, part of a series already registered.

Lissen, Ltd.—Capital, £3,000 in £1 shares. Return dated December 31st, 1926 (filed April 12th, 1927). 502 shares taken up. £502 paid. Mortgages and charges, nil.

J. Churley Cann, Ltd.—Debenture dated April 7th, 1927, to secure £3,700, charged on company's property, present and future, including uncalled capital. Holder:—A. C. Sufforn, Hill Head, Fareham, Hants.

C. Shardlow & Co., Ltd.—F. Dixon, of National Chambers, 4, Horsefair Street, Leicester, ceased to act as receiver on April 11th, 1927.

Ledger, Taylor & Co., Ltd.—A. T. Winter, of 7, Bridgegate, Retford, I.A.A., was appointed receiver on April 12th, 1927, under powers contained in debenture dated March 11th, 1925.

Samestophone, Ltd. — A. W. Watson, incorporated accountant, of 5, Waterloo Street, Birmingham, was appointed receiver and manager on April 13th, 1927, under powers contained in certain debentures dated January 20th, 1926.

B. N. B. Wireless, Ltd.—Satisfaction in full on March 7th, 1927, of second debentures dated November 22nd, 1923, securing £100.

Horley and District Electricity Supply Co., Ltd.—Mortgage on freehold land and buildings in Victoria Road, Horley, Surrey, dated April 1st, 1927, to secure £1,500. Holder: C. G. Selfe, Massetts Road, Horley, Surrey.

Alpha Electric Welding Co., Ltd.—Debenture dated April 8th, 1927, to secure £2,000, constituting a specific charge on land at Newport, Mon., and all other freehold and leasehold property of the company and a floating charge on the company's undertaking and property, present and future, including uncalled capital. Holders: Branch Nominees, Ltd., 15, Bishopsgate, E.C.2.

Hellyar & Sons, Ltd.—J. M. Moore, of 15, New Street, Bishopsgate, E.C.1, ceased to act as receiver or manager on March 25th, 1927.

Gillespie Valve Manufacturing Co., Ltd.—Capital £200 in 1s. shares. Return dated January 18th, 1927. All shares taken up. £100 2s. paid, £99 18s. considered as paid. Mortgages and charges, nil.

Cecil Hodges & Co. (Overseas), Ltd.—Capital, £1,000 in £1 shares. Return dated September 15th, 1926 (filed January 1st, 1927). 11 shares taken up. £11 paid. Mortgages and charges, nil.

Allerton Electrical Supplies, Ltd.—Capital, £2,000 in £1 shares. Return dated December 31st, 1926. 1,500 shares taken up. £1,500 paid. Mortgages and charges, £1,400.

Waltham Radio, Ltd.—Capital, £1,000 in £1 shares. Return dated February 17th, 1927. All shares taken up. £1,000 considered as paid. Mortgages and charges: £500 debenture.

Stevenage Electric Light and Power Co., Ltd.—Capital, £16,000 in £1 shares. Return dated March 15th, 1927. All shares taken up. £16,000 paid. Mortgages and charges, nil.

Robson, Paling & Co., Ltd.—Capital, £2,000 in £1 shares. Return dated October 27th (filed November 15th), 1926. 1,380 shares taken up. £600 paid, £780 considered as paid. Mortgages and charges, nil.

Prince's Electrical Clocks, Ltd.—Capital, £3,000 in £1 shares. Return dated December 16th, 1926. All shares taken up. £1,000 paid, £2,000 considered as paid. Mortgages and charges, nil.

E. H. Maisner & Co., Ltd.—Capital, £1,000 in £1 shares. Return dated April 5th, 1927. 490 shares taken up. £490 paid. Mortgages and charges, nil.

City Notes.

Electric Supply Corporation, Ltd.

The annual meeting was held last week, Mr. J. G. B. Stone (chairman) presiding. Introducing the report (*vide* Electrical Review, April 22nd, p. 651), the chairman said that although there was an increase in gross earnings during 1926 the profits, which included dividends on investments, were reduced. The only increase made in the charges was in the case of contracts embodying a scale varying with the cost of coal. The lighting rates were not only not increased, but in some cases were actually reduced. In the smaller towns they were charging the maximum rates authorised by the Orders. Their costs had risen by over £8,000, but the adoption of Diesel engines in certain of their stations saved them from the full effects of the enhanced cost of coal. Generally speaking, the coal stoppage cost them £10,000, of which £6,000 was recovered from the large industrial contracts. Their holding in the Hendon Company was increased by 9,253 bonus shares. The Dumbarton Burgh and County Tramways Co. was passing through a bad period owing to bad trade and unrestricted competition. The North Berwick Company had been purchased by the local authority, and they had received a considerable premium upon their shares. The Hendon and Dawlish Companies were both doing well. The Dalkeith undertaking had been taken out of the accounts. Referring

to the development account, Mr. Stone said that in order to replace those undertakings which had been purchased, or which might be purchased, by local authorities the board had decided to extend the field of operations. Mr. K. A. Scott-Moncrieff (managing director) seconded the motion, and made reference to the Electricity (Supply) Act, 1926, and said that if the scheme matured the company would obtain its electricity in bulk and would be relieved of the responsibility of generating plant. The report and accounts were adopted, and subsequently a resolution was passed for the creation of 500,000 £1 shares, raising the authorised capital to £500,000.

South Wales Power Co., Ltd.

Presiding at the annual meeting on April 26th, the chairman (Mr. W. North Lewis) reminded the shareholders that the company held the bulk of the capital of the South Wales Electric Power Distribution Co. (the Parliamentary Company) and proceeded to refer to the working of the latter company during 1926 (*vide* ELECTRICAL REVIEW, April 22nd, p. 650). He said that the actual output, in spite of the coal stoppage, had only fallen by 14 per cent., but, naturally, generating costs were high. At the commencement of the dispute they had large stocks which obviated the purchase of dear and inferior coal for several months. He claimed that the company had demonstrated its importance in the industrial life of the area. Although South Wales industry was recovering very slowly, the company's output showed a further record; if the rate was maintained there was every reason to hope that it would be possible to pay an ordinary dividend for the current year. The company's plant had been kept up-to-date. They had advanced from 1,500-kW sets to capacities of 16,000 and 18,750 kW, and they hoped during the next few months to place an order for a 25,000-kW set. At the same time their steam plant had been improved, and they were now working with high-pressure, high-temperature boilers with a capacity of 60,000 lb. per hour. That afternoon the Earl of Plymouth was to open the extensions to the power station which had been proceeding for the past four years. The directors intended to continue the improvement and in preparation were asking for an increase in the authorised capital from £850,000 to £1,100,000 and the conversion of certain ordinary shares into ordinary stock. Mr. Lewis said that now that the Electricity Act was on the Statute Book they would do their best to make it a success; they had confidence in the *personnel* of the Electricity Board.

The report and accounts were adopted, and at an extraordinary general meeting which followed the authorised capital was increased.

Indo-European Telegraph Co., Ltd.

In presenting the report for 1926 at the annual meeting on April 28th, Mr. H. L. M. Tritton (chairman), after referring to the successful working during the year, dealt with the question of radio-telegraphy. He said that, although remarkable use had been made of the discoveries in radio transmission, he was convinced that as the telegraphing habit grew, there would still be room for both wired and wireless communication, and, in his opinion, the cable and land-line companies would continue to hold their own. The company had introduced a number of special services which were much appreciated by the public. The difficulties attending the re-opening of the Black Sea cable had not yet been overcome, although no stone had been left unturned to restore direct communication between Odessa and Constantinople. Negotiations had been proceeding with the Turkish authorities, but had not yet reached finality; it was feared, also, that difficulty would be experienced in repairing the fault in the cable. In December last he (the chairman) paid a visit to Moscow, and interviewed the heads of the Russian Government telegraph and telephone services; he was courteously received, and hoped that his visit would prove of mutual benefit. He also went to the company's Odessa headquarters and met members of the British and Russian staffs. The chairman then reviewed the financial results, which were summarised in our last issue (p. 690), and the report and accounts were adopted.

Mexican Light and Power Co., Ltd.

Particulars have been published of a scheme for dealing with the arrears of bond interest and preference dividends. With regard to the 5 per cent. second mortgage bonds, the interest on which is about £750,000 in arrears, it is proposed to allot £7 10s. in cash for each £100 bond and £50 par value of bonds of the same issue. The arrears on the 6 per cent. cumulative income bonds ($3,532,757) will be satisfied by the allotment at par of 10-year unsecured notes bearing no interest but provided for by a sinking fund to the extent of $200,000 every half year. The holders of the 7 per cent. cumulative preference shares (the arrears of dividend on which amount to $5,670,000) are to receive new 4 per cent. cumulative redeemable second preference shares in the proportion of $95 of new shares for each $100 of existing shares. The new preference shares will be redeemed by means of a sinking fund. The board also proposes to convert the ordinary shares into shares of no par value. If the scheme is approved, it is thought that the company will be able to pay the current dividends on the two classes of preference shares and still have a surplus.

Vickers, Ltd.

Speaking at the annual meeting on April 29th, the chairman (General Sir H. A. Lawrence) referred to the losses engendered by the industrial disputes of the past year and to the steps taken by the directors to get rid of unremunerative subsidiary concerns. He said, *inter alia*, that the company's interests in Vickers-Petters, Ltd., had been sold; that company had not given any return for some years, and had involved additional finance. They had closed down the British Lighting and Ignition Co., Ltd., and the sale of the assets had realised more than the written-down book value. The Metropolitan-Vickers Electrical Co., Ltd., continued to progress; the overseas business had shown expansion and the net profit for the year had improved. Metro-Vick Supplies, Ltd., which had not shown the results which should have accrued from that branch of the business, had been reorganised, and now showed good possibilities of development. The chairman denied that there was any intention of amalgamating the company's business with that of Sir W. G. Armstrong, Whitworth & Co., Ltd., but said that conversations had taken place in order to ascertain whether some working arrangement could be made between similar departments of the two companies with a view to more economical production. There was, at present, nothing definite to report.

Chelsea Electricity Supply Co., Ltd.

The annual meeting was held on April 28th. Mr. W. R. Davies (chairman), who presided, in moving the adoption of the report and accounts (ELEC. REV., April 22nd, p. 651), referred to the reorganisation, and said that their dividends in future would be limited to 1s. 9.3d. per share until 1931, and to 1s. 4.8d. per share for the forty years thereafter, unless the reduction of charges below the standard price permitted the payment of more. Allowing for the bonus, the dividends stated represented 14.2 and 11.2 per cent. respectively on the old capital. After referring to the increased expenses of the past year, Mr. Davies said that the cost of electricity would be lower this year, and that would enable them to effect important reductions in their charges to consumers. The benefit of generation at large stations had still to be felt, but he was sure that the policy would be justified and that the consumers would benefit materially. That in turn would lead to an acceleration in the rate of increase of business. The report and accounts were approved and a resolution increasing the directors' remuneration was adopted.

Notting Hill Electric Lighting Co., Ltd.

The report for 1926, which is to be presented at the annual meeting on May 10th, shows a profit of £64,336 and after making various allocations, including interest, sinking fund, income tax, and £1,386 to the staff under the co-partnership scheme, there remains a balance of £29,113. After paying the preference and standard ordinary dividends, there is a balance of £7,594. Referring to the capitalisation of the reserves, the report says that the amount standing to the credit of the special reserve fund for capitalisation is £76,216, and to that will be added the company's share of the free reserves of the Kensington and Notting Hill joint undertaking Until the latter figure has been ascertained it is not proposed to deal with the capitalisation. It is proposed to issue during this year the balance of the preference shares (£56,000). With a view to the simplification of the capital account, it is proposed that the deferred shares shall be merged with the free reserves into ordinary shares, and that the two issues of preference shares shall be consolidated and made cumulative. Meetings of all classes of shareholders will be held after the annual meeting to give effect to these arrangements.

Anglo-American Telegraph Co., Ltd.

The report for the past year states that three quarterly dividends of 15s. per cent. on the ordinary stock, and £1 10s. per cent. on the preferred stock, and final dividends of £1 10s. per cent. on the ordinary stock, £1 10s. per cent. on the preferred stock, and £1 10s. per cent. on the deferred stock have been paid. These payments, together with £52,500 for income tax, absorbed altogether £262,500, being the rent paid by the Western Union Telegraph Company for the year. The balance at credit of revenue account (£72,977) includes £7,352, interest received, and the balance of £65,625 is available for the payment of dividends for the quarter to March 31st, 1927. The directors have decided to apply the accumulated interest above mentioned, amounting to £7,352, to the creation of a capital reserve fund, and to credit that fund with all future interest received. The death of the chairman, Sir Herbert S. Leon, Bt., is recorded. Mr. R. H. Benson has been appointed chairman, and Lord Cochrane of Cults has been elected a director.

Brompton and Kensington Electricity Supply Co., Ltd.

Mr. H. R. Beeton (chairman) presided at the annual meeting on April 28th, and in presenting the report and accounts (ELEC. REV., April 22nd, p. 651), said that, although under the new conditions comparison was difficult, the company had continued to progress. They had not yet been able to enjoy the benefits of consolidated generation, but they had achieved a low relative cost per kWh generated. The general effect of the altered conditions had been to extend their

tenure until 1971. Up to 1931 the dividend on the present ordinary capital would be 8¾ per cent. and 7 per cent. thereafter, with the possibility of an additional benefit under the provisions of the sliding scale. The consumers were now even more interested in the progressive development of the undertaking, and he would urge upon them that the more electricity they used the cheaper it would become. They claimed to be pioneers in the provision of electricity for domestic purposes, and their showrooms contained a display of appliances unrivalled among supply companies. They had taken steps to form a staff superannuation fund; that would act as further incentive to the staff to promote the prosperity of the company. The report and accounts were adopted and additional remuneration was voted to the directors for their work in connection with the London Electricity (No. 2) Act, 1925.

West London and Provincial Electric & General Trust, Ltd.

The report for the 15 months ended March 31st last states that the remainder of the capital has been issued. The profit and loss account shows receipts of £14,621, and there is a profit of £10,918, to which is added £2,379 brought forward, making £13,297. It is proposed to pay a final dividend of 5 per cent., making 8 per cent. for the period, to place £2,500 to reserve, and to carry forward £3,059.

The annual meeting was held on April 29th. Mr. H. Kahn presided, and in moving the adoption of the report said that the balance sheet could not be compared with that for the previous period, nor could it be taken as a guide to future accounts. Over 67 per cent. of the company's investments came under the heading of electric light, power and tramways, the total value being £115,624. Included in that were £2,860 debentures of the Chiswick Electricity Supply Corporation, and practically the whole of that company's ordinary capital. Thus the future of the trust was largely bound up with that of the Chiswick Company; the latter had continued to make substantial progress and was an asset of great value.

Calcutta Electric Supply Corporation, Ltd.

The directors' report for 1926 shows that the amount of energy sold by the company rose from 100,587,227 kWh to 108,895,477 kWh. The net revenue, after providing about £137,000 for depreciation and renewals, was £330,240, as against £307,369 in 1925, when £115,000 was allocated to depreciation and renewals. The addition of £33,048 brought forward makes available £363,288, and after providing for debenture interest, preference dividend, &c., it is proposed to transfer £50,000 to reserve, £3,000 to insurance fund, and £1,000 to retiring gratuity fund; a final ordinary dividend of 7 per cent. is recommended, making 12 per cent. for the year, leaving £31,600 to be carried forward. It has been decided to capitalise part of the reserves and to issue 136,671 new ordinary shares to existing shareholders in the ratio of one to ten, fractions being paid in cash. The meeting was to be held on Wednesday last.

Cork Electric Tramways and Lighting Co., Ltd.

The annual meeting was held on April 22nd. Mr. A. R. Monks, who presided, said that owing to the high prices ruling during the strike they paid for their coal supply £14,600 more than they would have paid under their contracts. Of this amount only £4,500 was passed on to consumers, so that the net cost of the coal strike to the company was £10,000. The lighting and power business again showed a satisfactory increase. The Free State Electricity (Supply) Bill, 1927, gave exceedingly wide powers to the Electricity Supply Board which it was proposed to create to control the distribution of electricity in the Free State, and consequently the company's future was rather uncertain. The Electricity Board might desire them to take a bulk supply or it might decide to acquire the undertaking, which in the terms of the Bill they might purchase on the basis of paying a sum equal to the fair value of the undertaking as a going concern.

British Electric Traction Co., Ltd.

The directors propose to issue to ordinary stockholders, in the form of deferred ordinary stock, a portion of the amount standing to the credit of the undivided profits account equal to 10 per cent. on the ordinary stock. The existing ordinary stock will be converted into an 8 per cent. non-cumulative preferred ordinary stock, and the new stock will receive anything which but for the scheme the ordinary stock would have received above 8 per cent. While the preference stockholders remain unaffected, if the scheme is adopted they will receive for the past year an additional 2 per cent., making 8 per cent. for the year.

Stock Exchange Notices.

The undermentioned have been ordered to be officially quoted:—

American Telephone and Telegraph Co.—$13,639,500 capital stock.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Ascot District Gas and Electricity.—357 six per cent. preference "E" shares of £10 each, fully paid, Nos. 13,144 to 13,500.

Chiswick Electricity Supply Corporation.—100,000 ordinary shares of £1 each, fully paid, Nos. 1 to 100,000.

Companies Struck off the Register.

The names of the undermentioned companies have been struck off the register and they are thereby dissolved:—

B. Barnett (Electrical Engineers), Ltd.
British Generator Co. (1922), Ltd.
British Homo. Wireless Co., Ltd.
Broadcasting Installations, Ltd.
Eclat Electrical Accessories (Paddington) Co., Ltd.
Electronic Devices, Ltd.
Hull Wireless Co., Ltd.
Prior's Television (Parent) Co., Ltd.
Radio Products, Ltd.
Reynard Electrical Co., Ltd.
Wilmore's Wireless, Ltd.
Wireless Enterprises, Ltd.

Mackay Companies.

The report of this group for 1926 records income and profits from investments of $4,922,811. Operating expenses absorbed $296,640, leaving $4,626,171, to which is added a surplus brought in, making $6,771,513. The dividends required $4,611,111, leaving a surplus of $2,160,402. It is stated that during the past 20 years all extensions have been made from reserves and earnings, and in the last six years no less than $25,000,000 has been spent on capital assets, including Atlantic cables. The Atlantic business continues to expand satisfactorily, but the net profit rises at a lower rate owing to the extended use of the low-rate services. The report shows that the group does not fear the competition of the "beam" system, and places great hope in the development of loaded cables.

Lanarkshire Tramways Co.

This company sustained a further loss on working of £11,568 during the past year; this is attributed to motor-'bus competition, local rates, the general strike, and the coal dispute. Several local authorities have prepared by-laws for the regulation of motor-'buses which, if enforced, should eliminate the loss on the company's services. The local rates are partly based on profits made during the period before motor-'bus competition set in, and the debit for the year in this direction was £6,500; the debit for the current year will be less than £1,000.

Reading Electric Supply Co., Ltd.

The revenue for the past year was £84,156, and the gross profit £33,875 (as compared with £39,329 for 1925). It is proposed to pay a dividend of 8 per cent. on the ordinary shares, as in the preceding year, leaving £2,781 to be carried forward. During the year an issue of £150,000 of 6 per cent. debenture stock was made to enable the balance of the 7½ per cent. debenture stock (£93,400) to be redeemed, and to provide further working capital; the issue was fully subscribed.

Provincial Tramways Co., Ltd.

The net revenue for the past year was £14,675, and to this is added £5,784 brought forward, making £20,459. After providing for debenture interest and sinking fund, there is a balance of £15,115. It is proposed to pay the preference dividend for 1924, leaving two years' dividend in arrears, and to place £6,000 to general reserve (making £32,787), leaving £3,116 to be carried forward. The capital expenditure during the year was £14,343, and it is estimated that £12,000 will be expended during the current year.

Swansea Improvements and Tramways Co.

The revenue for the past year was £137,160 (against £149,986). After meeting all expenses, including £20,000 for renewals, there is a balance of £7,560 (as compared with £13,847 in 1925). A balance of £7,968 brought forward is added, making £15,528. It is proposed to repeat the dividend of 6 per cent. and to carry forward £8,130. The reduction in revenue is, of course, attributable to the general strike and coal dispute.

International Automatic Telephone Co., Ltd.

An extraordinary meeting was held last week, when special resolutions were confirmed authorising the creation of 200,000 preference shares of £1 each; and providing for the cancellation of the option of Messrs. Theodore Gary & Co. upon the 170,338 issued preference shares, substituting an option to subscribe for an equivalent number of new shares at the same price, *viz.*, 21s. 6d. each.

Ever-Ready Co. (Great Britain), Ltd.

The directors recommend a final dividend of 5 per cent. on the preference shares, making the maximum of 10 per cent. for the year. The ordinary shares (including those issued in November last) are to receive a dividend of 25 per cent. The old shares received an interim dividend of 10 per cent.; the total is thus 35 per cent. for the year, as against 25 per cent. last year. The net profit was about £174,500 against £139,500.

Newmarket Electric Light Co., Ltd.

The report, which was presented at the annual meeting on April 25th, showed a net profit of £2,346, plus a balance brought forward of £608, making £2,954. A dividend of 8 per cent. was declared and £829 was carried forward.

New Issues.

County of London Electricity Supply Co., Ltd.—An issue of £4,250,000 of 5 per cent. debenture stock was made this week. The issue price was £96 per cent., and the stock is redeemable in 1972 at par. The stated objects of the issue were:—"To repay the loan from the company's bankers to provide funds for the extension of the Barking power house, and for further capital expenditure in the company's areas inside and outside the Administrative County of London, in order to cope with the developments taking place in every direction."

Rushden and District Electric Supply Co., Ltd.—The directors are offering to existing shareholders or their nominees an issue of 10,664 £1 shares at 24s. per share, in proportion to their holdings. The list closes on May 17th.

Urban Electric Supply Co., Ltd.

The balance of the 1926 net profit and loss account, after providing for debenture interest, &c., is £90,171. To this is added £18,683 brought forward, making £108,854. A total of £1,524 is devoted to the purchase of funded dividend certificates, £35,000 is placed to depreciation reserve, and £15,000 to general reserve. After paying a dividend of 7 per cent. on the ordinary shares, a balance of £19,548 is carried forward. Meeting: May 12th.

Columbia Gas and Electric Corporation.

The gross earnings for the year ended February 28th last were $92,850,286 and the net operating earnings $31,581,455, to which were added miscellaneous receipts of $3,460,444. The net income was $25,693,548. The directors have declared a quarterly dividend of $1.25 per share on the no-par value common stock, payable May 15th.

West Gloucestershire Power Co., Ltd.

The report for the past year shows that in the face of the industrial troubles of the period, the energy sold rose by 264,226 kWh to 7,423,673 kW, and the revenue by £8,363 to £45,760. During the year 50,000 participating preference shares of £1 each were issued, 30,000 of them to existing shareholders at par.

Craigpark Electric Cable Co., Ltd.

Out of the profit for the past year £2,000 is written off for depreciation, and it is proposed to pay a dividend of 7½ per cent. (against 12½ per cent.), leaving £1,585 to be carried forward.

City of Buenos Ayres Tramways (1904), Ltd.

A dividend of 1s. 3d. per share has been declared for the quarter ended March 31st.

German Companies.

The *Concordia Electricity Company*, Dusseldorf, reports net profits of 221,000 marks, against 239,000 marks in 1925, the dividend remaining at 5 per cent.

The report of the *Duisburg Cable Works Company* reports a net profit of 649,000 marks, as compared with 652,000 marks in 1925; the dividend is 8 per cent.

The *Emag Electricity Company*, Frankfort-on-Main, is increasing its dividend from 5 to 6 per cent., the net profit for 1926 having been 68,000 marks, against 53,000 marks.

The *Dr. Paul Meyer Company*, Berlin, reports net profits of 251,000 marks for 1926; the dividend is 6 per cent.

The *Mix and Genest Telephone and Telegraph Works Company*, Berlin, is paying 9 per cent., as against 6 per cent. in 1925. The ordinary share capital is to be raised by 2,500,000 marks to 9,500,000 marks.

The *Company for Electrical Undertakings*, Berlin, has declared a dividend of 10 per cent., as in 1925.

The *German Cable Works Company*, Berlin, reports that the works were well employed in 1926, and although sale prices were low, the value of the turnover was almost 50 per cent. greater than in the previous year. Besides the home contracts, large orders for h.p. and l.p. cables were received from abroad. A dividend of 6 per cent. (as in 1925) has been declared out of net profits of 381,000 marks.

The *Hartmann and Braun Company*, Frankfort-on-Main, states that a perceptible improvement took place in the second half of last year, but the working results could not be considered satisfactory. The net profits amounted to 216,000 marks, as compared with 122,000 marks in 1925, and the dividend is 8 per cent., as against 5 per cent. in 1925.

The *North German Cable Works Company*, Neukoln, reports net profits of 229,000 marks, as against 25,000 marks in 1925, and the dividend is 8 per cent., as against *nil* for 1925.

The *Felten and Guilleaume Carlswerk Company*, Cologne-Mulheim, reports that products last year included 50,000-V cables; and the development of cables for over 100,000 V had so far progressed that it was hoped to be able to introduce them on a large scale shortly. The company also laid last year a telephone and telegraph cable of a length of 165 kilometres between Holland and England, and executed large deliveries of telephone cable for other countries. The accounts show net profits of 4,102,000 marks, as against 4,077,000 marks in 1925, and the dividend is again 6 per cent.

The *Bergmann Electricity Works Company*, Berlin, reports net profits of 3,160,000 marks, as compared with 2,600,000 marks in 1925, and the dividend is 8 per cent., as against 6 per cent. in 1925.

French Companies.

The *Compagnie des Forges et Ateliers de Constructions Electriques de Jeumont* recommends an increase in the dividend from 20 fr. to 27.50 fr. per share for 1926; the *Compagnie Continentale Edison*, from 37.50 fr. to 40 fr.; the *Compagnie Générale de Télégraphie Sans Fil*, from 45 fr. to 50 fr.; the *Compagnie Radio-France*, from 30 fr. to 46.80 fr.; and the *Compagnie Radio-Orient*, from 30 fr. to 35 fr.

The *Société Française des Electrodes*, Lyons, proposes to pay a dividend of 12 per cent. for the past year.

The *Société de Construction Electrique*, Lyons, has decided to distribute 5 fr. per share out of the available surplus of 354,000 fr. for 1926.

The *Compagnie Française Thomson-Houston*, Paris, reports a credit balance of 30,326,000 fr. for 1926, as compared with 11,754,000 fr. in the previous year. It is proposed to apply 18,000,000 fr. to writing down purposes and to carry forward the balance of over twelve millions. If this recommendation is adopted the directors intend to pay a dividend of 20 fr. per share in the middle of this year.

Belgian Companies.

The *Société des Ateliers de Constructions Electriques de Charleroi* reports a net credit balance of 9,065,000 fr. for 1926, as against 7,159,000 fr. It is proposed to pay a dividend at the rate of 25 fr. (10 per cent.) per share as compared with 20 fr. in 1925.

The *Compagnie Générale de Railways et d'Electricité*, Brussels, reports net profits of 10,684,000 fr. for 1926, as compared with 7,945,000 fr. The dividend is 42.50 fr. per ordinary share, as against 40 fr.

The report of the *Société Générale Belge d'Entreprises Electriques* states that the net profit for 1926 was 7,420,000 fr., as against 4,783,000 fr. in 1925. It is proposed to pay a dividend of 60 fr. per share, against 55 fr.

Dutch Company.

The *Nederlandsche Kabelfabriek Maatschappij*, the Hague, reports a net profit of 1,082,204 guilders for the last financial year, as compared with 883,359 guilders in 1925. The dividend on the capital of 2½ million guilders is being increased from 21 to 24 per cent.

Austrian Company.

Brown, Boveri and Company, are paying a dividend of 12 per cent. out of net profits of 550,000 schillings, as compared with 10 per cent. in the previous year.

Stocks and Shares.

Monday Evening.

So long as monetary conditions give encouragement to the idea that there may be a reduction to 4 per cent. in the Bank Rate, so long is it certain that prices of investment stocks will remain what the Stock Exchange terms "good." The lowering of the minimum to 4½ per cent. on April 21st gave the signal for the unloosing of a flood of new issues; many of them of the best class and of substantial extent.

The County of London Electric Supply Company has offered 4¼ million pounds of 5 per cent. debenture stock at 96. The stock will be redeemable at 100 in 1972. Ample security, the prospectus shows, exists for the stock and its interest. The latter works out to £5 4s. 2d. per cent. on the money at the issue price of 96. The amount offered is a large one, but the County of London Electric board shows its faith in the public appreciation of the investment by the fact that the underwriting commission mentioned in the prospectus is no more than 1¼ per cent. For more than a year past there has been lively curiosity as to the shape which the long-expected County issue would assume, and occasional bouts of speculation occurred on the circulation of rumours now set at rest by this week's prospectus. No changes have occurred in the company's ordinary and preference shares.

Electric Supply Corporations are a strong market, with a net rise of 1s. 9d. to 32s. ex dividend. London shares are steady. Holders of electricity supply investments are watching with keen interest the anger aroused amongst gas consumers at the remarkable increase in most customers' bills presented for the March quarter. The gas companies' innocent surprise at the protests is observed with a certain twinkle of the eye. One result will infallibly be to turn public attention to electricity for cooking, and the practical exposition of its advantages, dwelt upon in the supplement to last week's Electrical Review, makes useful propaganda at a moment when gas customers are feeling sore and indignant with their current accounts.

The tendency of investment to look ahead in the purchase of shares in the provincial undertakings is again exemplified in to-day's price-lists. Newcastle-on-Tyne ordinary are 1s. up, Lancashires 6d., and several others have gained the turn.

Urbans have put on 1s. 6d., with a rise to 27s., although the dividend of 7 per cent.—the same as that of a year ago—led to a little disappointment. It had been thought that 8 per cent. might have been declared. Edmundsons at 26s. 9d. have gained a few pence.

Chiswick Electric Supply ordinary are maintained at 53s. 9d., at which price the return on the money is nearly 6 per cent. on the basis of last year's dividend of 16 per cent. This rate was paid also in 1925, following 15 per cent. for 1924 and 12½ per cent. for 1923. Richmond (Surrey) Electric ordinary can be bought at 30s., yielding 6 per cent. on the 1926 dividend of 9 per cent., which compared with 10 per cent. in each of the three preceding years. The reduction last year was due to the effects of the coal strike.

The new County of London 5 per cent. debenture is comparable to London Power 5 per cent. debenture, obtainable at 97½ ex the interest due a month ago. There is a small amount of Llanelly and District 5 per cent. first mortgage debenture on offer at 93, June and December interest, yielding £5 7s. 6d. on the money.

Tokio Electric 6 per cent. sterling bonds have shed two or three points, to 87½, in consequence of the recent financial crisis that disturbed the price of most Japanese securities.

Investment demand is at work amongst the cable stocks and shares. Eastern ordinary, Eastern Extensions and Globes are all better, although Globe preference parted from its gain of a week ago. Indo-Europeans are firm at 45½, the recent meeting producing a good impression. The chairman mentioned the curious fact that as there is no intermediate transmission, the actual time of transit of telegrams was practically nil between London and Karachi. The re-opening of the Black Sea cable, which will restore direct communication between Odessa and Constantinople, has not yet become practicable. Anglo-American Telegraph stocks are both better, on the issue of the report. The feature amongst telephones is a fresh jump in United River Plates, to £9. Bogota Telephones are firmer at 35s., and the company is making such progress as to suggest that the shares are a sound speculative investment of the lock-up order.

It may be noticed that we have removed Cuba Submarines from our weekly price-list. So little public interest is now taken in the shares that no purpose appears to be served by their regular quotation.

Wireless shares are quiet, and with the subsidence of the recent agitation, Marconis are left at 17s. 6d., nor is any fresh attention likely to be directed to them until rumour begins to sport with the dividend possibilities which are expected to materialise in the late autumn. Johnson and Phillips announce a profit for 1926 of £115,100, against £209,900 in 1925, and £162,000 in 1924. The dividend of 7½ per cent. makes 12½ per cent. for the year, against 17½ per cent., of which 7½ per cent. was paid on a smaller capital than the present £600,000. Reserve get nothing this time, and the carry-forward of £82,475 is £8,600 more than was brought in. The price of the shares remains at 47s. 6d., at which the return is 5¼ per cent. on the money. Report has it that the company is now very busy. Ever Ready (Great Britain) has done well, making a profit of £174,500 in the year just ended, an increase of £35,000 over 1925-26, and nearly £70,000 more than in the previous twelve months. The ordinary shares, after a dip to 4¼ sellers, braced up to 4⅜ on the dividend of 25 per cent., making 35 per cent. for the year. The 7 per cent. participating preference, which will receive their full 10 per cent., are quoted at 29s. 6d.

Brazilian Tractions, insatiably bought by Brussels, are up 3¼ at 143 ex dividend. Barcelona Tractions, on the report mentioned last week, are better at 53, and Sidros have gone ahead to 17¼.

Calcutta Electric Supply publishes an excellent report, the figures being extremely good. The previous dividend of 12 per cent. is to be repeated, and a bonus distribution, of one share for every ten shares held, will be made from reserves. The price of the old is better, on the announcement, at 44s. Calcutta Trams stand at 16s. La Plata Trams eased off to 4s. 1½d. The preference, at 20s., are ex the dividend of 1s. 6d. Anglo-Argentines reacted after their brisk advances. On the other hand, the Mexican Utility group is better, and fairly active speculation in Mexican Light preferred shares has raised the price to 108. It is of some interest—if only by way of showing what we can miss—to recall that Brazilian Tractions a year ago were 93, or 50 points below their present level.

Substantial improvements have been secured by the Underground Railway stocks, in which Metropolitans and Metropolitan Districts are included. Districts are 2½ to the good, and now stand no more than a point below "Mets.," while Underground £1 shares at 18s. 6d. have added another 1s., and occupy the proud position of paying 1⅝ per cent. to a purchaser. That the dividend will be shortly increased is of course taken for granted. Central London ordinary at 71 is 1 higher.

Babcocks have regained the dividend deducted last week from the price, and are 55s. ex dividend. Iron, coal and steel shares are mainly better, upon the improvement shown by the Vickers report and the hopes of better trade in the industry as a whole. The rubber share market is inanimate, and the reduction in the exportable allowance to 60 per cent., which comes into force this month, has been almost ignored so far as the prices of shares are concerned.

Swiss Foreign Electrical Trade.

THE following statistics, showing the import and export trade of Switzerland in electrical and allied goods in 1926 have been taken from the recently-issued official trade returns. The figures for 1925 have also been given, and notes added of any increases or decreases. The returns show the most important but not all the countries of origin or destination of the goods. An asterisk has been placed where the absence of a figure means not necessarily that there has been no trade but that it has been of comparatively slight importance in the year indicated; in such cases the precise increase or decrease cannot be given.

The sixteen classes of imports which are set out in our list form an aggregate of 21,088,000 fr. for 1926, as compared with 19,940,000 fr. in the preceding year. The most important class, telegraph and telephone apparatus, is the one which showed the greatest rise. The class second in order, unspecified electrical apparatus, showed the greatest decrease. Great Britain's share of the imports of the classes shown fell from 2,831,000 fr. in 1925 to 2,089,000 fr. in 1926; this decrease was accounted for mainly by the decline in our supplies of unspecified electrical apparatus. Switzerland's electrical exports in the fifteen classes shown in the list increased in the aggregate from 73,159,000 fr. in 1925 to 75,030,000 fr. in 1926. There was a small decline in the largest class, *viz.*, dynamo-electric machines and electric transformers of all kinds, and the value of exported meters also fell. The machinery and unspecified apparatus classes showed increases. The share of the United Kingdom in Swiss exports of the classes specified declined from 6,574,000 fr. in 1925 to 5,786,000 fr. in 1926. The figures show that Switzerland has a very substantial balance in her favour in her foreign electrical trade—of the order of 50 million fr. in each of the two past years. This is reflected in the figures of the trade with this country; Switzerland's exports to Great Britain exceeded the imports from this country by about 3,700,000 fr. in each year.

* Not specified.

The F.B.I. and the Abolition of the D.O.T.

The proposed abolition of the Department of Overseas Trade was considered by the Grand Council of the F.B.I. on April 27th, and resolutions were passed recording the appreciation of the Federation of the valuable services rendered to industry and commerce by the Department and its officers abroad. The Federation considers that the maintenance of many of the functions of the D.O.T. is essential, as their abolition would seriously prejudice industrial and commercial interests, and in particular that it is essential that adequate arrangements should be made for the collection and recording by the Government of information regarding such subjects as foreign tariffs, Customs regulations, &c. The hope was expressed that the services of the commercial diplomatic officers and trade commissioners abroad should be retained. It is realised that there is a need for the strictest economy in Government expenditure, and the F.B.I. offered to help the Government to secure economy with the least possible injury to national interests. The Federation desires to have an early opportunity of laying its views before the Government, and of ascertaining its proposals as to the future of the Department. A committee, chosen from amongst the past presidents of the Federation and members of the Overseas Committee, has been appointed by the Council to carry the matter further.

Modern Stage Lighting.

Some interesting features of the new equipment introduced by Messrs. Holophane, Ltd.

FROM the scientific point of view theatre stage lighting has been sadly neglected in the past, with the result that to-day in many theatres obsolete and crude equipment is still to be found. Some recent developments in this connection should, however, contribute towards remedying this, including the equipment recently introduced by Messrs.

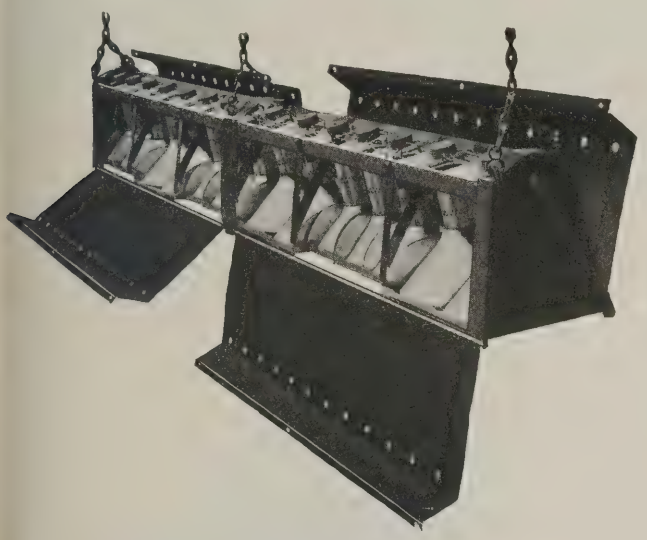

Fig. 1.—Holophane Stage-lighting Batten.

Holophane, Ltd., of which we have obtained the following particulars. This new apparatus is designed to assist, and not neutralise, the artistic efforts of the craftsmen, the required intensity of light being obtained from comparatively only a few lamps used in conjunction with scientifically designed reflectors, which utilise and distribute the light in such a manner that only a very small proportion of the current consumption usually required for the open-type batten is necessary, and which give a good intensity and distribution of light in the direction of the wings.

The equipment is made up in two sizes in standard lengths of 4 ft., the width of the larger size being 11 in. The actual lighting fittings are contained in an iron frame-

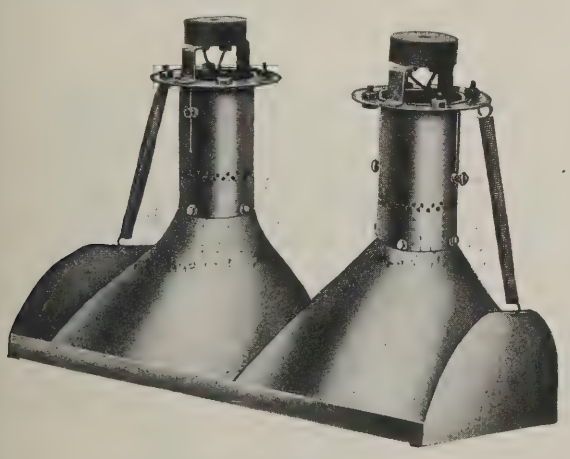

Fig. 2.—Special Reflector Unit.

work, fig. 1, about which are folded protecting doors, covering the whole length of each section, which are hinged at the bottom so as to allow them to drop downwards. The doors are fastened at the top by special clips, and can be opened in a few seconds. With the exception of the bottom of the equipment, the whole is enclosed by the doors, which are quite plain, so that the exterior is free from any projections which might get caught in the scenery.

The lampholders are insulated from the metal of the casing, while the insulated cables connecting them to the terminal blocks are additionally protected by insulating beads. They are so constructed that they can be taken out together with the connecting cables without disturbing the supply circuit; alternatively, a circuit can be rewired without touching the holders or the connecting cables.

Fig. 2 shows a special reflector-unit which can be supplied for ensuring that, in the event of a lamp burning out, the distribution of light will remain the same, and so produce no bad effects on the scenery. Similarly, by a combination of these reflectors the bad effects from the failure of a whole circuit or a number of individual lamps can be guarded against.

Holophane clear prismatic glass reflectors, specially designed for the conditions under which they are employed, are installed in the special casings. Fig. 3 shows one of these reflectors, the construction of which, it is claimed, ensures that the rays of light are split up and diffused in such a manner as to avoid the striation effect due to the image of the lamp. Further, it is claimed that the light distribution is such that no matter whether a backcloth is fixed close to a batten or at some distance away, it may be lighted efficiently from top to bottom without assistance from floats or proscenium drops. Each reflector is provided with a special opaque covering shrunk over the outside, fig. 3, which keeps all dust and dirt from the prismatic surface, and at the same time prevents the glassware from being shattered, even if it is violently knocked. The reflector housing is made up of a terminal block, canopy, lampholder, reflector, and a frame at the base for the colour screens. The units can be placed in any part of the batten, and the spacing between them adjusted to suit the requirements of the par-

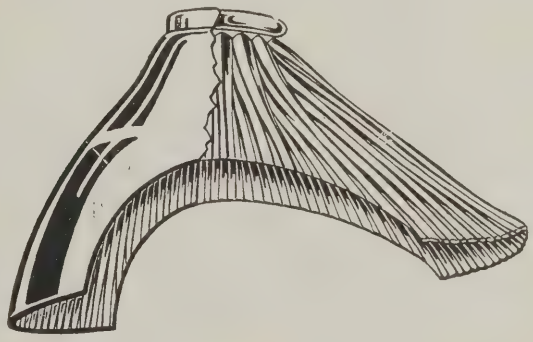

Fig. 3.—Prismatic Glass Reflector.

ticular stage to be illuminated. The parts of each unit may be rapidly dissembled, but it is impossible, it is claimed, for them to come apart of their own accord. Each unit is provided with a simple focusing device which ensures that the best results are obtained from the reflectors and allows of the use, within certain limits, of different sizes of lamps.

It is interesting to note that the advantages and features of the apparatus described above have been embodied in Holophane footlight equipment. The reflectors are built into similar units and housed in a suitable framework. Of course there are certain modifications in this apparatus to meet the necessarily different requirements.

A Severe Lamp Test.

The Edison Swan Electric Co., Ltd., has sent us a copy of a letter it received recently from the Sign Construction Co., Ltd., which indicates how the modern electric lamp will withstand long and hard service. Referring to some Royal Ediswan lamps which were picked out at random from a sign employing about 400 lamps, the Sign Co. mentions that they have been working for approximately 4½ years with an average illumination period of 1,500 hours per annum. The lamps have been used in a horizontal position and subjected to considerable traffic vibration and the usual rough handling during periodical overhauls of the sign. It is calculated that each lamp had been flashed at least 250,000 million times. The lamps had lost nothing of their illumination and there was no appreciable filament sag.

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

A Treble-Scale Miniature Instrument.

Fig. 1 shows a new miniature milliammeter which has been put on the market by Messrs. A. H. Hunt, Ltd., Tunstall Road, Croydon. The normal range of the instrument is, as indicated on the scale, 0-5 mA; but by means of two

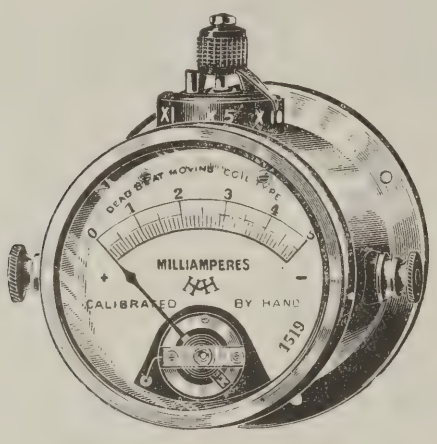

Fig. 1.—Miniature Milliammeter.

shunts which are enclosed within the instrument case, and which are controlled by the indicating knob at the top, twice or five times the normal reading range can be obtained.

A Rectifier for Ultra-Violet Apparatus.

A distinct disadvantage to the user of electro-medical apparatus for the production of ultra-violet rays has been the cost of the necessary converting equipment in cases where only an a.c. supply is available. This has to a considerable extent been overcome by means of a new rectifier apparatus which has been put on the market by the Medical Supply Association, Ltd., 167-185, Gray's Inn Road, London, W.C.1. The set embodies a 4-cell electrolytic-type rectifier, the cells being connected up in the well-known Gratz method, an auto-transformer, and the necessary switchgear and connecting terminals. The cells are housed in a convenient polished-wood box, to the outside of which is attached the transformer. The apparatus is used in conjunction with a specially

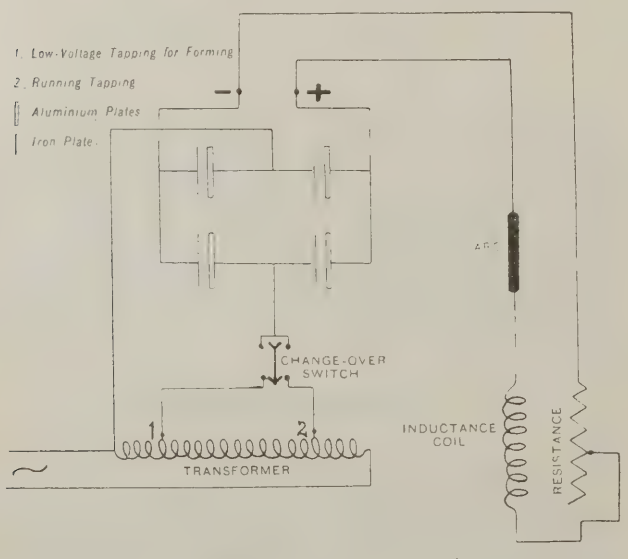

Fig. 2.—Rectifier and Lamp Connections.

designed induction coil, placed in series with the arc, which smoothes out the d.c. wave from the rectifier sufficiently to allow either mercury-vapour lamps or tungsten arcs to work satisfactorily on it. Fig. 2 represents the arrangement of the various parts of the rectifier and the lamp when in use. The function of the auto-transformer is to supply a low pressure for forming the plates before use; the change-over switch provides for the necessary alterations of the connections.

Illuminated Flowers.

Artificial flowers with small electric bulbs concealed in the blossoms are a recent creation, for the decoration of car interiors, of the General Electric Co., Ltd., Magnet House, Kingsway, W.C.2. They are supplied in sprays consisting of either one iris, two roses, three cape gooseberries, three daffodils, or three fuchsias. The whole of the material and labour employed in the manufacture of these illuminated flowers is British. When unlighted they are claimed to be indistinguishable from natural blossoms. They are supplied with standard Osram steering-pillar lamps. The current consumption is a negligible quantity, being in most cases less than that of one sidelight lamp. The illumination from one spray is claimed to be sufficient to render entering or alighting from the car a safe procedure, and when placed in the rear corners of the saloon, they furnish an adequate reading light.

An Electric Vulcanising Bath.

We have received from Messrs. Electric Fires, Ltd., Heatrae Works, Norwich, some particulars of an electric paraffin-wax vulcanising bath, fig. 3, which they have recently placed on the market. It is intended primarily for use in

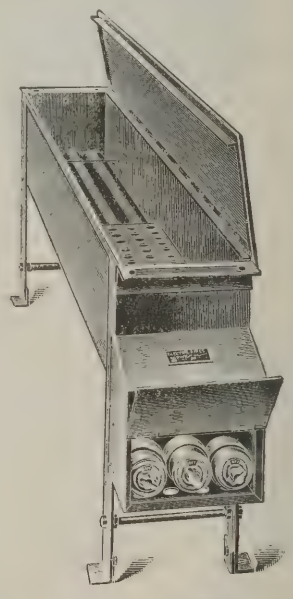

Fig. 3.—Electric Vulcanising Bath.

mines and large factories where repairs to cables have to be carried out on the job. The apparatus consists essentially of a welded steel trough with three 2-in. steel tubes fitted near the bottom, in which are contained removable heating units. The tubes are covered by a perforated grid to prevent the cables coming into contact with them. A light-steel cover is provided for the bath; this is not hinged as suggested by the illustration, but is entirely removable by means of two handles. The heating elements are controlled by 3-heat switches, which are conveniently housed in a box attached to the side of the apparatus. The internal dimensions of the bath are 5 ft. by 9 in. by 10 in. deep. The maximum loading is 9 kW, and the elements are of equal capacity. It is claimed that on the total loading the wax can be melted and raised to 300 deg. F. in one hour. The bath can be supplied to suit any supply pressure up to 600 V, d.c. or a.c. Cable clamps are provided at each end of the trough.

An Egg-Cleaning Machine.

Another use, this time in the cleaning of eggs, has recently been added to electricity's long list of practical applications. The new method, it is said, has greatly reduced the cost of handling and packing eggs at Petaluma, California, U.S.A., a city frequently referred to as the "Nation's Egg Basket." It is in adding that final touch of perfect cleanliness that electricity has made its latest triumph; formerly this was done by hand, an experienced egg cleaner being able to perform ablutions upon about seven cases of eggs a day. After much experimenting, engineers of the General Electric Co. of America applied an electrically operated centrifugal compressor which directs a blast of sand upon a continuous procession of eggs, moving on an automatic conveyor. The blast

f sand removes all extraneous substance immediately, and mparts a fine, even finish to the most untidy egg. The irect results of this innovation in the egg industry have been o increase the speed of cleansing eggs by 80 times, to reduce reakages to a minimum, and to do a much better job—in hort, to place cleaner and finer eggs in the kitchens of merica.

A Double-Time-Lag Device.

A recent production of Mr. GEORGE ELLISON, Perry Barr, Birmingham, is an adjustable double-time-lag device, figs. and 5, for motor-control circuit breakers. This is designed to vercome the difficulty where the setting is such as to restrain he releases for a time long enough for the motor to run ıp to speed, but the time is excessively long on ordinary verloads. The apparatus is of the ordinary oil-dash-pot type, ut has a by-pass valve fitted in position. The valve closes nder the relatively heavy pull caused by the motor-starting urrent, and this action has the effect of increasing the time f retardation long enough for the motor to run up to speed. When the heavy starting current has subsided, the valve

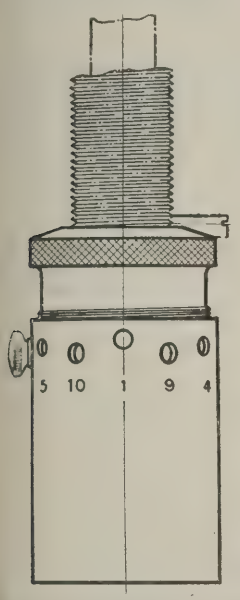

Fig. 4.—Double-Time-Lag Device.

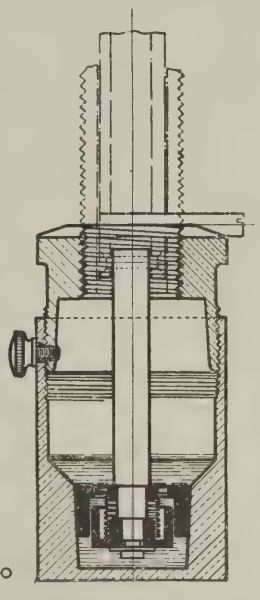

Fig. 5.—Sectional View.

n the piston opens, when the piston is able to rise in a reasonably short time on normal overloads. As the lag has an inverse time element both during starting and running, it releases almost instantaneously on short circuit under both conditions. The device should prove useful on circuit breakers protecting coal cutters, where peaks occur of the magnitude of starting currents, but the breaker must not trip unless the excessive load is sustained. A number of different settings permit a wide range of retardation to be obtained, a screw being provided to lock the cylinder in any desired setting.

An Electric Bathroom Fire.

The accompanying illustration, fig. 6, is of the "Xcel" bathroom fire, a recent introduction of MESSRS. SIEMENS AND ENGLISH ELECTRIC LAMP CO., LTD., 38-39, Upper Thames

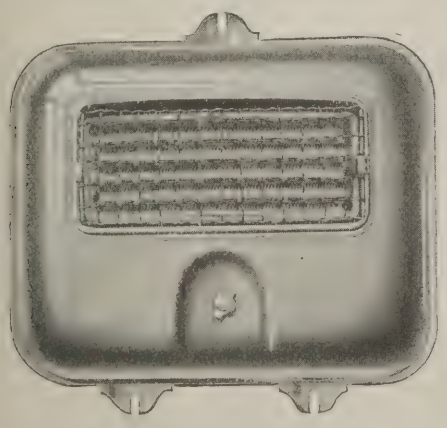

Fig. 6.—Electric Bathroom Fire.

Street, London, E.C.4. It has been designed in response to the demand for a low-consumption fire for use in the bathroom, corridors, and so on. The body is of clean cast-iron, finished in porcelain ivory enamel, and the casing is washable. The switch is sunk into a recess, with only the porcelain knob projecting. The element is of the maker's standard "1607 type, and is protected by a neat guard. Suitable lugs provide for wall fixing, and small projecting pieces keep the fire from the wall. An earthing screw is provided. The loading is 750 W.

Junior Institution of Engineers.

Annual Dinner.

THE annual dinner of the Junior Institution of Engineers was held at the Monico Restaurant, London, on April 26th, when Engineer Vice-Admiral Sir Robert B. Dixon, K.C.B., president of the Institution, took the chair.

Following the honouring of the loyal toast, Brig.-Gen. P. R. C. GROVES, C.B., proposed "The Institution." He referred to the backwardness of this country in developing aviation, and criticised the policy adopted of waiting for a more reliable and economical form of engine. He believed it would be right in this country to subsidise research as was done in other countries. Where an air line had been established along the West Coast of Australia the population had been doubled. Aviation would assist to distribute our population, and as it was developed it would increase the demands on other forms of transport. Scepticism was the greatest barrier to development; it had been to every form of transport. He looked forward to the time when there would be an engineering department in the Air Force, having a trained engineer at its head with a seat on the Council. One of the roots of backwardness had been neglect of the engineering side.

In reply, Mr. R. L. KIRLEW, chairman of the Institution, said that the members of the Institution were associated with all branches of engineering, and were alive to their own possibilities. They would endeavour to solve the difficulties of the Air Ministry. The membership of the Institution was approaching 1,700, and the applications were increasing. The financial position was also good, and they were going ahead.

Mr. H. T. TIZARD, C.B., proposed "The Engineering Industry." He said the engineer was always to the fore in the battle of progress. The hard part of the work often began after the laboratory research was done. At no time was the need for the engineer greater than at present, and at no time were the opportunities greater. The motor cycle and wireless were proving incentives, and great educational work was going on in those directions. Referring to the engineering work of the Navy, he said that Sir R. Dixon had the duty of applying progress to satisfy the exacting demands of the Service; perhaps, if we knew the results achieved, we would pay the taxes more readily.

Sir R. DIXON, responding, said that the engineering industry was passing through an unparalleled period of depression which must soon pass away. One good effect of such a depression was that it showed up the faults and where economies could be effected. The training of engineers and skilled mechanics was of the utmost importance to this country. The status of the engineer depended on his general education. A good general education broadened the view of the engineer and opposed the somewhat narrowing tendency of the purely technical training. It was difficult at present to get apprentices for mechanics; it was necessary to encourage a good class of apprentice in the skilled trades. Engineering in the past had been largely a matter of rule of thumb, but now a technical education was necessary, and also a knowledge of physics, chemistry and metallurgy. Research work was better provided for in other countries, with the result that inventions of British origin were often developed and exploited in other countries. Industry would not prosper without proper co-ordination between employer and employed, and every effort should be made to dissipate any misunderstanding between the parties. Once distrust was overcome the revival of the engineering industry would be remarkably quick.

In proposing "Our Guests," Mr. H. P. WRIGHT, vice-chairman, warmly welcomed the visitors present, and the toast was responded to by Sir Henry Fowler, K.B.E., president of the Institution of Mechanical Engineers, and Sir Murdoch Macdonald, K.C.M.G., president-elect of the Institution. Sir HENRY said that the Junior Institution was giving the engineer the opportunity to express himself. The whole country was depending upon the engineer who was materially concerned with transport. Sir MURDOCH said that in the political world matters of engineering were constantly turning up, and members with interest in the engineering industry should be in the House.

Mr. W. M. HURRELL, vice-chairman, proposed "The Chairman," commenting on the success of the evening, which was due largely to Sir R. Dixon.

In his reply Sir ROBERT paid a tribute to Mr. Riddell, the secretary, from whom he had received great help.

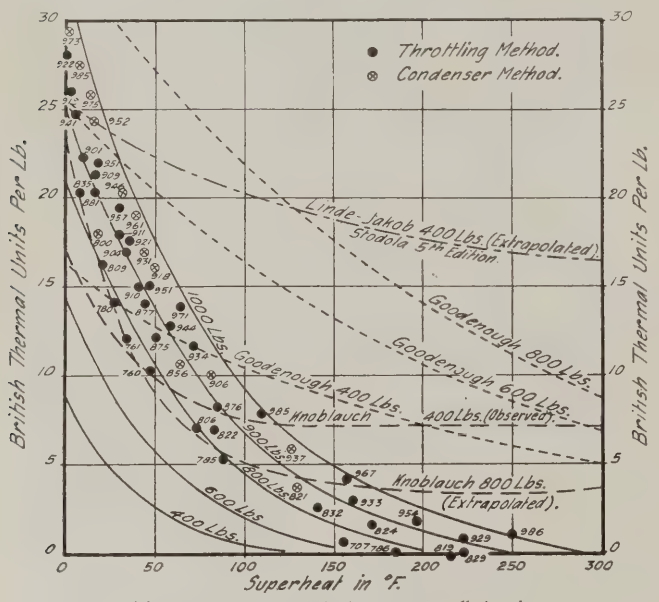
Mr. RIDDELL replied, and commented on the existing comradeship in the Institution ranks.

Sir HENRY FOWLER proposed "Our Hosts," and this was supported by Capt. W. C. Watts, Naval Attaché, American Embassy. Capt. WATTS said that engineering on each side of the Atlantic would progress together. There would be a great impetus to the industry within the next few years.

Mr. W. A. TOOKEY replied to the toast.

Selected artistes rendered items between the speeches, adding to the general cheeriness of the evening.

Economic Value of Increased Steam Pressure



Some results of investigations on the effects of steam-pressure increase on operation and plant efficiencies and costs, with considerations on the selection of particular pressures.

By H. L. GUY.

(*Abstract of a Paper read before the* North-Western Branch *of the* Institution of Mechanical Engineers.)

(*Concluded from page* 699.)
